Emissions from power plants are released into an atmosphere which may be characterized by parameters such as weather conditions, and content of foreign particles. Since, along with source height and topography, these parameters exhibit wide variations, differing interaction processes between emissions and atmosphere are to be expected. The paper discusses the dispersion of emissions from the stack as they may be influenced by turbulence down-wind of high buildings or cooling towers. Parameters influencing the interaction between the stack plume and cooling tower plume are geometry or design of the towers and meteorology. Interaction between the two plumes can be reduced by adjustment of either the towers siting or design. The behaviour of sulfur dioxide and iodine is reviewed and it is concluded that the presence of strong sources of sulfur dioxide can lead to serious problems, since detrimental effects can be quite noticeable, and detailed investigations should be initiated at an early stage of plant design. WATER CHEMISTRY OF THE ST. LAWRENCE ESTUARY,
McGill Univ., Montreal (Quebec). Marine Sciences Centre.
V. Subramanian, and B. D'Anglejan.
Journal of Hydrology, Vol. 29, No. 3/4, p 341-354, April 1976. 6 fig, 4 tab, 30 ref.

Descriptors: *Water chemistry, *St. Lawrence Seaway, *St. Lawrence River, *Chemical analysis, *Estuaries, *Water quality, Saline water, Water properties, Analytical techniques, Salinity, Geochemistry, Hydrogen ion concentration, Trace elements, Water analysis, Tides, Destratification, Erosion rates, Dissolved solids, Heavy metals, Suspended solids, Silica.
Identifiers: *Mineral analysis, Continental runoff.

Based on a total dissolved load of 160 ppm, an erosion rate of 7,056 x 10 to the 10th power kg/year has been calculated for the St. Lawrence basin. The St. Lawrence river contributes 0.24% of the continental runoff to the world oceans. The water chemistry of the estuary suggests the presence of two water masses. While the dissolved silicates and Mn behave conservatively with respect to salinity, Fe shows a strong non-conservative behavior possibly due to the presence of a turbidity front and other dynamic processes in the estuary. Trace metals such as Co, Ni and Zn are enriched nearly ten times in the fresh water as compared to the estuarine waters. The water composition plotted in the alumino-silicate system indicates that kaolinite, illite, Mg-chlorite and microcline can be expected to be present in the sediments. Mineralogical observations on the suspended matter and sediments agree with this prediction. (Henley - ISWS)

DETERMINATION OF TETRAMETHYLTHIURAM DISULFIDE (TMTD) IN WATER AND AIR BY COLIMETRY, (IN RUSSIAN),
Pervomaisk Chemical Plant (USSR).
G. V. Semukhina.
Gig Sanit. 2, p 74-75, 1975.

USDA - U. of Illinois - Urbana

Descriptors: *Pollutant identification, *Organic compounds, Water analysis, *Sulfides, *Colorimetry, Industrial wastes.
Identifiers: *Tetramethylthiuram disulfide.

To determine tetramethylthiuram disulfide (TMTD) in water it is extracted from water with chloroform, and a 1% alcoholic solution of copper chloride and alcohol are added to the chloroform solution of TMTD obtained in a quantity such that the chloroform/alcohol ratio is 2:3. After the solution obtained is held for 45 min on a water bath at 45-50C, it is analyzed by the colorimetric method. The sensitivity of the method is 0.2 mg/l. For determining the content of TMTD in the air of industrial rooms the dust of the preparation is caught by a filter and dissolved in chloroform. The further determination is conducted as described above. The sensitivity is 0.1 mg/m3.--Copyright 1975, Biological Abstracts, Inc.

MYXOBACTERIA OF THE MYXOCOCCUS GROUP AS INDIRECT INDICATORS OF FECAL MATTER IN SURFACE WATER: 1. COMMUNICATION, (IN GERMAN),
W. Graef.
Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. 160(1), p 28-39, 1975.

Descriptors: *Bioindicators, Bacteria, Surface waters, Myxobacteria, Aerobic bacteria, Europe, Lakes, *Pollutant identification.
Identifiers: Austria, Fecal matter, Germany, *Myxococcus, Regnitz River, Switzerland, *Lake Constance(Germany), *Membrane-filter method.

The fruiting-body-forming myxobacteria of the Myxococcus group are coprophilic, i.e., they accumulate in biotopes containing fecal substances. A detection method of Myxococcus in water, based on the membrane-filter method, was developed. Field studies in the region of a mechanico-biological clarifying plant, above a stretch of the Regnitz River laden with waste-water, and on the Bodensee (Lake Constance) (West Germany) revealed a clear correlation between the load of fecal substances in such waters and their content of myxococci. These germs can be used as indirect bacterial indicators of fecal substances.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Bioassay, *Methodology, *Analytical techniques, Fresh water fish, *Toxicity, Invertebrates, Oil, Phenols, Ammonia, Chromium, Snails, *Daphnia, *Pollutant identification, Bioindicators, *Oil wastes, Oil pollution, Water pollution effects.
Identifiers: *Daphnia pulex, Daphnia magna, Oil refinery wastes.

A simple method is suggested for on-site toxicity testing of refinery effluents. An arbitrary reference mixture, containing six common constituents of refinery wastewaters, was used for static toxicity tests on 15 species of freshwater invertebrates and 3 species of fish. Daphnia pulex was selected for further testing because it was the most sensitive of the animals tested, relatively inexpensive and easy to maintain, and a potential fish-food organism. The Daphnia bioassay would be sufficiently sensitive to give reliable results within 48 h, whereas a fish bioassay would show no toxicity even after 96 h. To assess the suitability of the Daphnia bioassay, tests were conducted by personnel at six petroleum refineries. Results of tests using actual refinery effluents ranged from no toxicity after 96 h to a mean lethal concentration of 1.2% effluent after 48 h. (Katz)

APPLICATION OF REAL-TIME MASS SPECTROMETRIC TECHNIQUES TO ENVIRONMENTAL ORGANIC GEOCHEMISTRY. I. COMPUTERIZED HIGH RESOLUTION MASS SPECTROMETRY AND GAS CHROMATOGRAPHY-LOW RESOLUTION MASS SPECTROMETRY,
California Univ., Berkeley. Space Sciences Lab.
B. R. Simoneit, D. H. Smith, and G. Eglinton.
Archives of Environmental Contamination and Toxicology, Vol. 3, No. 4, p 385-409, 1976. 5 fig, 1 tab, 41 ref.

Descriptors: *Organic compounds, *Pollutant identification, *Spectrometry, Computers, Sewage treatment, *Gas chromatography, Carbon, Hydrogen, Chlorine, Data collections, *Analytical techniques, *Mass spectroscopy, Methodology.

A mass spectrometer/computer system (LOGOS) was used to study organic compounds in the environment. A water-borne particulate sample, an air particulate sample from Bristol, England; filtered water samples from San Francisco Bay; and a sewage sludge sample were examined. The mass spectrum for the water-borne particulate sample consisted predominantly of hydrocarbon ions of relatively high degrees of unsaturation. The air particulate sample contained a more diverse and complex mixture. Species containing between one and four oxygen atoms made important contributions to the mixture. Solvent soluble extracts of water from the San Francisco Bay consisted predominantly of a variety of complex hydrocarbon mixtures. The relative amounts of the various hydrocarbon structural types varied widely. The major compound investigated in sewage sludge was bis(p-chlorophenyl)acetonitrile(p,p'-DDCN). The LOGOS system normally calculates composition according to numbers of carbon, hydrogen, and chlorine atoms within a specified range; but, to investigate a specific compound, another atom,

this case nitrogen, can be added and the maximum empirical formula specified only slightly larger than the empirical formula of the compound of interest. The mass spectrometer/computer system was very satisfactory for preliminary data characterization. (Snyder-FIRL)

ORGANIC CONTAMINANTS OF WATER,
Dow Chemical U. S. A., Midland, Mich. Waste Control Div.
C. E. Hamilton.
ASTM Standardization News, Vol. 4, No. 1, p 34-35, 49, January, 1976.

Descriptors: *Analytical techniques, *Pollutant identification, *Organic compounds, Biochemical oxygen demand, Chemical oxygen demand, Activated carbon, Gas chromatography, Water analysis.

Organic matter of either human or natural origin causes problems in drinking water and industrial water. Little is generally known about the specific organic compounds in a water waste stream; many possible products of reactions among the contaminants may never have been isolated or identified. Little effort is made to define the constitutents precisely except when adverse effects on humans or the environment are suspected. Sensory perception, by sight or smell, of organic pollution, although subjective, is widely available, inexpensive, and very sensitive to certain types of contamination. Smell has not been widely used due to the variation in individual response to the same stimuli. Photometers and colorimeters can be used to improve upon visual observation. Invisible portions of the spectrum can also be used. Biochemical oxygen demand (BOD) measures the oxygen required to stabilize biodegradable material, but can only be compared among similarly tested samples. Chemical oxygen demand (COD) does not measure organics specifically, because some inorganics also reduce the chemical oxidant. The organic concentration can be determined from the results of a form of total carbon analysis. The total oxygen demand measures the ultimate oxygen required to stabilize the contaminants, but may not accurately indicate organic content because some inorganics consume oxygen and some substances release oxygen. Solvent extraction and activated carbon absorption determine total organic contaminants, but variable extraction efficiencies, loss of volatile organics, and water and organic salts accumulation must be considered. Use of gas chromatography to analyze organic water contaminants has begun and will probably increase. (Snyder-FIRL)

EVALUATION OF COMBINED APPLICATIONS OF ULTRAFILTRATION AND COMPLEXATION CAPACITY TECHNIQUES TO NATURAL WATERS,
Skidaway Inst. of Oceanography, Savannah, Ga.
R. G. Smith, Jr.
Analytical Chemistry, Vol. 48, No. 1, p 74-76, January, 1976. 1 fig, 2 tab, 11 ref.

Descriptors: *Membrane processes, *Organic compounds, Rivers, *Pollutant identification, Carbon, Analytical techniques, Distribution, Dissolved solids, *Georgia, Estuaries, Path of pollutants, Copper, Salinity, Volumetric analysis, Filtration.
Identifiers: *Ultrafiltration, *Anodic stripping voltametry, Complexing materials, Organic carbon.

The application of a combination of ultrafiltration, membrane fractionation, and anodic stripping voltammetry to studying the distribution of complexing materials in natural waters was evaluated. Each sample was separated into several fractions, and the complexation capacity of each fraction for copper was determined. Between 80 and 90% of the total dissolved organic carbon was recovered after fractionation with a plus or minus 4% coefficient of variation. Precision of plus or minus 8% was obtained. The technique was applied to samples from five stations in a Georgia estuary. The apparent ability of low molecular weight fractions to complex copper increased with increasing salinity. This method should be useful in studying the mechanisms of trace metal interaction with organics in river systems. (Snyder-FIRL)

TURBIDIMETER LIGHTS THE WAY TO ACCURATE PROCESS CONTROL,
Process Engineering, p 87-88, February, 1976. 4 fig.

Descriptors: *Analytical techniques, *Turbidity, *Photometry, *Pollutant identification, Equipment, Control, Performance, Operations.
Identifiers: *Process control, *Turbidimeters, Photocells.

In the late 1960's only a few process photometers were available, most of which depended on effects such as extinction/absorption or scattering. Disadvantages of these meters included the need for large dilutions; the need for frequent cleaning, calibration, and maintenance; and sensitivity to color changes. A four beam alternating light photometer was subsequently developed, with a probe which can be submerged in the material being measured. It was designed to be sufficiently accurate for process control. The probe has two lamps, which can be lit alternately, and two photocells, with the fluid to be measured between the lamps and photocells. The extinction module of the fluid is determined from the current from the two photocells using one lamp at a time. Because the equations used eliminate the photocell currents and photo-electric constants, the measurements are independent of lamp intensity or dirt on the lamps or photocells. (Snyder-FIRL)

STEROIDS IN EFFLUENTS,
Clyde River Purification Board, Glasgow(Scotland).
J. P. Dawson, and G. A. Best.
Proceedings of the Analytical Division, Chemical Society, p 311-315, December, 1975. 1 fig, 4 tab, 4 ref.

Descriptors: *Tracers, *Coliforms, *Pollutant identification, Sewage treatment, Water pollution, Bacteria, Effluents, Waste water treatment, Bioindicators, Path of pollutants.
Identifiers: *Fecal contamination, *Coprostanol, *Steroids.

The use of coprostanol, a steroid, was investigated as an internal tracer for fecal contamination in water. The method was first tested on spiked samples; steroid concentrations were then determined at various stages of treatment in sewage works, upstream and downstream from an effluent discharge, near a large sewage works discharging settled sludge into an estuary, near a small outfall discharging macerated sewage, and at various remote areas on the West coast of Scotland. The reduction of coprostanol due to sewage treatment was similar to that of conventional water pollution parameters. The coprostanol concentration gradually decreased with distance downstream from the effluent discharge, but the cholesterol concetration showed no such trend, probably because cholesterol from farm drainage had entered the stream above the discharge. Tests in the estuary also showed the advantate of coprostanol over cholesterol as a tracer. Coliform counts were more variable than steroid analysis; steroids were rapidly diluted in the estuary, and steroids and coliforms were found in surface water over 20 km from the discharge. It was difficult to compare results from coprostanol, cholesterol, and coliform measurements near the small outfall, due to the variability of results. Results from both fresh and saline water indicated coprostanol to be a good indicator of fecal pollution. Coprostanol analysis requires more time than bacteria counting, but analysis does not need to be done immediately, and the results obtained are less subject to error. (Snyder-FIRL)

TRACE-ELEMENT ANALYSIS USING X-RAY EMISSION SPECTROSCOPY,
Institut., Rudjer Boskovic, Zagreb (Yugoslavia).
D. Rendic, S. Blagus, V. Pecar, and V. Valkovic.
Fizika, Vol. 7, p 112-115, 1975. 2 fig, 3 ref.

Descriptors: *X-ray spectroscopy, *Analytical techniques, *Pollutant identification, *Trace elements, Water pollution, Environmental effects, Metals, *X-ray analysis, Computer programs, *Spectroscopy.

The basic process in X-ray spectroscopy consists of exciting a sample with incoming photons or charged particles and detecting the X-rays emitted. It is used to analyze trace elements. Its many fields of application include the study of water pollution. Its advantages include simultaneous determination of all medium-heavy and heavy metals, simple sample preparation and the ability to use small sample quantities, high accuracy, and the ability to detect concentrations as small as one in 1,000,000. An X-ray spectroscopy system has been developed which includes a computer program for automatic analysis of X-ray spectra and determining absolute elemental concentrations. This system is widely used in studying environmental samples. A similar system is being built at the Rudjer Boskovic Institute based on experience with the first system. The development of similar computer programs for analyzing X-ray spectra is included. According to preliminary results, the

Library U. of F. Graham Area

method has numerous capabilities and advantages for analyzing elements in low concentrations. Using an X-ray source of around 1000 watts would establish X-ray emission spectroscopy as a powerful new technique with applications in fundamental research as well as environmental pollution. (Snyder-FIRL)
W76-09697

DISTRIBUTION OF BDELLOVIBRIO BACTERIOVORUS IN SEWAGE WORKS, RIVER WATER, AND SEDIMENTS,
University of Wales Inst. of Science and Technology, Cardiff. Dept. of Applied Biology.
J. C. Fry, and D. G. Staples.
Applied and Environmental Microbiology, Vol. 30, No. 4, p 469-474, April, 1976. 4 fig, 3 tab, 20 ref.

Descriptors: *Pollutant identification, *Bacteria, Rivers, *Sewage, Aerobic conditions, Anaerobic conditions, Sewage treatment, Effluents, Distribution, *Path of pollutants, Water pollution.
Identifiers: *Bdellovibrio bacteriovirus.

The source and extent of Bdellovibrio, a bacterial predator, in British rivers were studied, along with the possibility that it could grow or control bacterial populations in river sediments or sewage. Bacteria from samples of river water, liquid sewage, final settlement sludge, and river sediment were cultured, and plaques were counted and examined microscopically. Bdellovibrio occurred in all liquid sewage examined. It also occurred in all river sediments and polluted river waters examined, although it was not found in some of the unpolluted river waters. The predator could multiply on the large numbers of bacteria in aerobic percolating filter films, but not in anaerobic sludge. It occurred in river sediments' aerobic surface layers, but not in anaerobic bottom layers. Sewage works effluents were the major Bdellovibrio source in polluted rivers examined, and numbers in sediment and river water were correlated with the quality of the river water. Bdellovibrio was probably not important in controlling other bacteria either in sewage or in river sediment. (Snyder-FIRL)

LABORATORY EVALUATION OF THE COULTER ON-LINE PARTICLE MONITOR,
Welsh School of Pharmacy, Cardiff.
M. I. Barnett, E. Sims, and R. W. Lines.
Powder Technology, Vol. 14, No. 1, p 125-130, May-June, 1976. 2 fig, 3 tab, 7 ref.

Descriptors: *Measurement, *Laboratory tests, *Monitoring, Microorganisms, Flocculation, Oceans, Control, *Pollutant identification, Water pollution effects, Microbiology.
Identifiers: Coulter on-line particle monitor.

The Coulter On-Line Particle monitor, which counts particles within specified size intervals for control purposes or continuous monitoring, was evaluated in the laboratory. The monitoring applications studied include filtered electrolyte, intravenous fluids, sea and river water, and microbial growth. Instrumental noise and external interference caused a minor problem, giving a lower limit of about 3% of aperture diameter instead of the normal 2%. When used with the proper Coulter Counter, it has direct application to studying microbiological growth and flocculation. The monitor also has obvious applications to the study of particulate contamination. Sea water and river water were successfully monitored using 100 micron aperture tubes, although the low conductivity of the river water gave rise to some noise generation below 4 to 5% of the aperture diameter. REPRESENTATIVE DIRTY WATER SAMPLING,
R. Jenkins.
Effluent and Water Treatment Journal, Vol. 16, No. 3, p 144-145, March, 1976. 2 fig, 3 ref.

Descriptors: *Sampling, *Suspended solids, *Effluents, *Pollutant identification, Municipal wastes, Industrial wastes, *Monitoring.

Effluent sampling is required to determine the composition of liquids with suspended solids, but the sampling method itself may change the fall-out rate in its vicinity, leading to errors. Many samples are needed due to the varying composition of the fluid, and sampling rate should be proportional to flow, because many processes have periods of high flow rate and low contamination, and low flow rate and high contamination. The simplest continuous automatic sampler is the air displacement sampler, which is immersed in the fluid so that hydrostatic pressure pushes the sample into the sampling chamber. If the inlet is placed at 20% of 'full bore', the rate of sampling against flow rate approximates the characteristic of the pipe or channel. The average absolute error between 10 and 100% of full flow is under 1% for pipes and 2% for channels. The design of this type of sampler ensures that samples are 'representative' due to the design inlet and absence of a pump, and mathematically representative due to the rate of sampling being nearly proportional to flow rate. (Snyder-FIRL)

POLLUTION INFLUENCE ON THE INFUSORIAL FAUNA (PROTOZOA, CILIATA) OF BULGARIAN RIVERS II. THE OGOSTA RIVER AND ITS EFFLUENTS,
R. Detcheva.
Khidrobiologiia, No. 2, p 19-31, June, 1975. 1 fig, 3 tab, 4 ref.

Descriptors: *Pollutant identification, *Microorganisms, *Rivers, Water pollution effects, Biochemical oxygen demand, Ammonia, Dissolved oxygen, *Protozoa, Effluents.
Identifiers: *Bulgaria(Ogosta River).

Species of ciliates were investigated in 56 samples from 14 locations along the Ogosta River, Bulgaria, and its tributaries from spring to autumn 1969. The seasonal influence and the influence of river pollution on the species of ciliates present was studied. Fifteen hydrochemical indices giving some indications as to the saprobiological conditions in the river, compared with previous values. The data exactly coincided for several species. Some deviations occurred in the values of dissolved oxygen, ammonia, and biochemical oxygen demand (BOD). (Snyder-FIRL)

CONCENTRATION OF HEAVY METALS IN SEDIMENTS OF A HYDROELECTRIC IMPOUNDMENT,
Montana Univ., Missoula, Dept. of Zoology.
A. K. Bailey, and G. F. Weisel.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-254 549, $4.50 in paper copy, $2.25 in microfiche. Research Report No. 75, Montana University Joint Water Resources Research Center, Bozeman, March 1976. 66 p, 10 fig, 7 tab, 32 ref. OWRT A-086-MONT(1).

Descriptors: Water quality, *Heavy metals, *Sediments, Settling basins, *Mine wastes, *Lake sediments, Iron, Zinc, Copper, Manganese, *Pollutant identification, Impoundments, Hydroelectric plants, *Montana, Invertebrates, Oligochaetes, Diptera.
Identifiers: Milltown Dam(Mont), Clark Fork River(Mont), Metal concentration, Blackfoot River(Mont).

Milltown Dam, located near Bonner, Montana, has acted as a settling basin for 69 years for waste in the Clark Fork River originating from the Butte mines and Anaconda Copper Mining Company smelter 95 miles upstream. This study undertook the determination of the amounts of heavy metals accumulated in the sediments of Milltown reservoir. Sediments in the Blackfoot River portion of the reservoir were used for comparison with the Clark Fork River sediments. Sediment cores from the Clark Fork River had high levels of Cu, Zn, and Mn compared to sediments reported in other studies and to a core taken from the Blackfoot River. Peaks of high Cu, Zn, Mn, and Fe concentrations were found at the same depth within most of the Clark Fork cores. Cu concentration ranged in these cores from 50-7,900 microgram/gm; Zn ranged from 300-7,900 microgram/gm; Mn ranged from 350-2,900 microgram/gm; Fe ranged from 10,500-43,300 microgram/gm. The peaks of metal concentration were concluded to be caused by changes in operations, smelter shutdowns, and spills from settling ponds near Anaconda. Macroinvertebrates in sediment samples were predominately oligochaetes and one species of dipteran (Chironomus (Chironomus) sp.). There was no statistically significant difference between the numbers and kinds of macroinvertebrates at the mouth of the Blackfoot River and the Clark Fork impoundment.

MATERIALS BUDGETS OF LAKE CHAMPLAIN,
Vermont Univ., Burlington. Dept. of Zoology.
E. B. Henson, and M. Potash.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-254 562, $4.50 in paper copy, $2.25 in microfiche. Vermont Water Resources Research Center, Burlington. Completion Report, January 1976. 62 p, 6 fig, 1 tab, 16 ref. OWRT A-014-VT(2).

Descriptors: Dissolved solids, Phosphates, Conductivity, Eutrophication, Lakes, *Nutrients, Water quality, *Recycling, *Vermont, *Cycling nutrients, Tributaries, Estimating, *Pollutant identification, Cations, Alkalinity.
Identifiers: *Lake Champlain.

Objectives were to ascertain the general water quality status of the tributaries discharging into Lake Champlain and to estimate the material input to the lake. Water samples were collected from about 40 tributaries during the period 1970-1974. The water samples were analyzed for the major cations (Ca++, Mg++, Na+, and K+), total and reactive phosphate, conductivity, alkalinity, and pH. In addition, analyses for dissolved oxygen, BOD, and suspended material were sometimes made. Total dissolved solids into Lake Champlain amounted to 888,429 tons annually (713 gms/sq. meter). Total phosphorous from the tributary streams ranged between 200 to more than 400,000 lbs/yr. It was estimated that more than 50% of the total phosphorous being added to the lake was retained in the lake, 21% of the sodium, 13% of the magnesium, and 3% of the dissolved solids. Ten years of data collected from the main lake reference stations were summarized.

MARINE SOIL POLLUTION AND SELF-PURIFICATION, (IN RUSSIAN),
Institute of Biology of the Southern Seas, Sevastopol (USSR).
L. N. Kiryukhina, M. I. Kucherenko, and O. G. Mironov.
Gidrobiol Zh. 10(2), p 55-59, 1974.

Descriptors: *Microorganisms, Marine animals, *Bottom sediments, *Bays, Bottom sampling, *Self-purification, Water analysis, *Pollutant identification.
Identifiers: *Carbohydrate oxidizing microorganisms.

A detailed analysis is given of the physicochemical composition of the bottom sediments, distribution of chemical components with depth and the species composition, density and regularity of occurrence of carbohydrate oxidating microorganisms. The data show weak self-purification processes in the bottom sediments of the bay.--Copyright 1975, Biological Abstracts, Inc.

PRESENCE AND SOME PROPERTIES OF BACTERIA OF THE FAMILY PSEUDOMONADACEAE IN THE RIVER DANUBE, (IN GERMAN),
Slovenska Akademie Vied, Bratislava Czechoslovakia). Limnobiologisches Institut.
B. Trzilova.
Biologia (Bratisl) 29(9), p 681-690, 1974.

Descriptors: *Bacteria, *Pseudomonas, *Distribution, Rivers, Europe, Temperature, Aeration, *Enteric bacteria, *Chromatography, *Pollutant identification.
Identifiers: *Aeromonas, Aeromonas-Hydrophila, Aeromonas-Punctata, Aeromonas-Salmonicida, Chromatography, Czechoslovakia, Danube, Pseudomonas-Fragi, Pseudomonas-Putida, Pseudomonas-Stutzeri, *River Danube.

The numbers, species distribution and antagonistic activity of bacteria of the family Pseudomonadaceae from 1 profile in the middle of the river Danube (Czechoslovakia) from 1969-1970 are described. The bacteria showed great numbers during winter and spring, the lowest values seen from May until Sept. Isolated species were Pseudomonas fragi, P. putida, P. stutzeri, Aeromonas salmonicida, A. hydrophila and A. punctata. An indirect correlation with temperature was shown in bacteria of the genus Pseudomonas anda direct one in bacteria of the Aeromonas. From 102 isolated strains of the family Pseudomonadaceae some 69 inhibited the growth of bacteria of the family Enterobacteriacae. With water aeration of values to 1.01/min the elimination of Enterobacteriaceae is speeded up. By use of chromatography it was shown that strains of the genus Aeromonas and Pseudomonas produced efficient substances which are moderately hydrophilic in character and are spectrally related.--Copyright 1975, Biological Abstracts, Inc.

SANITARY INSPECTION OF SURFACE WATERS POLLUTED WITH AROMATIC AMINO AND NITRO-COMPOUNDS, (IN RUSSIAN),
Leningrad State Medical Inst. of Sanitation and Hygiene.
A. G. Ilichkina, I. I. Bat', and V. V. Kirichenko.
Gig Sanit. 9, p 100-101, 1974.

Descriptors: *Organic compounds, Surface waters, *Aromatic compounds, *Nitrogen compounds, Methodology, *Pollutant identification, Phenols, Amino acids, Oxidation, Metabolism, Oxygen, Water pollution.
Identifiers: Allergens, *Amino compounds, Aniline, Benzene.

Methods are described for quantitative analysis of p-phenetidine, p-nitrophenol, m-trifluoromethylnitrobenzene, which cause degenerative changes in the blood and methemoglobinemia and are delayed-type allergens. When present in small quantities, these aromatic amino- and nitro-compounds can be oxidized biochemically and chemically, but when present in higher quantities, they can be only chemically oxidized; these compounds utilize O2 during metabolic breakdown.--Copyright 1975, Biological Abstracts, Inc.

IRON-MANGANESE MICROORGANISMS STUDIED BY OVERGROWING TECHNIQUE, (IN RUSSIAN),
Akademiya Nauk SSSR, Leningrad. Institute of Lakes Keeping.
R. S. Kutuzova.
Mikrobiologiya. 44(1), p 156-159, 1975.

Descriptors: *Microorganisms, Lakes, *Pollutant identification, Iron, Manganese, *Microscopy, Analytical techniques.
Identifiers: Euglena, Mettalogenium, Trachelomonas-Volvocina, *USSR(Lake Krasnoye), *Iron-manganese microorganisms, Capillary microscopy.

Microorganisms in the surface layer of ooze and in the bottom layer of water in the ore field of Lake Krasnoye were studied by capillary microscopy (USSR). The lake Fe-Mn organisms differ from those in the 2nd ooze profile. Fe-Mn microorganisms were found on Euglena, and the nature of the relationship is discussed. (Metallogenium and Trachelomonas volvocina are also discussed.)--Copyright 1975, Biological Abstracts, Inc.

THE HEAVY METAL CONCENTRATIONS IN THE WATERS ALONG THE COAST OF FUKUYAMA, (IN JAPANESE),
Kagoshima Univ. (Japan). Lab of Marine Botany and Environmental Sciences.
A. Inoue, R. Kaibara, and S. Asakawa.
Mem Fac Fish Kagoshima Univ. 23, p 217-228, 1974.

Descriptors: *Heavy metals, Coasts, *Spectrophotometry, *Pollutant identification, Seasonal, Rainfall, Iron, Manganese, Nickel, Zinc, Cobalt, Copper, Cadmium.
Identifiers: *Japan(Fukuyama), *Atomic absorption spectrophotometry.

The concentrations of heavy metals (Fe, Mn, Co, Cu, Zn, Ni and Cd) in the nearshore waters of Fukuyama (Japan), were determined at monthly intervals by atomic absorption spectrophotometry and their seasonal and geographic variations discussed. The heavy metal concentrations were 0.10-0.15 micro-g/ml, Fe; 0.001-0.030, Mn; 0.02-0.04, Co; 0.009-0.090, Zn; 0.004-0.030, Cu; 0.003-0.030, Ni; and 0.0005-0.003, Cd, respectively. The samples retain normal concentrations of trace elements for coastal waters with the exception of Ni. Seasonal changes of heavy metal concentrations were not detected except for Fe and Mn which increased during and after the rainy season in summer suggesting replenishment from land. No definite difference was found for any metals between the surface and bottom waters. A direct linear relationship was detected between Cu and Zn.--Copyright 1975, Biological Abstracts, Inc.

OSCILLOPOLAROGRAPHIC DETERMINATION OF CYANIDE IN WASTE ELECTROPLATING INDUSTRIAL EFFLUENTS,
Istituto di Chimica Generale e Inorganica Pavia (Italy). Laboratorio Chimica Analitica.
C. Bertoglio Riolo, T. Fulle Soldi, G. Spini, and M. Pesavento.
Ann Chim. 64(5/6); p 425-428, 1974.

Descriptors: Analytical techniques, *Polarographic analysis, Effluents, Wastes, Water pollution sources, *Industrial wastes, *Pollutant identification.
Identifiers: *Cyanide, *Electroplating industry, *Oscillopolarographic technique.

A rapid, easy and reliable oscillopolarographic technique for the determination of cyanide, free and/or complexed, in waste electroplating industrial effluents samples is described. The method provides sensitivity of 0.1 mg/1. The analysis is performed directly on the electroplating waste effluent samples, avoiding chemical pre-treatments and distillation processes. The method takes advantage of the formation of a Cu(I)-cyanide complex obtained by adding suitable quantities of cupric ions to the samples. This compound, in a basis medium, shows an oscillopolarographic peak. Its stability constant is higher than that of other cyanocomplexes of heavy cations (except

LIBRARY U. S. Bureau of Mines

for Fe(II) and Co(III)). This fact allows the determination of cyanide, free or complexed with such cations.--Copyright 1976, Biological Abstracts, Inc.

BALANIDAE AS POLLUTION INDICATORS IN THE BAY OF GUANABARA, (IN PORTUGUESE),
Instituto Oswaldo Cruz, Rio de Janeiro (Brazil).
D. Lacombe, and W. Moneiro.
Rev Bras Biol. 34(4), p 633-644, 1974.

Descriptors: *Pollutant identification, *Bioindicators, Indicators, Analytical techniques, Bays, South America.
Identifiers: *Balanidae, Balanus-Amphitrite-Amphitrite, Balanus-Tintinnabulum, Brazil, Tetraclita-Squamosa-Stallactifera, *Barnacles, *Brazil(Bay of Guanabara).

Certain barnacle species are useful as pollution indicators. Among the different species occurring in the Bay of Guanabara (Brazil) Balanus amphitrite amphitrite is the best pollution indicator. This is the only dominant and widespread species in the bay. Three varieties of B. tintinnabulum were observed in the entrance of the bay and Tetraclita squamosa stallactifera in the Flamengo, Botafogo and surroundings. Only B. a. amphitrite is dominant in the bay; its resists all grades of pollution.--Copyright 1976, Biological Abstracts, Inc.

BIOLOGICAL INDICATORS OF ENVIRONMENTAL QUALITY. A BIBLIOGRAPHY OF ABSTRACTS,
W. A. Thomas, W. H. Wilcox, and G. Goldstein.
Illus. Ann Arbor Science Publishers Inc.: Ann Arbor, Mich., 1973, 254 p. $16.50.

Descriptors: *Bioindicators, *Bibliographies, *Abstracts, Air pollution, Algae, Anions, Bacteria, Birds, Conifers, Environment, Fish, Lichens, Metals, Pesticides, Pollutants, Tobacco.
Identifiers: Moss.

An extensive bibliography is provided on the subject of biological indicators. The selected abstracts emphasize the practical aspects of interpreting the biological manifestations of deteriorated environmental conditions and are organized so that users can focus their attention at any level of biological organization from the molecule to the community. The content begins with a section on cell-free systems, including air pollutants, anions, pesticides, trace metals and water pollutants. A section is then included on cultured cells, followed by a section on tissues and organs, including animal tissue, blood chemistry fish brain enzyme and plant tissue. The next section covers organisms, beginning with air pollutants, including general, halides, nitrogen oxides, oxidants and sulfur oxides. Next, animals are discussed, including aquatic invertebrates, birds, and fish, followed by a section on plants, covering conifers, lichens and moss and tobacco. A section is then included on unicellular organisms covering algae and bacteria, followed by a section on water pollution, both fresh water and marine. Finally, a section is included on communities, discussing biotic indices, diversity indices and saprobic indices. The book ends with an addendum section containing other references by title, followed by a list of periodicals cited.--Copyright 1974, Biological Abstracts, Inc.

AIRBORNE DETECTION AND MAPPING OF OIL SPILLS, GRAND BAHAMAS,
Canada Centre for Remote Sensing, Ottawa (Canada), Data Acquisition Div.
J. N. Devilliers.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-238 841, $3.50 in paper copy, $2.25 in microfiche. Canada Centre for Remote Sensing, Dept. Energy, Mines and Resources Data Report 73-7, September 1973. 11 p, 7 fig.

Descriptors: *Oil pollution, *Oil spills, *Mapping, *Remote sensing, *Pollutant identification, *Aerial photography, *Instrumentation, Aircraft, Environmental effects, Water resources, Resources development, Water pollution effects.
Identifiers: *Outer Continental Shelf, Grand Bahamas, Crude oil, Radiometers, Sensors, Infrared sensors, Television, Laser fluorosensors, Fluorosensors.

An airborne exercise is described employing various sensors to investigate their ability to detect and map Louisiana Crude and Naptha oil spills, both by day and by night. It is shown that photographic, infra-red scanning and low light level T.V. all have some ability to detect Louisiana; only infra-red scanning detected naptha. None of these sensors could identify the anomalies as oil. A laser fluorosensor showed promise in detecting oil at night. Further development will be needed to explore the full potential of such a technique. (Sinha-OEIS)

DEVELOPMENT OF A BOAT AND HELICOPTER DEPLOYABLE OIL SLICK SAMPLER,
Marconsult, Inc., Santa Monica, Calif.
A. A. Allen, and L. E. Fausak.
Available from the National Technical Information Service, Springfield, Va., 22161, as AD-A010 199, $4.50 in paper copy, $2.25 in microfiche. Department of Transportation, U.S. Coast Guard Final Report No. CG-D-99-75, May 1975. 46 p, 6 fig, 8 tab, 2 append. DOT-CG-24,828A.

Descriptors: *Oil pollution, *Oil spills, *Sampling, *Instrumentation, Resources development, Water resources, *Pollutant identification, On-site tests, Testing, Boats.
Identifiers: *Oil samplers, Helicopters, Oil films, Oil slicks.

A device for the sampling of water-born oil films ranging from 10-2mm to 10 mm in thickness has been developed. The prototype device is a modified stainless steel testing sieve, normally used in sediment size analysis, into which is placed a sheet of sorbent material. The sampler is suspended from a cable or chain harness and is dipped into an oil slick; the oil film adheres to the stainless steel sieve screen and is absorbed by the sorbent sheet. After retrieval, the sampler is immediately sealed with a clean lid and bottom pan to prevent contamination of the oil sample, and thereby also becomes its own sample container. The results of a limited testing program indicate that the device will collect in excess of the required 50 ml of oil from fresh, thick films, but that samples of five to ten milliliters are more typical of very thin or weathered oil films. The testing pxrogram was limited in that it did not include the use of a helicopter as a sampling platform, nor were laboratory analyses of the collected samples conducted to confirm the sampler's chemical inertness with respect to various oils and solvents. These two areas will be investigated in subsequent Coast Guard testing. Several suggestions are offered to increase the performance and capability of the sampling device. (Sinha-OEIS)

OIL SPILL AND OIL POLLUTION REPORTS, NOVEMBER 1974 - FEBRUARY 1975,
California Univ., Santa Barbara, Marine Science Inst.
F. A. DeWitt, Jr., and P. Melvin.
Available from National Technical Information Service, Springfield, Va. 22161, as PB-242 542, $9.00 in paper copy, $2.25 in microfiche. Environmental Protection Technology Series, Quarterly Report No. EPA-670/2-75-003, May 1975 260 p, numerous ref.

Descriptors: *Bibliographies, *Oil spills, *Oil pollution, *Pollutant identification, *Monitoring, *Remote sensing, *Water pollution effects, Sampling, Water resources Environmental effects, Water quality control, Water resources, Resources development.
Identifiers: *Outer Continental shelf, *Ecological effects, Environmental impact.

The November 1974 - February 1975 Oil Spill and Oil Pollution Reports is the second quarterly compilation of oil spill events and oil pollution report summaries. Presented in the report are: (a) summaries of oil spill events; (b) summaries and bibliographic literature citations; (c) summaries of current research projects; and (d) patent summaries. The summaries and bibliographic citations of articles presented in Section I are grouped according to subject and are then arranged alphabetically by senior author within each subject division. The sources of the summarized material are scientific, technical, and abstracting journals. Section II lists Current Research Project entries appearing in Report I and includes descriptive project information provided upon request by the principal investigators and/or performing organization. All reports and publications are entered in summary form. Current Research Project summaries are grouped according to subject and then arranged alphabetically by senior principal investigator within each subject division. Patent summaries are divided into United States and foreign subsections and arranged alphabetically by inventor in each section. All patent information was obtained from abstract journals. A subject cross index is provided at the end of the report. (Sinha-OEIS)

lentifiers: *Outer Continental Shelf, *Airborne nsors, Sensors, Television, Surveillance, Real- me.

prototype airborne oil surveillance system was eveloped for the U. S. Coast Guard. The mul- sensor system permits real-time day/night, all- eather detection, mapping and documentation of l spills at sea. The system was installed aboard a oast Guard HU-16 Albatross and flight tested off e California Coast. Surveillance data were ob- ined from natural seeps, a series of controlled oil ills, routine shipping and targets of opportunity. he airborne system consists of a sidelooking dar, a passive microwave imager, a multispectral w light level TV, a multichannel line scanner, a sition reference system, and a real-time proces- or/display console. The system reliably detected nd mapped oil spills and seeps for conditions nging from dense undercast to clear, wind eeds from 0 to 26 knots and daytime to total arkness. Test results demonstrate that airborne il surveillance is practical and the system can be valuable to other Coast Guard missions. (Sinha-EIS)

DETERMINING THE CONCENTRATION OF OIL IN WATER SAMPLES BY INFRARED SPECTROPHOTOMETRY. PHASE II. INTER-LABORATORY STUDY. VOLUME II,
Naval Ship Research and Development Center, nnapolis, Md.
. Finger, H. Feingold, E. Timko, and S. Orbach.
vailable from the National Technical Informa- on Service, Springfield, Va., 22161, as AD-A011 42, $5.00 in paper copy, $2.25 in microfiche. Naval Ship Research and Development Center Re- ort No. NSRDC 4536, January 1975. 88 p, 27 tab, 6 ref.

escriptors: *Oil pollution, *Pollutant identifica- on, *Methodology, *Spectrophotometry, Regres- ion analysis, Laboratory tests, Infrared radiation.
dentifiers: *Infrared spectrophotometry.

n interlaboratory study to validate a method for easuring the concentration of oil in water was onducted with the active participation of seven boratories. The test plan required each laborato- y to analyze either 120 samples (a full factorial) or 0 samples (a half fractional factorial). The results f the interlaboratory study indicate that the IR ethod can be used for the quantitative deter- ination of oil in aqueous solutions. No statisti- ally significant variations with respect to water alinity have been noted. Prediction of individual boratory performance based on the results are ade for concentrations of 10 p/m, 15 p/m and 100 /m; for sample sizes of 1, 2, 3, and 6; at con- idence leves of 80%, 90%, 95% and 98%. A pre- iction based on the combined results of all labora- ories was also made. This prediction is useful as a uide in designing sampling plans and preparing ontract specifications. This report has been is- ued in three (3) volumes. The first contains the ighlights of the results; this, the second gives the etails of the analysis; and the third, the actual ata. W76-09901

SENSORS FOR CONTINUOUS MONITORING OF TOXIC IONS, NUTRIENTS, AND DISSOLVED GASES IN WATER,
North Carolina Univ., Chapel Hill. Dept. of Environmental Sciences and Engineering.
M. S. Shuman, and W. W. Fogleman.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-254 834 $6.00 in paper copy, $2.25 in microfiche. North Carolina Water Resources Research Institute, Raleigh, UNC-WRRI Rpt. No. 113, April 1976. 122 p, 14 fig, 9 tab, 398 ref. OWRT B-074-NC(1), 14-31-0001-4157.

Descriptors: *Electrodes, *Metals, *Monitoring, *Measurement, *Pollution identification, *Waste identification, *Potentiometers, Nutrients, Instrumentations, Cadmium, Copper, Iron, Lead, Mercury, Nickel, Silver, Zinc, Cyanide, Ions.
Identifiers: *Toxic ions.

Ion-selective electrodes and a new type of dissolved gas sensor based on piezoelectric crystals were assessed for use in continuous monitoring of water quality. Relevant stream and effluent water quality standards were reviewed in order to define the constraints on the use of these sensors. The use of sensors in continuous monitoring programs in the United States and other countries was also examined and reviewed. The state-of-the-art of ion-selective electrodes for toxic ions, nutrients and dissolved gases in water was reviewed. A tabular summary of electrode characteristics and an extensive bibliography were compiled. Recommendations for the use of these sensors were made with consideration of the practical problems encountered in continuous monitoring. A dissolved gas sensor for carbon dioxide utilizing a coated piezoelectric crystal was fabricated and evaluated. Didodecylamine and dioctadecylamine were useful coating materials but were also sensitive to water vapor and sulfur dioxide. A probe was designed with the crystal isolated from the aqueous sample by a film of polyvinyl chloride, cast Teflon or by a microporous Teflon filter. (Stewart - North Carolina State)

COAST GUARD'S RESPONSE TO SPILLED OIL,
Coast Guard Reserve, Washington, D.C. Office of Research and Development.
R. W. Ard, Jr.
Environmental Science and Technology, Vol 10, No 3, p 239-242, March 1976. 5 fig.

Descriptors: *Remote sensing, *Oil spills, *Pollution identification, *Water quality control, *Environmental effects, Resources development, Water pollution sources, Monitoring, Detection, Sensors, Oil pollution.
Identifiers: Outer Continental Shelf, *Offshore technology, Airborne sensors, In-situ sensors.

The Coast Guard's Office of Research and Development has an extensive remote sensing program to detect oil spills. This program is broken down into two major categories: in-situ and airborne. In-situ sensors are used to survey the immediate area of the sensor and are typically mounted on bridge piers, buoys, and piles. Airborne remote sensing, or using appropriate sensors on an aircraft, can cover tremendous areas over short periods of time and can map the extent of the spill with appropriate documentation for later legal action. Many in-situ sensor concepts have been investigated by the Coast Guard including those that use vapor detectors, various mechanical schemes, and visible, ultraviolet, and infrared detectors. The Coast Guard Research and Development Center is developing a system that will determine the source of a spill with sufficient confidence that violators can be prosecuted. Every promising technique was evaluated for its ability to characterize oils. The most promising techniques have been infrared and fluorescence spectroscopy, gas chromatography, and thin-layer chromatography. The detection probabilities for each method in ten simulated spills involving 63 samples were: infrared 94.4%; fluorescence 91.1%; gas chromatography 91.1%; and thin-layer chromatography 62.9%, for a combined probability of 99.9%. (Sinha-OEIS)
W76-09915

DEPENDENCE OF THE LEVEL OF NITROGENASE ACTIVITY ON THE WATER CONTENT OF THE THALLUS IN PELTIGERA CANINA, P. EVANSIANA, P. POLYDACTYLA, AND P. PRAETEXTATA,
McMaster Univ., Hamilton (Ontario). Dept. of Biology.
K. A. Kershaw.
Can J Bot. 52(6), p 1423-1427, 1974.

Descriptors: Chromatography, *Pollutant identification, *Nitrogen fixation, Monitoring, *Lichens.
Identifiers: Nitrogenase activity, Peltigera-Canina, Peltigera-Evansiana, Peltigera-Polydactyla, Peltigera-Praetextata, Thallus moisture(Lichens), *Peltigera sp.

The rates of nitrogen fixation and the response to changing levels of thallus moisture have been monitored in P. canina (L.) Willd., P. evansiana Gyel., P. polydactyla (Neck.) Hoffm. and P. praetextata (Somm.) Vain., using standard vapor-phase chromatography. Maximum levels of fixation range from 2.96 nmol of ethylene evolved/h mg dry weight in P. evansiana to 1.31 nmol G2H4/h mg dry weight in P. polydactyla. Each species shows a slightly different pattern of fixation response to changing levels of thallus moisture, and the pattern of fixation correlates with the ecological preferences of each species.--Copyright 1974, Biological Abstracts, Inc.

PESTICIDE AND PCB RESIDUE IN ORGANS OF WILD ANIMALS AS INDICATORS OF ENVIRONMENTAL CONTAMINATION, (IN GERMAN),
Munich Univ. (West Germany). Institut fuer Tierphysiologie.
J. Brueggemann, L. Busch, U. Drescher-Kaden, W. Eisele, and P. Hoppe.
Z Jagdwiss. 20(1), p 70-74, 1974.

Descriptors: *Pesticide residues, *Polychlorinated biphenyls, Indicators, Gas chromatography, *Pollutant identification, Environment, *Wildlife.
Identifiers: Bird, Codfish, Liver.

During the years 1970-1973, 800 samples of organs, adipose tissue and eggs from 26 wild animal species were investigated using gas chromatography with respect to chlorinated pesticides and polychlorinated biphenyls (PCB). The most abundant pesticides were HCB and Lindane + isomers. The pesticide- and PCB-concentrations in liver- and fat tissue of herbivores were about 5 times lower (ppb-values) than in carnivores, where the residues accumulated accordng to the food chain. The highest values gotten from eggs of predatory birds and from codfish liver (ppm-values Tab. 2 and 3; for instance DDE and DDT + isomers).--Copyright 1974, Biological Abstracts, Inc.

A SIMPLE PHYSICOCHEMICAL METHOD OF DETECTING TRACES OF SURFACTANTS IN WATER,
Florence Univ. (Italy). Dept. of Physical Chemistry.
R. Cini, A. Ficalbi, and G. Loglio.
Mikrochim Acta 2, p 203-212, 1974.

Descriptors: *Surfactants, *Pollutant identification, *Physicochemical properties, Water quality, Organic compounds, Trace elements.

A physical-chemical method of detecting traces of surfactants (both natural and synthetic) in water is described. This method is based on the measurement of the surface pressure on water samples containing surfactants with molecular weight higher than 150-200, in concentration lower than 2 ppm. In well-defined conditions, the method can yield also quantitative results. Typical results for dimethyldecylphosphine oxide (DC10PO), dimethyldodecylphosphine oxide (DC12PO), isooctylphenoxypolyethoxyethanol(Triton X-100) and sodium dodecylsulfate are reported. A new parameter is proposed to indicate the quality of water with respect to surfactants.--Copyright 1974, Biological Abstracts, Inc.

TECHNIQUE OF WATER SAMPLING IN SANITARY INVESTIGATIONS OF LARGE BODIES OF WATER, (IN RUSSIAN),
Kazan Inst. of Postgraduate Medicine (USSR).
L. N. Krepkogorskii, and Y. N. Pochkin.
Gig Sanit. 38(7), p 72-75, 1973.

Descriptors: *Sampling, Water pollution, *Pollutant identification, *Water analysis, Chemical analysis, Bottom sampling, *Water sampling.

The described water sampler greatly shortens the time required for taking water samples during sanitary investigations of bodies of water. It takes 2 persons 40-50 min to take 6 samples for complete sanitary-chemical, bacteriological, and special analyses (filling of 42 glass bottles) on a 400-800 m wide river at 3 points (near the left bank, middle, and near the right bank; surface and deep or bottom samples are taken at each point). The design of the water sampler eliminates secondary contamination of the sample for bacteriological investigations.--Copyright 1974, Biological Abstracts, Inc.

GAS-LIQUID CHROMATOGRAPHIC DETERMINATION OF BUTYL ACETATE, BUTANOL AND ACETONE PRESENT TOGETHER IN WASTE WATERS, (IN RUSSIAN),
Kiev Medical Preparatory Plant (USSR).
M. S. Komskii, and M. A. Bogatskii.
Gig Sanit. 38(9), p 70-71, 1973.

Descriptors: *Pollutant identification, Methodology, *Gas chromatography, Organic compounds, Analytical techniques.
Identifiers: Acetates, Acetone, Butanol, Butyl acetate.

A rapid, sensitive gas-liquid chromatographic method was developed for quantitative determination of butyl acetate, butanol and acetone present together in waste waters. The determination of all 3 components takes 15 min. The analysis is performed on a gas chromatograph using flame-ionization detector. The sensitivity of the method is 0.2 micro-g of butyl acetate or butanol and 0.05 micro-g of acetone in the analyzed sample.--Copyright 1974, Biological Abstracts, Inc.

USING A CHN ANALYZER TO REDUCE CARBONATE INTERFERENCE IN PARTICULATE ORGANIC CARBON ANALYSES,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
G. Telek, and N. Marshall.
Mar Biol (Berl). 24(3), p 219-221, 1974.

Descriptors: *Pollutant identification, *Carbonates, Water analysis, Carbon, Nitrogen, Hydrogen, Oxidation.
Identifiers: *Organic carbon, *CHN analyzer.

Using a CHN analyzer at a reduced temperature (720C), the organic carbon of particulates taken from water is oxidized while little dissociation of carbonate occurs. When necessary for increased precision or for samples with a high CaCO3 content, the small interference of carbonate with organic C determinations can be quantified by running representative samples at different oxidation time intervals and interpolating to time zero. By running replicates, one at 720C and one at 1100C, data on organic and inorganic C and on N are obtained with the analyzer.--Copyright 1974, Biological Abstracts, Inc.

5B. Sources Of Pollution

EFFECTS OF STORM DISCHARGES ON RIVER WATER QUALITY,
Water Pollution Research Lab., Stevenage (England).
J. H. N. Garland.
Berichte der Abwassertechnischen Vereinigung e.V., No. 28, p 593-602, 1976. 4 fig, 2 tab, 13 ref.

Descriptors: *Storm runoff, *Water pollution source, Rivers, Sewage treatment, Sewerage, Suspended solids, Weirs.

In 1963 about 37% of the storm overflows in Wales and England were considered unsatisfactory. Pollution problems from storm sewage most frequently appeared where overflow settings were below six times dry-weather flow, usually older industrial urban areas where substantial parts of sewage systems had outlived their original design capacity. Considerable deterioration of water quality in the River Tame resulted from storm overflows and surface drainage. A realistic approach to the problem is that of treating the entire river below the last large Effluent outfall using a series of several settling basins. The effect of storm sewage discharge on a river depends primarily on the discharge's duration and strength and the dilution provided by the river. Its strength depends on dry-weather sewage, time of day, time since the last storm, and the flow. In combined sewerage systems, a flood wave precedes the mixed sewage and may cause spillage of dry-weather sewage. If a long time has elapsed since the last rainfall, storm runoff in the first flush may contain very large amounts of suspended solids which had accumulated on surfaces. Discharge duration depends intensity and duration of the rainfall, how the overflow weir is set, and the drainage system's storage capacity. The overflow weir setting has the greatest effect on the frequency of pollution episodes. Another problem is posed by metals, such as zinc, copper, and lead, contained in dust entering urban rivers with runoff. The River Tame shows two types of polluted conditions: one caused by inadequate treatment of effluents, and the other caused by additional pollutants entering during storms. (Snyder-FIRL)

URBAN DRAINAGE STUDIES,
Environmental Protection Service, Ottawa (Ontario).
T. M. Koplyay.
Water and Pollution Control, Vol. 114, No. 1, p 14-16, January, 1976. 1 fig, 2 tab.

Descriptors: *Urban drainage, *Storm runoff, Water pollution sources, Model studies, Snowmelt, Storm drains, Combined sewers, Drainage systems.
Identifiers: Storm Water Management Model.

New approaches to designing and constructing systems to convey surface waters are being examined, due to increasing land servicing costs. Loss of pervious ground due to land development results in increased storm flow velocities and higher peak flows, causing local flooding. The higher velocities also increase the pollution and sediment loads. The Canada/Ontario urban drainage program was set up to define the stormwater problem in the Canadian Great Lakes region, establish priorities and schedules for studies, and develop a strategy for implementing solutions. A study is being conducted to provide an order of magnitude estimate of pollution loadings from urban runoff. Problem identification efforts also include reviewing existing municipal practices in Ontario. The Storm Water Management Model (SWMM) ofthe United States Environmental Protection Agency is being adapted to Canadian conditions. Several data collection projects provide site calibration data, and a sub-routine dealing with snowmelt phenomena is being added. Problems with storm sewers and combined sewers in the United States and Europe were studied. Efforts are being made to ascertain that foreign technical practices will be assessed in terms of their applicability in Canada. An ideal model for regulatory practices will be developed. (Snyder-FIRL)

ENVIRONMENTAL POLLUTION BY CADMIUM AND ZINC DISCHARGED FROM A BRAUN TUBE FACTORY, (IN JAPANESE)
Ibaraki Univ., Mito (Japan). Faculty of Agriculture.
T. Asami.
Sci Rep Fac Agric Ibaraki Univ. 22, p 19-24, 1974.

Descriptors: *Cadmium, *Zinc, Water pollution sources, Waste water(Pollution), *Industrial wastes, Effluents, Sediments.
Identifiers: Soil pollution, Braun tube factory wastes, *Japan.

Cd and Zn discharges from a braun tube factory at Funabashi city, Chiba Prefecture, Japan, were investigated. Sediment of one wastewater outlet contained 9770 ppm Cd and 37,500 ppm of Zn; that of the other contained 4820 ppm Cd and 15,500 ppm Zn. Slag from settling tank thrown on a roadside near an outlet contained 45,500 ppm Cd and 70,000 ppm Zn. The soil even 4 m under the road surface contained 186 ppm Cd and 662 ppm Zn. Sediments in the irrigation canal polluted by the factory waste water contained much Cd and Zn; paddy soils near the canal were polluted by the metals. Houses near the factory were polluted by Cd carried by dust from the slag thrown on the roadside. Surface soil of a yard contained 9.8 ppm Cd. Dust from the nearest house contained 76.5 ppm Cd; the amount of Cd in the dust decreased gradually in proportion to distance from the factory.--Copyright 1976, Biological Abstracts, Inc.

The finite element method based on a Galerkin technique was used to formulate the problem of simulating the two-dimensional transient movement of conservative or nonconservative wastes in a steady state saturated groundwater flow system. The convection-dispersion equation was solved in two ways: in the conventional Cartesian coordinate system and in a transformed coordinate system equivalent to the orthogonal curvilinear coordinate system of streamlines and normals to those lines. The two formulations produced identical results. A sensitivity analysis on the dispersion parameter 'dispersivity' was performed, establishing its importance in convection-dispersion problems. Examples involving the movement of nonconservative contaminants described by distribution coefficients and examples with variable input concentration were also given. The model can be applied to environmental problems related to groundwater contamination from waste disposal sites. (Sims - ISWS)

A general expression for the spatial and temporal distribution of conservative dissolved solids in freshwater rivers which incorporates the contribution of both the groundwater and surface water components of river flow was presented. The first part of this paper deals with the steady state conditions. With certain simplifying assumptions the correlation between concentration of dissolved solids and flow was developed for both spatially uniform and nonuniform conditions. The analysis includes the effect of both geophysical discontinuities and point sources. Examples from a number of rivers throughout the country were presented to indicate the utility of the analysis. The second part addresses the temporal variation of the dissolved solids concentration for two time scales. One described the annual variation in concentration due to the time variable components of the river flow, and the second the variation over a semimonthly period due to a time variable point input. Applications to a variety of river conditions were also presented for the time variable analysis. (Henley-ISWS)

Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 102, No. EE2, Proceedings Paper 12037, p 465-474, April 1976. 5 fig, 2 tab, 10 ref, 3 append.

Descriptors: *Dispersion, *Water pollution sources, *Velocity, *Hydraulics, Environmental engineering, Open channel flow, Rivers, Theoretical analysis, Cross-sections, Mixing, Mathematical models, *Path of pollutants, *Missouri River.
Identifiers: Transverse mixing coefficient.

The coefficient of longitudinal dispersion is an important parameter which characterizes the ability of a stream to reduce the concentration of pollutants along the channels. Field determination of this dispersion coefficient is very time consuming and costly. Using the Fischer formula for variation in the velocity distribution in the transverse direction, an analytical expression was obtained for the dispersion coefficient in terms of a dimensionless parameter, transverse mixing coefficient, shear velocity and average flow velocity, and top width of channel and area of flow cross section. An expression for the dimensionless parameter for an idealized tetragonal cross section was derived. The estimate for the dispersion coefficient for a reach of the Missouri River by the proposed method was shown to be in fair agreement with the observed value. (Singh-ISWS)

Identifiers: *Nitrogen contamination, Methemoglobinemia.

Increased quantities of nitrogen are being released into the soil system. Consequently, higher concentrations of nitrogeneous compounds are making their way into subsoil regions. Knowledge of the behavior and fate of nitrogeneous chemical species in the subsurface environment is needed by those concerned with the prevention and control of ground-water pollution. Any nitrogen compound can be leached if the proper conditions exist. Compounds of nitrogen can move through pore spaces of soil as gases or as solutes in an aqueous solution. Nitrification and denitrification reactions occur in the soil system and are dependent on factors such as soil texture, moisture, temperature and pH. Nitrogen contamination of ground-water supplies is due to agricultural fertilizers, animal wastes, domestic wastes and natural sources. A potential health hazard does exist from the ingestion of nitrate in water supplies. The most apparent danger is to infants less than six months of age, but the nitrate ion could cause methemoglobinemia in adults if it is present in sufficient concentrations. (Heiss-NWWA)

Nebraska Water Survey Paper Number 38, January 1975. 95 p, 17 fig, 2 tab, 60 ref, 5 append.

Descriptors: Water pollution, *Groundwater, *Farm wastes, *Sewage effluents, *Fertilizers, Phosphates, Nitrates, Nitrogen, Chlorides, Sulfates, *Land use, Subhumid climates, Evaporation, Irrigation, Evapotranspiration, Water table, Recharge, Infiltration, Groundwater movement, Wells, Water levels, Sampling, Specific conductivity, Leaching, Septic tanks, Hydrogen ion concentration, Seepage, *Nebraska.
Identifiers: *Ogallala formation(Neb), Soil maps, Nitrogen balance, *Platte River seepage(Neb).

Zones of differing groundwater quality have been delineated in Hall County. Concentrations of sulfates ranged from about 250 mg/l beneath the Platte River bottomlands to greater than 500 mg/l in a broad terrace north of the river. Sulfates in the bottomlands were attributed to infiltration of river water which has concentrations of about 250 mg/l sulfates. High sulfate concentrations beneath the terrace are attributed to leaching of water, accelerated by infiltrating irrigation water, through layers of gypsum in the overlying soils. Nitrate concentrations are variable. Contribution of nitrates from anhydrous ammonia fertilizer application was related to soil types. Leachate from manure accumulations and from septic tanks accounts for some locally high concentrations of nitrate. Seepage from the Platte River has a diluting effect on the nitrate influx to bottomland groundwater. There is a tendency for nitrate concentrations to increase with time. (Schicht-ISWS)

USE OF THE COMPUTER PROGRAM 'STORM' FOR ANALYSIS OF THE QUANTITY AND QUALITY OF URBAN STORM WATER RUNOFF,
Hydrologic Engineering Center. Davis, Calif.
A. D. Feldman, and J. W. Abbott.
In: National Symposium on Urban Rainfall and Runoff and Sediment Control; Proceedings of symposium held July 29-31, 1974, Lexington, Kentucky. Report UKY BU106, p 125-134, October 1974. 3 fig, 2 tab, 9 ref.

Descriptors: *Model studies, *Urban runoff, *Water quality, *Flow, Storm runoff, Overflow, Treatment, Computer programs, Mathematical models, Runoff, Rainfall, Storage, Discharge(Water), Pollutants, Water pollution, Cities, Urban hydrology.

The quantity and quality of urban storm water runoff can be analyzed on a continuous (hourly) basis by the computer program STORM, to aid in the selection of the storage capacities and treatment rates required to achieve desired control of urban storm water runoff. The model considers the interaction of eight storm water elements: precipitation, snowfall and snowmelt, runoff, land surface erosion, pollutant accumulation, storage capacity, treatment rate, and overflows from the storage/treatment system. In this approach, dust and dirt and the associated pollutants are washed from the watershed into gutters and storm sewers. The resulting storm water runoff is diverted (for treatment) at rates not exceeding the specified treatment rate. Runoff in excess of the treatment rate is diverted into storage for subsequent treatment. Runoff in excess of both the treatment rate and storage capacity (overflow) is diverted directly into receiving waters. The quantity and quality of this untreated water (for each combination of storage capacity and treatment rate) is assessed. The quantity and quality of overflows from the storage/treatment facility were assessed for an urban watershed near Oakland, California. (See also W76-09729) (Sims - ISWS)

Available from the National Technical Information Service, Springfield, Va 22161, as PB-254 545, $4.50 in paper copy, $2.25 in microfiche. Technical Report Series H-W, Publication No. 26, February 1976. 44 p, 7 fig, 5 tab, 45 ref, append. OWRT A-063-NEV(1) 14-31-0001-5028.

Descriptors: *Nitrates, Nitrogen, Organic Soils, *Aquifers, *Groundwater mining, Hydrogeology, *Nevada, Arid lands, Water wells, Water pollution sources, Fertilizers, *Geochemistry.
Identifiers: *Las Vegas Valley(Nev).

The problem of high nitrate concentration in shallow ground water in the Las Vegas Valley, Nevada, first became apparent in 1972 when Health Department officials reported nitrate concentrations of up to 449 mg/litre in domestic wells of the area. Possible sources for these high nitrate levels include nitrogen fertilizer, septic system leachates, animal corral leachates, and buried natural organic materials. An initial study was made of the geolo

gy, hydrology, and ground-water geochemistry of the area to characterize potential nitrogen sources of ground-water contamination. High nitrate concentrations in the ground water are between first water and approximately 61 m, though exact thickness of this zone is unknown. There is no evidence to date to indicate nitrate contamination of lower aquifer zones. Natural nitrate producing sources have not been ruled out or proven as the source of the nitrate pollution in the area. All new wells in the area should be drilled to a depth of at least 137 m and sealed for at least the first 61 m. Old wells, as they are phased out, should be properly sealed to minimize opportunity for leakage between aquifer zones. (Fallon-Nevada)

SEDIMENT PROPERTIES, LAKE CHAMPLAIN: 1971-1975,
Vermont Univ., Burlington. Dept. of Geology.
A. S. Hunt.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-254 546, $5.00 in paper copy, $2.25 in microfiche. Vermont Water Resources Research Center, Burlington, Completion Report, August 1975. 85 p, 7 fig, 7 tab, 16 ref. OWRT A-015-VT(1) 14-31-1-5046.

Descriptors: Cobalt, Copper, Zinc, Iron, Manganese, Lead, Titanium, *Lake sediments, Sediments, *Trace elements, Lakes, *Vermont, Industrial wastes, *Pollutant identification, Distribution, *Path of pollutants, Chromium, Nickel.
Identifiers: *Lake Champlain.

Analysis of the minor elements iron, manganese, and titanium, and the trace elements chromium, cobalt, copper, nickel, zinc, and lead has provided information on the distribution and concentration of these substances in the sediments of Lake Champlain. All trace elements concentrations were similar to those of Southern Lake Michigan except cobalt which was considerably higher. Lake Champlain was found to have relatively high surface values for chromium and nickel in the Ticonderoga area and Malletts Bay which have been attributable to industrial pollution. Surface sediment enrichment was found to occur with lead, zinc, and, to a lesser degree, copper throughout much of the Lake. Although the evidence is not conclusive it is most probable that the sediments have derived their characteristics primarily from transport of particulate material into the basin rather than from adsorption from overlying water or upward migration within the sediment column.

CALCULATION OF WATER TEMPERATURES IN CLEAR LAKE, IOWA,
Ichthyol. Assoc., Berwick, Pa. Icthyological Associates, Inc., Berwick, Pa.
T. V. Jacobsen, and R. W. Bachmann.
Iowa State J Res. 48(4), p 285-290, 1974.

Descriptors: *Water temperature, Lakes, *Iowa, *Regression analysis, Treatment facilities, *Air temperature, New York, Indiana, Equations.
Identifiers: *Clear Lake(Iowa).

A 16-yr series of daily water temperature readings from the Clear Lake Water Treatment Plant was used to develop a regression equation for the calculation of lake water temperatures during the ice-free portion of the year. Daily maximum and minimum air temperatures from a local observation station were used as the independent variables. The relationship that gave the minimum standard deviation from regression was Y equal 1.40 plus 0.980 X, where Y is the estimated water temperature (C) on a given day and X is the average of the maximum plus minimum daily air temperatures (C) on that day and the previous 9 days. Daily water temperatures can be calculated with a standard deviation of 1.84 C by use of the equation. Similar relationships were developed for Oneida Lake, New York, Lake Maxinkuckee, Indiana, and Big Spirit Lake.--Copyright 1974, Biological Abstracts, Inc.

Identifiers: Anaerobes, Manganate, *Piggery wastes, Spores, Staphylococcus.

A study of the hygienic quality of the water in a growing-fattening piggery showed that the degree of impurity was: at source (ammonium 0.05 mg/1; nitrites 0.002 mg/1; nitrates 63 mg/1; coliform index 200/1); on the water supply circuit (ammonium 0.28 mg/1; nitrites 0.01; organic substances 23 mg KMnO 4/1; coliform index 280/1); and in the watering troughs (ammonium 1.1. mg/1; nitrites 0.77 mg/1; nitrates 81 mg/1; organic substances 302 mg KMnO 4/1; total number of microorganisms 5 x 108/ml; coliform index 4 x 108/1 and fungal spores 9 x 104/m1). Determinations of the main microorganism groups (staphylococci, streptococci, coliforms, anaerobes and funji) in the water of the drinking troughs with continuous and intermittent flows indicated a larger microorganism population in the troughs with intermittent flow where a correction of the potability of the water is necessary.--Copyright 1975, Biological Abstracts, Inc.

HYGIENIC STANDARDIZATION OF FLOTATION REAGENT BB-2 AND ITS COMPONENTS AS INDUSTRIAL CONTAMINANTS OF WATER BODIES, (IN RUSSIAN),
Kazanskii Gosudarstvennyi Meditsinskii Institut (USSR).
A. V. Ivanov.
Gig Sanit. 38(9), p 14-19, 1973.

Descriptors: *Industrial wastes, Flotation, *Water quality standards, Organoleptic properties, Water pollution.
Identifiers: *Flotation reagent BB-2.

Standards for the maximum permissible concentrations of flotation reagent BB-2 should be set at a level of 2.4 mg/1 according to organoleptic signs of noxiousness. Using the same criteria, the maximum permissible concentrations for the components of BB-2 are recommended to be 0.44 mg/1 for 1,2-pentadiole, 0.40 mg/1 for 1,5-pentadiole and 0.79 mg/1 for 1,4,5-pentantriole. Experiments to determine the LD50 were carried out with mice, rats, guinea pigs and rabbits.--Copyright 1975, Biological Abstracts, Inc.

COASTAL WATER RESEARCH PROJECT. ANNUAL REPORT FOR THE YEAR ENDED 30 JUNE 1975,
Southern California Coastal Water Research Project, El Segundo, Calif.
Southern California Coastal Water Research Project, Annual Report for the Year Ended 20 June 1975, 1975. 215 p, 47 fig, 40 tab, 1 ref, 4 append.

Descriptors: *Ecosystems, *Environmental effects, *Pollutant identification, *Resources development, *Water resources, *Water pollution sources, *Water pollution effects, *Water quality control, *Coasts, Continental shelf, Biology, Fish diseases, Toxicity, Invertebrates, Metals, Engineering, Management, Facilities.
Identifiers: *Outer Continental Shelf, Trace metals, Chlorinated hydrocarbons, Environmental impact.

The Coastal Water Research Project was organized in 1969 to make scientific studies of the problems of pollution in the coastal waters of California, especially those associated with the discharge of municipal wastes. The goal is to become expert on the subject of ocean pollution by making and reporting careful measurements of the quantities and movements of pollutants and of their effects. The special value of this project comes from looking 'beyond the ends of the pipes' at the regional ecological situation and trying to determine the effects of all factors that influence marine life so that any changes can be seen in the true perspective of natural biological variability and other acts of man. This report describes the main points of progress during the fiscal year ending 30 June 1975. Research, including extensive work at sea and in the laboratories is discussed; findings are summarized as a list of partial answers to key questions; and persons involved and the funds spent are listed. Separate reports are included on: the biology program; toxicity; invertebrate ecology; fish ecology; chemical pollutants; engineering program; and management and facilities. (Sinha-OEIS)

OPERATIONAL MODEL FOR PREDICTING THE MOVEMENT OF OIL IN CANADIAN NAVIGABLE WATERS,
Canada Centre for inland Waters, Burlington (Ontario).
T. J. Simons, G. S. Beal, K. Beal, E. Shaarawi, and T. S. Murty.
Marine Sciences Directorate Manuscropt Report Series No. 37, 1975. 30 p. 4 fig.

Descriptors: *Computer programs, *Oil pollution, *Oil spills, *Canada, *Navigable waters, Water resources, Climatology, *Tidal effects, *Estuaries, Data collections, Models, Feasibility studies, St. Lawrence Seaway.
Identifiers: St. Lawrence Estuary.

The feasibility of an operational model to compute the movement of oil slicks in Canadian navigable waters is demonstrated. Some guidelines for establishing a data bank on the topographies of the water bodies, climatology of the various regions and tidal currents in different locations are developed. Descriptions of the computer programs and the relevant subroutines are included. In view of continuing changes in navigational routes and economically favored terminals, and planning of potential future sites, it is recognized that the data bank would require continual updating and expansion. This, however, is a relatively straght-forward matter and does not require any modifications in the basic operational scheme as described. A complete documentation of the program is presented with a simulation of a hypothetical oil spill in the St. Lawrence estuary. (Sinha - OEIS)

ORGANIC SEDIMENT MODEL FOR WASTEWATER OUTFALL,
Tetra Tech, Inc., Lafayette, Calif.
C. W. Chen, D. J. Smith, J. D. Jackson, and J. D. Hendrick.
In: Symposium On Modeling Techniques Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 179-207, 1975. 14 fig, 2 tab, 11 ref.

Descriptors: *Model studies, *Organic wastes, *Sediments, *Outfall sewers, Mathematical models, Waste water(Pollution), Sedimentation, Dispersion, Benthic fauna, Benthos, Biota, Heavy metals, Biochemical oxygen demand, Suspended solids, Bacteria.
Identifiers: *Organic sediments.

In addition to bacterial contamination of beaches, marine wastewater discharges can create environmental problems through accumulation of organic sediments near the outfall. Organic sediment modifies the living environment of benthic animals, causing populations to change, composition to shift, and subtrates to become enriched by heavy metals or other toxic materials. An organic sediment model was developed to follow the processes of sediment accumulation through sedimentation, lateral dispersion, decay, resuspension and dispersion of settling particles of sewage origin. The model was applied to four outfalls under various operating conditions. Available data indicate the veracity of the model. Wider applications of the model, better definition of input data, and capability of the model to consider current characteristics at different strata of water column can improve the results. They in turn can contribute to the goal of designing the outfall system for the protection of indigenous biota. (See also W76-09941) (Sims - ISWS)

PARTICLE-LADEN JETS WITH APPLICATION TO OCEAN DUMPING,
Delaware Univ., Newark. Dept. of Civil Engineering and Marine Studies.
J. D. Ditmars, and M. J. McCarthy.
In: Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 335-351, 1975. 7 fig, 12 ref.

Descriptors: *Model studies, *Jets, *Dispersion, Diffusion, Mathematical models, Hydraulic models, Numerical analysis, Laboratory tests, Saline water, Freshwater, Waste disposal, Hydraulics.
Identifiers: *Particle-laden jets, Particle spreading.

The applicability of single-phase buoyant jet models for the prediction of the gross features of particle-laden jets discharged into coastal waters was considered. Laboratory experiments of a continuous discharge into a stagnant, uniform density receiving water were performed for a saltwater jet and three particle-laden jets, all with the same densimetric Froude number. Measurement of concentration profiles within the four different jets indicated different jet behavior for each case. An analysis of the particle-laden jet using the integral similarity approach was presented for the prediction of jet velocity, particle concentration, and width as a function of distance from the discharge. The effect of the particle slip relative to the fluid motion was included. The experimental results and model predictions were used to evaluate the model and to determine an effective spreading coefficient or turbulent Schmidt number for particles. The study indicated that the spreading of particles is less than that of momentum for large values of the ratio of particle fall velocity to jet discharge velocity. (See also W76-09941) (Sims-ISWS)

TEMPERATURE PREDICTIONS FOR OFFSHORE POWER PLANTS,
Massachusetts Inst. of Tech., Cambridge. Energy Lab.
E. E. Adams, and D. R. F. Harleman.
In: Symposium on Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 352-367, 1975. 5 fig, 1 tab, 13 ref.

Descriptors: *Heated water, *Powerplants, *Ocean circulation, *Model studies, Nuclear powerplants, Thermal water, *Thermal pollution, Oceans, Coasts, Cooling, Dispersion, Mixing, Circulation, Mathematical models, Currents(Water), Ocean currents.
Identifiers: *Offshore powerplants.

A far field model was developed and applied to the prediction of ocean temperatures caused by the thermal discharges from a proposed offshore

ower plant. The model calculated three-dimen-ional excess temperatures by superimposing the emperature distributions resulting from discrete, ertically-distributed line sources which are reated by the method of moments. Ambient cur-ents which can vary in the vertical direction and time, surface heat loss, and turbulent diffusion all directions were considered. The presence nd dynamic effect of the near field was handled xplicitly by representing dilution and the size and ocation of the near field mixing zone as a known unction of time. The model was compatible with he type and extent of field data most easily col-cted-namely, time series data from moored cur-ent meters and diffusion experiments using dye or rogues. Because numerical integration is only equired in the vertical direction and in time, the odel should be useful for generating inexpensive ransient temperature estimates for extended eriods of time or for quickly comparing far field eat transport characteristics at a number of dif-erent locations. AMPLING NETWORK DESIGN FOR DISPER-ION VERIFICATION,
Massachusetts Inst. of Tech., Cambridge. Dept. of ivil Engineering.
. R. Pearce, R. N. DeGuida, G. C. Dandy, and S. . Moore.
n: Symposium On Modeling Techniques, Volume ; 2nd Annual Symposium of the Waterways, Har-ors and Coastal Engineering Division of ASCE (2 ol.), San Franciso, California, September 3-5, 975. American Society of Civil Engineers, New ork, p 368-379, 1975. 2 fig, 1 tab, 8 ref.

Descriptors: *Model studies, *Dispersion, Suspended solids, *Networks, *Sampling, Dredging, Mathematical models, Numerical analy-is, Bays, Circulation, Tides, *Network design, ath of pollutant, Massachusetts.
dentifiers: *Dispersion models, *Massachusetts ay.

Collection of accurate field data is necessary for erification of pollutant dispersion predictions. Due to the complexity of space and time depen-ent concentrations, and the high costs of obtain-g data, there is a need for a quatitative ethodology for design of sampling networks. A wo-dimensional finite element dispersion model as used in which the circulation pattern inputs an be determined by a compatible circulation odel. These models were applied to Mas-achusetts Bay, where a large-scale dispersion ex-eriment was performed in June 1973. The objec-ve was to simulate a proposed dredging operation f a valuable deposit of sand and gravel. The ex-eriment proved to be very costly, while the esults were of marginal value. The objective of he present research was to devise a useful ethodology for design of sampling networks for ispersion experiments. The immediate objective as evaluation of Estimation Theory as a can-idate technique, as applied to the case study of lassachusetts Bay. (See also W76-09941) (Sims - SWS)

HYDRODYNAMIC TRANSPORT PHENOMENA IN ESTUARIES AND COASTAL WATERS: SCOPE OF MATHEMATICAL MODELS,
Waterloopkundig Laboratorium, Delft (Netherlands).
C. B. Vrengdenhil, and J. Voogt.
In: Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 690-708, 1975. 1 fig, 26 ref, 2 append.

Descriptors: *Model studies, *Mathematical models, *Estuaries, Coasts, Hydrodynamics, Tidal effects, Flow, Velocity, Water circulation, Salinity, Hydraulics.
Identifiers: *Model techniques.

An analysis was given of the assumptions in different types of mathematical models for the transport of water and other quantities in estuaries and coastal waters. The starting-point was formed by the equations for three-dimensional turbulent flow. An estimate of the importance of various terms was given. By several averaging processes, increasingly simpler models were obtained, but the interpretation of coefficients became increasingly more difficult. Also the numerical possibilities were discussed, with special emphasis on aspects of accuracy and non-linear stability which are considered the most important numerical problems. Attention was limited to nearly horizontal flow, although the influence of short waves on these flows was also treated. (See also W76-09941) (Sims - ISWS)

APPLICATION OF WATER QUALITY MODELS TO FINGER FILL CANALS,
Environmental Protection Agency, Athens, Ga. Surveillance and Analysis Div.
T. O. Barnwell,Jr., and T. R. Cavinder.
In:Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 709-728, 1975. 7 fig, 1 tab, 7 ref.

Descriptors: *Model studies, *Mathematical models, *Canals, *Florida, Water circulation, Water quality, Dye releases, Computer models, Sedimentation, Suspended solids, Biological properties, Water chemistry, Simulation analysis, Dispersion, Hydrology.
Identifiers: *Finger fill canals.

To assess the impact of finger fill canal developments on water quality, EPA Region IV conducted studies on several Lower Florida Canal systems. An attempt was made to model dye studies in the canals using the Receiving Waters Block of the Storm Water Management Model (SWMM). SWMM did not accurately reproduce dye profiles but a different version of the model, the Columbia River Model, did. SWMM's failure lies in omission of dispersion in the mass transport expression. Dispersion appears to be the major transport mechanism in finger fill canals. (See also W76-09941) (Sims-ISWS)

G. C. April, D. O. Hill, and H-A. Lin.
In: Symposium on Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York p 764-782, 1975. 7 fig, 2 tab, 10 ref. NASA NAS8-29100.

Descriptors: *Model studies, *Mathematical models, *Pollutants, *Water pollution, *Estuaries, *Alabama, Computer models,Streamflow, Rivers, Bays, Coasts, Hydrodynamics, Salinity, Path of pollutants, Coliforms, Water quality, Winds.
Identifiers: *Mobile Bay(Ala).

The purpose of this study were to formulate a hydrodynamic and material transport mathematical model for Mobile Bay and to investigate the influences that river flow rate, wind direction and speed, coliform loading and bay temperature have on bay behavior using the verified models. Results of a detailed parametric study were reported aas tidal cycle average current and salinity profiles, and monthly average coliform profiles. For current and salinity distributions, wind (above 15 knots) effects and river flow rate are significant in shaping the patterns within the bay. Coliform concentration profiles are likewise strongly influenced by river flow rate and water temperature. In all cases, computing efficiency and perceptibility of computer output were of major consideration in the formulation of the Mobile Bay model. (See also W76-09941) (Sims-ISWS)

APPLICATION OF PHYSICAL TIDAL MODELS IN HARBOR AND MARINA DESIGN,
Washington Univ., Seattle. Dept. of Civil Engineering.
R. E. Nece, and E. P. Richey.
In: Symposium on Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 783-801, 1975. 16 fig, 7 ref.

Descriptors: *Model studies, *Marinas, *Harbors, *Washington, Hydraulic models, Pollutants, Water quality, Tidal effects, Tidal waters, Mixing, Dispersion, Water circulation, Water pollution, Estuaries.
Identifiers: *Tidal flushing, *Puget Sound(Wash).

Small scale physical models are efficient, economical tools in the evaluation of designs for small harbors and enclosed marinas where quality problems associated with circulation and tidal exchange are important. Techniques used in such small models for determining flushing characteristics and internal circulation patterns of marinas were presented. The utility of various visual methods for information transfer to various agencies involved with the assessment of a project in its early design phases was discussed. Some generalized features relating planform geometry, tidal range, and entrance configurations to flushing and internal mixing characteristics based on model studies of six marinas, existing or proposed, in Puget Sound, Washington were presented. The application of flushing data obtained from physical model studies to predictive water quality models in the evaluation of proposed designs is a desired result of the studies; one such coupling was presented. CONCENTRATION OF CESIUM-137 IN AQUATIC ORGANISMS, WATER AND BOTTOM DEPOSITS OF WATER BODIES WITH A DIFFERENT MINERAL COMPOSITIONS OF THE WATER, (IN RUSSIAN),
Polyarnyi Nauchno-Issledovatelskii i Proektnyi Institut Morskogo Rynogo Khozyaistva i Okeanografii, Murmansk (USSR).
N. I. Buyanov, and T. M. Antonenko.
Vopr Ikhtiol. 15(1); p 176-179, 1975.

Descriptors: Cesium, Aquatic animals, *Benthos, Fish, *Trophic level, Reservoirs, *Mineralogy, *Fish food organisms, Absorption, Radioisotopes, Sampling.
Identifiers: *Cesium-137.

Specimens of water, bottom deposits, benthos and fishes belonging to several trophic levels were collected from 3 reservoirs having different levels of water mineralization. The concentration of Cs137 due to global atmospheric fallout in fishes was inversely proportional to the mineralization of the water. The concentration of Cs137 in fishes of higher trophic levels was higher than in organisms of the 1st trophic levels. The presence of a direct effect of trophic levels permits indirect demonstration of the predominant role of food in the uptake of radiosotopes into fish.--Copyright 1975, Biological Abstracts, Inc.

ADDITIONAL OBSERVATIONS ON THE EFFECTS OF STRIP MINING ON SMALL-STREAM FISHES IN EAST-CENTRAL KENTUCKY,
Eastern Kentucky Univ., Richmond. Dept. of Biological Sciences.
B. A. Branson, and D. L. Batch.
Transactions of Kentucky Academy of Science, Vol. 35, No. 3-4, p 81-82, December 1974, 2 tab, 1 fig, 1 ref.

Descriptors: *Strip mines, *Appalachian Mountain region, *Sedimentation, *Fish reproduction, Fish food organisms, Streams, Silting, Turbidity, Fish eggs, Minnows, Darters, Kentucky.
Identifiers: *Kentucky River(Kent).

Continued siltation from strip mine operations in two streams tributary to the North Fork of the Kentucky River has prevented the recovery of fish populations in those streams. All species reported from Leatherwood Creek in 1972 have been forced downstream, and six of those species are now absent from that stream. Two other species are now missing from both streams. Populations of Semotilus atromaculatus apparently are on the increase, perhaps because of the removal of competing species. (Curtis-Forest Service)

COMBINED EFFECTS OF RADIOACTIVE, CHEMICAL AND THERMAL RELEASES TO THE ENVIRONMENT,
International Atomic Energy Agency, Vienna (Austria).
Available from UNIPUB, Box 433, Murray Hill Station, New York, N.Y. 10016. Proceedings of a symposium held in Stockholm, June 2-5, 1975. STI/PUB/404, 358 p.

Descriptors: *Environmental effects, *Conferences, *Radiation, *Thermal pollution, Chemical wastes, Effluents, Radioisotopes, Absorption, Radioactivity effects.
Identifiers: Synergism, *Combined effects(Pollutants).

The symposium was sponsored by the International Atomic Energy Agency in cooperation with the OECD Nuclear Energy Agency. The proceedings contains a total of 22 papers from 9 countries and one international organization. A panel discussion is included that examined a number of important questions concerning the combined effects of releases to the environment from the nuclear and other industries. Topics covered in the seven sessions included: effects of temperature on radionuclide uptake, synergism and combination effects in aquatic systems, effects of chemical releases on radionuclide uptake, synergism and combination effects from releases to the atmosphere, and other factors in the assessment of synergistic and combination effects. (See W76-09491 thru W76-09509) (Chilton-ORNL)

INTERACTION MECHANISMS OF RADIOACTIVE, CHEMICAL AND THERMAL RELEASES FROM THE NUCLEAR INDUSTRY, METHODOLOGY FOR CONSIDERING COOPERATIVE EFFECTS,
Institut fur Medizinische Strahlenphysik und Strahlenbiologie, Klinikum Universitats, Essen, Federal Republic of Germany.
C. Streffer.
In: Combined effects of Radioactive, Chemical and Thermal Releases to the Environment, Proceedings of a Symposium held in Stockholm, June 2-5, 1975. IAEA-SM-197/22. p 3-13, 1 fig, 34 ref.

Descriptors: *Environmental effects, *Radioactivity effects, *Thermal effects, *Chemicals, Radiosensitivity, Methodology.
Identifiers: Synergism.

Data is reported for radiosensitizing agents. The action of radiation on the biological functions and metabolism of DNA are discussed and it is indicated that part of the radiation effects in DN can be repaired and that living cells can recove from radiation damage. The reactions of a group radiosensitizers which interacts with DNA or th DNP-complex to change the configurational structure or metabolism is discussed. Antibiotics such as actinomycin D, SH-blocking agents have effe in these interactions. The electron affinic chemcals such as nitro-compounds, ketones, etc. a identified as a second group of radiosensitizer The problem of possible synergistic effects arisi from the chemicals and radiation from the nucle industry is considered. IMPACT OF THERMAL AND RADIOACTIV EFFLUENTS ON A TROPICAL NEARSHOR ECOSYSTEM,
Bhabha Atomic Research Centre, Bombay (India Health Physics Div.
B. Patel, M. C. Balani, S. Patel, V. K. Soman, and S. D. Soman.
In: Combined Effects of Radioactive, Chemic and Thermal Releases to the Environmen Proceedings of a Symposium held in Stockhol June 2-5, 1975. IAEA-SM-197/2. p 17-34, 5 tab, fig, 32 ref.

Descriptors: *Environmental effects, *Therm pollution, *Radioactivity, Oysters, Clam Aquatic environment, Ecosystems, Population Water pollution effects.
Identifiers: Synergism, India.

Possible effects are discussed of elevated te peratures on the bioaccumulation of a few fissio and corrosion-product radionuclides and the pos ble synergistic effects of the chemical on certa lamellibranchs. Populations of oysters, ark-sh blood clams and the venerid clam were tra ported to a discharge canal for field studies. An ysis of gamma spectra of these populatio showed photopeaks which were identified as bei due to Cs 137, Co 58, 60, and I 131. The oyst populatiom also showed a photopeak which w identified as being due to Zn 65. The impact temperature on filtration rate was studied wi blood clams in the laboratory. The filtration ra increased with increasing temperature from 21 30 degrees C. With further rise in temperature, t rates declined slightly, eventually remaining mo or less constant between the range of 31 to degrees C. The effect of 2 ppm of chromium af 24 hours acclimation at various temperatures w a depressing one and the depressing effect creased with temperature from 21 to 28 degrees (See also W76-09490) (Chilton-ORNL)
W76-09492

THE EFFECT OF TEMPERATURE ON THE U TAKE AND RETENTION OF CO 60 AND ZN BY THE COMMON SHRIMP CRANGON CRA GON (L),
Reactor Centrum Nederland, Petten, N. H., Th Netherlands.
A. W. van Weers.
In: Combined Effects of Radioactive, Chemic and Thermal Releases to the Environmen Proceedings of a Symposium held in Stockhol June 2-5, 1975. IAEA-SM-197/10. p 35-49, 3 tab fig, 14 ref.

Descriptors: *Environmental effects, *Therm pollution, *Radioisotopes, *Shrimp, Cobalt, Zin Food, Retention, Temperature, Water pollut effects, Absorption.

The mean concentration factor of Zn65 in whole shrimps after 16-21 days of the uptake experiments ranged from 30-60 and of Co60 from 6-10. The loss of Co60 and Zn65 observed at moulting indicates that adsorption to the exoskeleton plays an important role in the accumulation. Both moulting frequency and rate of food uptake are seen to increase with temperature. Reduction of the biological half-lives of Co60 and Zn65 by a factor of about two for an increase of 10 degrees C in temperature was observed. Temperature increase will result in an increased food uptake and therefore, an increased growth rate. Because of the resulting increase of the rate of turnover of the radionuclides, equilibrium between the concentrations in shrimps and those in the food organisms will be reached more quickly. (See also W76-09490) (Chilton-ORNL)
W76-09493

INFLUENCE DE LA TEMPERATURE SUR LA CONTAMINATION D'ESPECES MARINES PAR LE FER-59, (INFLUENCE OF TEMPERATURE ON THE CONTAMINATION OF MARINE SPECIES BY IRON-59),
Laboratoire de radioecologie marine, Centre de La Hague, Cherbourg, France, Departement de protection.
A. Fraizier, and J. Ancellin.
In: Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment, Proceedings of a Symposium held in Stockhom, June 2-5, 1975. IAEA-SM-197/15. p 51-66, 2 tab, 6 fig, 23 ref.

Descriptors: *Environmental effects, *Temperature, *Radioisotopes, Iron, Fish, *Mollusks, Water pollution effects, Thermal pollution.
Identifiers: *Iron-59.

The marine mollusc, Mytilus edulis, and the fish, Blennius pholis, were used to study their interactions with Fe 59. Emphasis was placed on the physiochemical states of the radionuclide and temperature. Contamination appears to be dependent on temperature and this factor partly influences the physiochemical state of the radionuclide and the metabolic activity of the species. SWEDISH STUDIES ON COMBINATION EFFECTS OF THERMAL DISCHARGES IN THE AQUATIC ENVIRONMENT, SOME ASPECTS OF POWER PLANT SITING POLICY,
Swedish Environment Protection Board, Stockholm, Sweden.
U. Grimas, and U. Ehlin.
In: Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment, Proceedings of a Symposium held in Stockholm, June 2-5, 1975. IAEA-SM-197/24, p 69-81, 6 fig, 1 tab.

Descriptors: *Environmental effects, *Water quality, *Thermal pollution, Heat, Oxygen, Cooling water, Water pollution effects, Organic matter.
Identifiers: Negative effects, Mineralization.

Transport mechanisms which involve the direct use of the energy of cooling water discharges are discussed. Speeding up the mineralization of organic matter by addition of heat and oxygen is expected to result in an improvement of water quality. Three examples are discussed where cooling water discharges in polluted areas appear to end up in producing negative effects-a discharge in the innermost part of a long series of semi-enclosed basins, in the mouth of a large estuarine basin, and due to combination effects with toxic metals such as mercury. In choosing between possible sites, areas have to be identified where the available energy of the discharge can be used to improve water quality rather than be lost to the environment. (See also W76-09490) (Chilton-ORNL)
W76-09495

EVALUATION OF THE THERMAL EFFECTS OF A NUCLEAR POWER PLANT,
Ente Nazionale per l'Energia Elettrica, Rome, Italy.
E. Ioannilli, and E. Smedile.
In: Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment, Proceedings of a symposium held in Stockholm, June 2-5, 1975. LAEA-SM-197/5, p 83-94, 4 fig, 2 ref.

Descriptors: *Environmental effects, *Thermal pollution, Model studies, Assessments, Environmental control, Nuclear powerplants, Water pollution effects.

The approach to environmental problems as applied to the coarse Nuclear Power Plant includes the prediction and assessment of power plant impact. The predictive studies involve laboratory work, model research and experimentation on an existing plant located on a site biologically similar to the proposed site. The studies are intended to permit the preparation of a predictive model to be applied to the proposed and future plants. Detailed assessment of the biological resources and chemical parameters in the preoperational phase will be compared statistically with new assessment during operation. (See also W76-09490) (Chilton - ORNL)

BIOLOGICAL EFFECTS OF SIMULATED DISCHARGE PLUME ENTRAINMENT AT INDIANPOINT NUCLEAR POWER STATION, HUDSON RIVER ESTUARY, USA,
New York Univ., Medical Center, N. Y. Inst. of Environmental Medicine.
G. R. Lanza, G. J. Lauer, T. C. Ginn, P. C. Storm, and I. Zubarik.
In: Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment, Proceedings of a symposium held in Stockholm, June 2-5, 1975. LAEA-SM-197/25. p 95-126, 16 tab, 8 fig, 9 ref, 1 append.

Descriptors: *Environmental effects, *Thermal pollution, *Chlorination, *Phytoplankton, Copepods, Juvenile fish, Model studies, *Hudson River, New York, Water pollution effects.

Experiments carried out to examine the effects of simulated plume entrainment upon phytoplankton assemblages showed in one case that the majority of phytoplankton assemblages displayed no measurable effects on photsynthetic activity or chlorophyll a content while another occasion at different ambient temperature resulted in decreased photosynthetic activity. There were no statistically significant differences between survival of ambient exposure groups of copepods and test groups exposed to simulated plume temperatures. Test copepods exposed to chlorinated samples displayed low survival rates. The amphipod, Gammarus spp. did not appear to suffer significant mortality during simulated entrainment. Juvenile striped bass were not affected by simulated plume transit. (See also W76-09490) (Chilton-ORNL)
W76-09497

EFFECT OF ENTRAINMENT IN POWER STATION COOLING SYSTEMS STUDIED USING PERIPHYTIC COMMUNITIES,
Ente Nazionale per l'Energia Elettrica, Rome, Italy.
E. Smedile, and V. Parisi.
In: Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment, Proceedings of a symposium held in Stockholm, June 2-5, 1975. LAEA-SM-197/6. p 127-142, 4 tab, 7 fig, 14 ref.

Descriptors: *Environmental effects, *Thermal pollution, Biota, Seston, *Entrainment, Water pollution effects, *Periphyton.
Identifiers: Colonization.

The studies were aimed at quantifying the difference in biota composition between the intake and outfall and to evaluate the detrimental effects on the organisms. A particularly dynamic study was a comparison of the ability of suspended organisms in the river water ahead of the plant and in the discharge canal to colonize immersed substrates. From a comparison of the patterns of colonization it was possible to hypothesize that the functional capacity of the tygmophil organisms of the bioseston is not affected by passage through the condensers. The data demonstrated how a temperature rise modifies the characteristics of a periphytic community and the dynamics of colonization of immersed substrata. (See also W76-09490) (Chilton-ORNL)

CHARACTERISTICS OF COASTAL CIRCULATION AFFECTING THE TRANSPORT AND DISPERSION OF MATERIAL RELEASED FROM THE NUCLEAR INDUSTRY,
Energy and Research and Development Administration, Washington, D. C.
J. O. Blanton.
In: Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment, Proceedings of a symposium held in Stockholm, June 2-5, 1975. IAEA-SM-197/21, p 255-268, 7 fig, 20 ref.

Descriptors: *Environmental effects, Pollution, Coasts, *Water circulation, Winds, *Dispersion, Nuclear powerplants, Currents(Water), Thermocline, Path of pollutants, *Lake Ontario, Lakes.

Future increase in the number of nuclear power plants and associated industry necessitates an ob-

jective assessment of the capacity of the coastal water to transport and disperse the wastes from the nuclear industry that are ejected nearshore. These studies represent an attempt to obtain the spatial and tempral resolution necessary to describe circulation in the coastal zone. Data taken during thermally stratified conditions in Lake Ontario indicate the existence of a zone extending 8 to 10 km from the shore where upwelling and downwelling of the thermocline is confined. The root-mean-square (rms) speeds of the currents are a small fraction of the along-shore velocity component in this zone. Beyond this zone the rms speeds dominate the flow regime and are 2 to 10 times the mean velocity. An important characteristic of dispersion and transport of suspended matter is the large time lag of as much as three days seen in current reversals across the coastal zone which result in episodes of large lateral shear. High shear values do not coincide with high winds but are related to the inability of the nearshore currents to adjust to a slowly varying wind regime. The time for adjustment decreases as water depth nearshore decreases. (See also W76-09490) (Chilton-ORNL)

A SITE STUDY OF THE MULTIPLE EFFECTS OF THERMAL RELEASES ON THE AQUATIC LIFE IN AN ESTUARINE AREA,
Ente Nazionale per l'Energia Elettrica, Milan (Italy).
D. Borgese, G. Dinelli, L. Guzzi, and E. Smedile.
In: Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment, Proceedings of a symposium held in Stockholm, June 2-5, 1975. IAEA-SM-197/27. p 269-284, 1 tab, 4 fig, 10 ref.

Descriptors: *Environmental effects, *Model studies, *Thermal pollution, Aquatic life, *Estuaries, Heat, Chlorine, Oxygen, Salinity, Water pollution effects.
Identifiers: Synergism, *Po River Delta(Italy).

A detailed research program on the Po River Delta was established to study the structure of the plant and animal populations, primary production and bacterial activity, physical and chemical characteristics of estuarine waters, coastal characterization, and thermal effects on the biocenosis entering condensers of existing plants. The synergistic effects of heat, chlorine, oxygen and salinity stresses will be established. The data will be used to develop cause-and-effect modelling techniques for relating the local effects of a thermal discharge to their regional consequences. The formulation of predictive impact models will be validated by experiments to provide empirical corrections as required. (See also W76-09490) (Chilton-ORNL)

THE EFFECT OF TEMPERATURE ON THE BEHAVIOR OF MARINE FISHES, A COMPARISON AMONG ATLANTIC MACKEREL, SCOMBER SCOMBRUS, BLUEFISH, POMATOMUS SALTATRIX, AND TAUTOG, TAUTOGA ONITIS,
National Marine Fisheries Service, Highlands, N. J. Sandy Hook Lab.
B. L. Olla, A. L. Studholme, A. J. Bejda, C. Samet, and A. D. Martin.
In: Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment, Proceedings of a symposium held in Stockholm, June 2-5, 1975. IAEA-SM-197/4. p 299-308, 4 fig, 1 tab, 13 ref.

Descriptors: *Environmental effects, *Thermal pollution, Temperature, Fish, Fish behavior, Water pollution effects.
Identifiers: *Bluefish, *Atlantic Mackerel, *Tautog.

The comparisons of behavioural responses of the fish to temperature were conducted under controlled laboratory conditions. Under changed temperature conditions, either elevated or lowered, the juvenile and adult bluefish and the adult Atlantic mackeral increased their swimming speeds by 61-190%. This was interpreted as behavioural avoidance to a particular level of temperature and indicated an ability for directive movements in relation to ambient temperature. In contrast to these pelagic species, the tautog, a demersal species which is tied to a particular locus for part of its life and which lives in close association with objects providing cover, was limited in its ability to respond to stress by moving away. Thermal stress caused tautogs to reduce their activity and to exhibit an increased association with cover in the young. Adults did not increase their association with cover. CYCLING OF FE55 AND ZN65 IN COLUMBIA RIVER CARP FOLLOWING REACTOR SHUTDOWN,
Oregon Coll. of Education, Monmouth.
W. M. Jones, C. D. Jennings, and N. H. Cutshall.
In: Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment, Proceedings of a symposium held in Stockholm, June 2-5, 1975. IAEA-SM-197/19. p 309-318, 5 fig, 1 tab, 13 ref. AT(45-1)2231, AT(45-1)2227.

Descriptors: *Environmental effects, *Radioactivity effects, Radioisotopes, Model studies, Carp, Iron, Zinc, *Columbia River.
Identifiers: *Fe-55, *Zn-65.

Declines of Fe55 and Zn65 were observed in the tissues of carp following shutdown of the plutonium production reactor at Hanford, Washington. A model for decrease in specific activity was tested for carp flesh and it was found that the loss of Fe55 from carp hearts was faster than the other tissues while the loss rate of Zn65 from hearts appeared to be slowest. The following decreasing order of loss rates of Fe55 from one tissue to another is suggested: heart, eggs, flesh, liver. Zn65 showed no statistically significant difference in loss rates between tissues but the following decreasing trend was suggested: skin, flesh, eggs-liver, heart. The ability of an organism to free itself of radionuclide contamination will depend on what portion of the organism is contaminated and what radionuclide is involved. Descriptors: *Environmental effects, *Thermal pollution, Fish, Temperature, *Cytological studies, Water pollution effects.
Identifiers: Acclimation temperature, *Goldfish.

Cellular proliferation of undifferentiated erythropoietic precursors in the goldfish acclimated at 5, 10, 20, 30, and 35 degrees C were studied. The duration of cellular cycle from the decrease in the number of grains per nucleus with time were investigated using high resolution autoradiography and DNA labeling. For high acclimation temperatures, an increase in the labelled cell fraction and in the number of grains per nucleus were observed with a shortening of the nitotic cycle. Uptake of tritiated thymidine in intestinal and haematopoietic tissue showed an increased uptake in the haematopoietic tissue with increased temperature and a decrease in uptake by intestinal tissue between 20 and 25 degrees C. SURVEYS ON RADIATION-RESISTANT ASPOROGENIC BACTERIA IN NATURAL ENVIRONMENTS,
Tokyo Univ. (Japan). Lab. of Radiation Genetics.
K. Yano, B. Cho, T. Yoshinaka, and H. Yamaguchi.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/202. p 85-98, 6 fig, 2 tab, 28 ref.

Descriptors: *Radioecology, *Radiation, *Bacteria, Resistance, Environment, Environmental effects, *Surveys, Water pollution effects, Path of pollutants, *Pollutant identification, Sampling.

More than 200 samples were tested including rice grains, faeces of various kinds, and water, mud and soil from areas that were both specific or non-specific for natural or artificial radiation. Highly and extremely radioresistant bacteria which retain only a vegetative form in life had been accidentally discovered after radiosterilization of foods. It was demonstrated that the survey of soil for asporogenic radioresistants was not successful. The results from an aqueous environment were more fruitful with five strains being isolated from a radioactive spring at Misasa. The case of rice grains was particularly noteworthy in connection with the possible presence of a plant symbiont. No radioresistant was discovered in the faeces of animals. The direct function of pigment as a protective agent for ionizing radiation has not been proven but it was noted that all the radioresistants so far isolated produced reddish pigment(s). BIOLOGICAL EFFECTS OF HIGH-ENERGY ELECTRON IRRADIATION OF MUNICIPAL SLUDGE,
Massachusetts Inst. of Tech. Cambridge.
A. J. Sinskey, D. Shah, K. A. Wright, E. W. Merrill, and S. Sommer.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/302. p 139-149, 7 fig, 17 ref.

Descriptors: *Sewage treatment, *Sludge treatment, *Irradiation, Municipal wastes, Disinfection.
Identifiers: High energy electron irradiation, High Voltage Research Laboratory, Electron accelerator.

Preliminary results are presented on the biological effectiveness of high-energy electron treatment of municipal sludge. Positive conclusions include the requirement for blending of raw sludge for maximum effectiveness of the electron beam. Introduction of oxygen in raw sludge leads to increased microbial inactivation. The use of intermittent oxygenation permitted a lowering of the treatment dose. The irradiations were performed at the High Voltage Research Laboratory using a compressed gas-insulated 4-MeV Van de Graaff

ectron accelerator, which was operated on simu-
ted or actual sewage at 3 MV for most of the stu-
es. The selection of doses depended on the sen-
ivity of the organisms and effects under study.

STUDIES ON THE METABOLISM OF A SULFUR-OXIDIZING BACTERIUM. VII. PURIFICATION AND CHARACTERIZATION OF SOLUBLE COMPONENTS INDISPENSABLES FOR SULFUR OXIDATION BY THIOBACILLUS THIOOXIDANS,
Nagoya Univ. (Japan). Biological Inst.
S. Takakuwa.
Plant and Cell Physiology, Vol. 16, No. 6, p. 1027-1035, 1975. 4 fig., 3 tab., 20 ref.

Descriptors: *Metabolism, *Sulfur bacteria, *Biochemistry, *Oxidation, Iron, Proteins, Enzyme, Chelation, Heavy metals, Inhibitors.
Identifiers: *Thiobacillus thiooxidans, Flavoproteins, Sulfur oxidation.

To understand the sulfur oxidation mechanism in Thiobacillus thiooxidans, the nature of a collodion membrane-impermeable soluble fraction was studied. This fraction was required for the sulfur-oxidizing system of Thiobacillus. It was resolved into two components by ammonium sulfate fractionation, Amberlite CG-50 and DEAE cellulose column chromatography, and Sephadex gel filtration. Both components were needed for sulfur oxidation. The first component had a molecular weight of 120,000 and was a non-heme iron protein. The absorption maximum of the oxidized form was 410 nm but reduction shifted it to 420 nm. The second component was a new flavoprotein containing non-heme iron. It also showed an absorption change at 410 nm, but there was a shoulder at 485 nm in the oxidized form which disappeared on reduction. Its molecular weight was 23,000 by gel filtration. Metal-chelating agents like EDTA, sodium diethyl dithiocarbamate, and o-phenathroline inhibited the reconstituted system's sulfur-oxidizing activity. Several nucleotides, which are known flavoprotein inhibitors, inhibited the sulfur-oxidizing activity. Removal of iron from soluble fraction components with potassium cyanide or sodium diethyl dithiocarbamale decreased the reconstituted system's sulfur-oxidizing activity. The iron and flavin in the soluble components may play an important role in the elemental iron-oxidizing system of this organism. (Buchanan-Davidson--Wisconsin).

INTERSTITIAL PROTOZOA AND ALGAE OF LOUISIANA SALT MARSHES,
Tulane Univ., New Orleans, La. Newcomb Coll.
P. B. Elliot, and S. S. Bamforth.
Journal of Protozoology, Vol. 22, No. 4, p. 514-519, 1975. 5 fig., 1 tab., 19 ref.

Descriptors: *Bottom sediments, *Salt marshes, *Algae, *Protozoa, *Louisiana, Distribution, Mud, Oxidation-reduction potential, Varieties, Anaerobic conditions, Decomposing organic matter, Hydrogen sulfide, Photosynthetic bacteria, Food chains, Migration, Omnivores, Carnivores.

Interstitial ciliate distributions were studied in Louisiana salt marshes, stagnant connecting pools with vegetation dominated by Spartina and Distichlis spicata. The sediments had a rich ciliate fauna and constituted a 'sulfide biome'. The marshes lacked an overlying oxidized zone. Water above the sediment and sediment surfaces formed a redox-potential-discontinuity layer containing oxidized and reducing compounds and Eh values reaching to -350 mV. Oxygen flow into interstices is restricted by small size of silt. Undecomposed organic matter depth depended on frequency of disturbances. The redox-potential-discontinuity layer supported algae using light from above and nutrients from below. Anaerobic decomposition produces reduced low molecular weight compounds; and inorganic endproducts like hydrogen sulfide are oxidized by thiobacteria and photosynthetic bacteria, so there were food chains to support diverse ciliate fauna. Sulfide-tolerant organisms resided in surface sediments. Migrations of Plagiocampa, Metopus, Caenomorpha, Sonderia, and Plagiophyla into sulfide-rich zones were observed. The 200 interstitial ciliate species showed definite stratification. Interstitial habitats favored unicellular organisms with flexible, flattened, or worm-like bodies. Carnivores and omnivorous species of Holosticha, Uroleptus, Blepharisma, and Tracheloraphis were restricted to the upper two sediment layers. Small bactivores with rigid pellicles and strong swimming patterns penetrated the compacted layer. (Buchanan-Davidson--Wisconsin)

PHOSPHORUS AND NITROGEN CYCLE ON A TRANSECT IN LAKE ONTARIO DURING THE INTERNATIONAL FIELD YEAR 1972-1973 (IFYGL),
Canada Centre for Inland Waters, Burlington (Ontario). Applied Limnology and Physical Processes Section.
P. Stadelmann, and A. Fraser.
International Association of Great Lakes Research, Proceedings 17th Conference Great Lakes Research, p. 92-108, 1974. 9 fig., 21 ref.

Descriptors: *Cycling nutrients, *Phosphorus, *Nitrogen, *Lake Ontario, *Spatial distribution, *Water temperature, Nitrates, Organic matter, Biomass, Thermocline, Water circulation, Stratification, Turnovers, Epilimnion, Primary productivity, Sedimentation, Path of pollutants.

Horizontal and vertical orthophosphate and nitrate distributions and their conversion to organic matter using particulate phosphorus and organic nitrogen as biomass indicators were studied in Lake Ontario samples from a transect at 78 deg W longitude during circulation, thermal bar development, summer stratification, and beginning of fall overturn. Maximum particulate organic nitrogen was 230, particulate phosphorus 20, and chlorophyll 17 micrograms/liter at 10 m in July. Phosphorus and nitrate concentrations decreased when changing from deep circulation to stratification. Recycling of nutrients in the epilimnion was about 81% of the primary production rate expressed as nitrogen uptake rate and 93% when expressed as phosphorus uptake rate; when loading data were included, percentages were reduced to 69% and 87% of the nitrogen and phosphorus uptake rates, respectively. During summer stratification sedimentation from the epilimnion was approximately 0.14 g phosphorus and 3.3 g nitrogen/sq m. During fall overturn, mixing caused total nitrogen and phosphorus concentrations to return to approximately spring circulation values. Nutrient and biomass indicators were identified in both horizontal and vertical dimensions. Midlake epilimnion biomass production depended primarily on nutrient regeneration. The results are limited to a specific transect of the lake. (Buchanan-Davidson--Wisconsin).

AN ASSESSMENT OF POSSIBLE POLLUTION EFFECTS OVER A CENTURY OF THE BENTHIC MARINE ALGAE OF CO. DURHAM, ENGLAND,
Durham Univ. (England). Dept. of Botany.
P. Edwards.

Botanical Journal of the Linnean Society, Vol. 70, No. 4, p. 269-305, 1975. 1 fig., 86 ref.

Descriptors: *Water pollution effects, *Benthic flora, *Marine algae, Phaeophyta, Shores, On-site data collections, Phodophyta, Chrysophyta, Biological communities, Varieties, Europe, Chlorophyta.
Identifiers: England, County Durham(England).

One of the most polluted British shores is in County Durham, England. Pollution effects could be studied there, because extensive herbarium algal collections were made from 1793-1864 before pollution increased dramatically. This list was revised according to modern algal systematics and surviving herbarium specimens examined. There were 145 species, although 8 were excluded because they may not have been collected in Durham and 3 because they were incorrectly identified. These were compared with the present flora of 122 species collected. A detailed list of species is presented, showing their vertical and seasonal abundance, reproduction, characteristics, and collection dates. Eighty-six species were common to both lists. Approximately 48 species were common in the earlier study and 53 now (excluding estuarine algae). The figures indicate there has been little or no reduction in common species with time and pollution. Of the 48 species found earlier, six are now absent and two rare; therefore there has only been a 16.6% reduction in common species over the past century despite increases in industrialization and urbanization. It is concluded that pollution has had only a minimal effect on species diversity on the open Durham County coast where there is good water circulation. (Buchanan-Davidson--Wisconsin)

UNDERWATER OBSERVATIONS OF GELATINOUS ZOOPLANKTON: SAMPLING PROBLEMS, FEEDING BIOLOGY, LAND BEHAVIOR,
California Univ., Davis. Dept. of Zoology.
W. M. Hamner, L. P. Madin, A. L. Alldredge, R. W. Gilmer, and P. P. Hamner.
Limnology and Oceanography, Vol. 20, No. 6, p. 907-917, 1975. 51 ref.

Descriptors: *Zooplankton, *Marine animals, *Sampling, *Animal behavior, Food habits, Food chains, Scuba diving, Tropical regions, Oceans, Predation, Jelly fish, Larvae.
Identifiers: *Gelatinous zooplankton, Hydromedusae, Siphonophora, Scyphomedusae, Ctenophora, Heterpoda, Pteropoda, Thaliceae, Appendicularia.

The avoidance behavior, feeding, and predation of the Hydromedusae, Siphonophora, Scyphomedusae, Ctenophora, Heteropoda, Pterpoda, Thalicea, Appendicularia and many meroplanktonic larve were observed (and samples collected) by SCUBA divers. Conventional plankton collection is not likely to sample these organisms accurately because of their fragility, patchy distribution, and escape responses. These relatively large organisms represent several phyla and span two or three trophic levels, but are considered an ecological group on the basis of the predator-protection strategies which they have in common. Many gelatinous plankters filter feed using mucuous structures and are efficient in collecting particulate material, and because mucus is a source of organic aggregates in the sea, their importance has been underestimated. These aggregates are often large, irregularly distributed, of complex composition, and contribute considerable spatial heterogeneity to a seemingly homogenous environment. An entire category of pelagic animals live in association with these floating substrates. Many organic aggregates (marine snow) appear to originate from the mucous secretion of gelatinous zooplankton but their fragility hampers accurate sampling by netting or from the surface. Underwater observations indicated that many 'planktonic' organisms depend heavily on the presence of discrete surfaces, both living and nonliving, in the pelagic environment. (Auen-Wisconsin)

METHODS FOR MEASUREMENT OF BIODEGRADABILITY OF CHEMICAL COMPOUNDS,
Akzo Research Lab., Arnhem (Netherlands).
J. Blok.
International Biodeterioration Bulletin, Vol. 11, No. 3, p. 78-84, 1975. 17 ref.

Descriptors: *Analytical techniques, *Measurement, *Biodegradation, *Chemicals, Activated sludge, Standards, Laboratory tests, Water analysis, Adaptation, Toxicity, Limiting factors, Biomass, Sampling, Degradation(Decomposition).

Standardization of methods for determining biodegradability is needed. Primary biodegradation is detected by specific analysis of the original molecule; environmentally acceptable degradation means that degradation products will cause no further damage or inconvenience to the environment; and ultimate degradation is complete conversion to carbon dioxide, water, and inorganic salts. Biodegradation tests should be designed so that natural or practical conditions are imitated and possible. Biodegradation occurs in water, soil, anaerobic environments, and plants-sunlight. Each major problem--adaptation, toxicity, non-biotic elimination, and analytical limitations--is discussed and recommendations made. Methods for measuring biodegradation are classified on the basis of microbiological criteria: the test substance and biomass concentrations, whether the test substance was the only carbon source, and length of adaptation period. Test methods should be done in environments that provide for adaptation so that the degradation potential will be similar to that of purification plants, fresh surface water, and soil. Besides differences in biodegradation potentials, there is no sharp separation between primary and ultimate degradation. Tests are divided into inoculated die-away and activated sludge tests; the latter came nearest to an ideal situation. Inoculated die-away tests are suitable for measuring ultimate degradation and specific analyses but are not suitable for adaptation tests. (Buchanan-Davidson--Wisconsin)

ON LONG-TERM STABILITY OF ZOOPLANKTON COMPOSITION,
Uppsala Univ. (Sweden). Inst. of Limnology.
B. Pejler.
In: Report No. 54, Institute of Freshwater Research, p. 107-117, 1975. 14 tab., 34 ref.

Descriptors: *History, *Zooplankton, *Data collections, *Lakes, Sampling, Plankton nets, Varieties, Oligotrophy, Eutrophication, Bioindicators.
Identifiers: *Sweden.

Data were collected from central Swedish lakes in which relatively comprehensive studies had been made in different decades. The author's records, literature reports, and archived material were used. There were large variations in collection methods, especially net mesh size, sampling frequency and location, and seasons. Species found in each lake, year reported, and frequencies are presented. Some species (Bosima coregoni and Leptodora kindti) were found in all types of lakes studied. Holopedium gibberum, an indicator of oligotrophic conditions, was frequently found before 1921, but has not been found recently. Daphnia cucullata, an indicator of eutrophy, was only found in some lakes after 1921. Bosmina longirostris, Chydorus sphaericus, and Ceriodaphnia also increased with eutrophication. Bosmina coregoni was not present in the six most eutrophic lakes; in one lake it seemed as if it had been replaced by B. longirostris. Species indicating oligotrophy are usually larger than those indicating eutrophy. Dispersal barriers seemed to play an important role for Eudiaptomus and Eurytemora. Lowered water levels caused true limnoplankters to disappear. There was a high degree of similarity in the earlier and present studies, indicating stability of zooplankton composition; most changes appeared to be short-term rather than long-term. (Buchanan-Davidson--Wisconsin)

Identifiers: Compartment models, Model limitations, Subcompartment models, Component modeling, Model application.

Ecosystems are systems of living organisms in a physical and chemical environment which have developed and adapted over long periods of time. They present unique problems for quantitative description and prediction. Mathematical models can be used to analyze these systems subject to many limitations. All models are less than perfect and their evaluations should be based on characteristics related to their proposed use. (Katz)

FFECTS OF DISCHARGE FROM A DREDGE POILS SITE ON CARROLL ISLAND, MARY-AND,
dgewood Arsenal, Aberdeen Proving Ground, d. Biomedical Lab.
G. Pearson, and E. S. Bender.
vailable from the National Technical Informa-on Service, Springfield, Va., 22161, as ADA012 6, $3.50 in paper copy, $2.25 in microfiche. echnical Report EB-TR-75030, June, 1975. 21 p., tab., 7 fig., 8 ref.

escriptors: Benthos, *Maryland, *Estuaries, cosystems, Biological communities, *Dredging, Spoil banks, *Bottom sampling, *Benthic fauna, lams, Annelids, *Crustacea, Storm runoff, Tropical cyclones, *Hurricanes, *Chesapeake ay, Invertebrates, Path of pollutants, Waste sposal.
lentifiers: Carroll Island(Md), Tropical Storm gnes, Rangia cuneata, Leptocheirus plumulosus, colecolepides, Dredge spoils, Dredge spoils ru-off.

enthic sampling of macroinvertebrate popula-ons was conducted 14 times from April to August 972 to determine the effects of a discharge from a redge spoils site on Carroll Island, Maryland, on e upper western shore of the Chesapeake Bay. uring the sampling period, 8.78 inches of rain fell n the study area from 21 to 23 June 1972 during opical storm Agnes. Nine samples were collected rior to Agnes and five were taken after the storm. wenty-two species (20 invertebrates and 2 ver-brates) were collected; 81.5% of the sample was epresented by three species: the brackish-water am, Rangia cuneata; the amphipod, Lep-ocheirus plumulosus; and the polychaete, colecolepides viridis. The number of small R. cu-eata (1.3 to 4.3 mm) increased significantly after ie storm, indicating that there was an influx of ju-enile clams. Despite the extreme temporary ydrologic occurrences caused by the tropical orm, most changes in the number of individuals nd species could be attributed to the effects of ie dredge spoils discharge on Station 3 and easonal changes in the species abundance during ie study period. In high siltation, L. plumulosus opulations declined, whereas S. viridis popula-ons remained relatively constant. Possible excep-ons are the freshwater snail, Hydrobia sp., which as found commonly after the storm but was col-cted only once before the storm; and Corophium acustre and Edotea triloba, which decreased in bundance after the stom, apparently being ashed down estuary. IICROBIAL DEGRADATION OF MODEL ETROLEUM AT LOW TEMPERATURES,
Iaryland Univ., College Park. Dept. of licrobiology.
D. Walker, and R. R. Colwell.
vailable from the National Technical Informa-on Service, Springfield, Va., 22161, as Ada009 58, $4.00 in paper copy, $2.25 in microfiche. licrobial Ecology, Vol. 1, p. 63-95. 1974. 16 fig., 8 ib., 18 ref.

escriptors: *Oily water, Oil, *Oil spills, Chesapeake Bay, *Microbial degradation, Marine bacteria, *Aquatic fungi, *Water tem-erature, Oil pollution, Oil-water interface, Or-anic wastes, Inlets(Waterways), Aquatic icrobiology, Biological treatment, Microorgan-ms, Marine fungi, Methodology, Pseudomonas, Vater pollution effects.
lentifiers: Petroleum degrading microorganisms, ibrio aeromonas, Acinetobacter, Hydrocarbons, lkanes, Baltimore Harbor, Branched alkanes, yclic alkanes, Aromatics, Polynuclear aromatics.

wo areas of Chesapeake Bay are presently under tudy, with routine sampling of water and sedi-ent for petroleum-degrading microorganisms acteria, yeasts, and fungi). Selected physical and hemical parameters are recorded for each sam-pling site, and water and sediment samples are extracted for hydrocarbons. Numbers of petroleum-degrading microorganisms enumerated by direct plating were found to correlate with the concentration of benzene-extractable material and were higher for the Colgate Creek than for the Eastern Bay site. Petroleum-degrading microorganisms were isolated from water and sediment samples at environmental temperatures of 0 degrees, 5 degrees and 10 degrees C. Higher growth yields and maximum hydrocarbon degradation were observed for microorganisms in a salts medium at 0 degree, 5 degree, and 10 degree C, although significant quantities of hydrocarbons were utilized in some samples grown in a medium for which Chesapeake Bay water was the diluet. Bacterial hydrocarbon degradation accounted for most of the model petroleum utilization at 0 degree and 5 degree C. However, oscillations of bacterial populations, with significant growth of yeasts, were observed at 10 degree C. Photomicroscopy and scanning electron microscopy revealed aggregates of bacteria, yeasts, and fungi associated with oil globules. From preliminary identification and classification of the hydrocarbon-utilizing bacteria, members of the genera Vibrio, Aeromonas, Pseudomonas and Acinetobacter were present in the enrichment cultures. From results of this study, it is concluded that utilization of model petroleum at low temperatures is a function of the types and numbers of microorganisms present in an original inoculum taken from the natural environment. PATHOLOGY OF ACUTE POISONING WITH THE INSECTICIDE SEVIN IN THE BENT-NOSED CLAM, MACOMA NASUTA,
Oregon State Univ., Newport. Marine Science Center.
D. A. Armstrong, and R. E. Millemann.
Available from the National Technical Information Service, Springfield, Va., 22161, as COM-75 10546, $3.50 in paper copy, $2.25 in microfiche. Journal of Invertebrate Pathology, Vol. 24, p. 201-212, 1974. 13 fig., 18 ref.

Descriptors: *Toxicity, *Insecticides, *Poisons, *Clams, Mollusks, Shellfish, Histology, Necrosis, Tissues(Biology), Cells(Biology), Animal pathology, *Fish diseases, Water pollution effects.
Identifiers: *Toxicity tests, *Sevin, Bent-nosed clams, Macoma nasuta, Cell damage.

Toxicity tests of 96-hr duration of the insecticide Sevin were done with adult bent-nosed clams, Macoma nasuta. Sevin concentrations of 15, 20, 25, and 30 mg/liter were used in duplicate tests. The criterion of 'death' was the inability of clams to retract siphons or to close valves. About half of the animals so affected were removed from the test solutions and returned to clean sea water to observe if recovery occurred, and others were preserved for histological examination. No 'dead' clams recovered within 96 hr after return to clean water. The histopathology consisted primarily of necrosis of epithelial tissue of the gill, mantle, siphon, and suprabranchial gland, and the severity of damage was directly related to the test concentrations. Vacuolization, rupture, and pycnosis of cells occurred. The gills were the most severely affected organs. Epithelial cells of the gill filaments bearing the frontal, latero-frontal, and lateral cilia were sloughed as early as 24 hr after the beginning of exposure to Sevin. About 50% if the exposed clams had lost one or both siphons and also the epithelia on still attached segments within 96 hr of exposure. There were no deaths of control clams, and their tissues were normal. (Katz)

SPECIES COMPOSITION AND DIVERSITY OF POLYCHAETES IN THE NEW YORK BIGHT,
Pacific Northwest Environmental Research Lab., Newport, Oreg. Marine Science Center.
J. R. Frey.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-241 191, $3.50 in paper copy, $2.25 in microfiche. EPA Report , Septmber, 1973. 17 p. 5 fig., 2 tab., 9 ref.

Descriptors: *Waste disposal, *Benthic fauna, Marine animals, *On-site investigations, *Benthos, Methodology, Annelids, Biota, New York, Atlantic Ocean, Continental shelf, Sea water, *Bioindicators.
Identifiers: *New York Bight, *Polychaetes, Indicator species, Bamboo worms, Maldanidae, Oweniidae, Faunal homogeneity indices.

This study is part of a larger investigation of the biological consequences of waste disposal in the New York Bight. Polychaetes from the samples of three cruises (December, 1972; February and May, 1973) in the Bight were identified. 'Bamboo worms' (families Maldanidae and Oweniidae) were the most abundant and ubiquitous polychaetes and would therefore be the best indicator species to monitor pollution in the area. No temporal changes in the densities of polychaete populations were evident, but summer and fall collections must be analyzed to complete the seasonal distribution. It is suggested that there is an optimal sediment size for polychaetes, above and below which the populations decrease. Faunal homogeneity indices for all pairs of samples were computed and plotted, giving a bimodal distribution. It is likely that the left peak of this graph is due to two aberrant samples, without which the data would be normally distributed. A normal distribution indicates an intergrading of polychaete species rather than the distinct communities indicated by a bimodal distribution. (Katz)

SUBSTITUTE CHEMICAL PROGRAM - INITIAL SCIENTIFIC AND MINIECONOMIC REVIEW OF CAPTAN.
Midwest Research Inst. Kansas City, Mo.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-242 559, $7.50 in paper copy, $2.25 in microfiche. Report EPA-540/1-75-012, April, 1975. 173 p, 30 tab, 75 ref.

Descriptors: *Toxicity, Fish, Laboratory animals, Domestic animals, *Bioassays, *Pathology, Water quality, *Minnows, *Salmonids, *Pesticides, Agronomic crops, Environmental effects, Physiological effects, Reviews, Economics.
Identifiers: Thalidomide, *Captan, *Histopathological observations, *Captan metabolites, Rabbits, Hamsters, Teratogenic activity, Mutagenic activity, Reconstituted water, EBDC fungicides, Ethylenebisdithiocarbamate, Public Law 93-135.

This is the 5th in a series of in-depth scientific literature searches which review the safety and efficacy of substitute chemicals registered by EPA as possible replacements for cancelled or suspended pesticides or pesticides in litigation. The review covers all uses of captan and is intended to be adaptable to future needs. Should captan be identified as a substitute for a problem pesticide other than ethylenebisdithiocarbamate (EBDC), as is now the case for certain uses of these fungicides, the review can be updated. The data contained in this report was not intended to be complete in all areas. Data-searches ended in January, 1975. (Katz)

ENVIRONMENTAL RESPONSES TO THERMAL DISCHARGES FROM THE CHESTERFIELD STATION, JAMES RIVER, VIRGINIA,
Johns Hopkins Univ., Baltimore, Md. Dept. of Geography and Environmental Engineering.
L. D. Jensen.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-241 671, $7.50 in paper copy, $2.25 in microfiche. Report

No. 13, December, 1974. 180 p, 50 fig, 50 tab, 195 ref. EPRI Project RP-49.

Descriptors: *Cooling water, Effluents, *Virginia, Plankton, *Phytoplankton, Water quality, *Primary productivity, *Zooplankton, Benthos, Benthic fauna, Animal groupings, Statistical analysis, Water chemistry, Water temperature, Sewage, *Thermal pollution, Water pollution effects, Entrainment, *Dissolved oxygen.
Identifiers: *James River(Va), Diversity Indices, Chesterfield Power Station(Va).

A study was made of the temperature and dissolved oxygen in the James River, Virginia, for more than 25 sampling stations, starting above the city of Richmond and extending to Hopewell. Fisheries data have been collected from the same stations on adult and juvenile fishes of both resident and transient species, and in the vicinity of the Chesterfield power station, on the benthic invertebrates. Planktonic investigations have involved population and diversity studies in the main river and Farrer Gut, and have been augmented by entrainment studies on the effect of passing microscopic organisms through the condenser system of the power station. In conclusion, the James River in the Chesterfield area seems to support a large, diversified population structure in the fisheries aspect. The impact of the city of Richmond appears to be the major factor in determining the nature and health of the fishes in the area; and the operation of the Chesterfield Power Station has a seasonal impact that does not appear to be much more than an alteration of the patterns of normal distribution. There is evidence of spawning, growth and development of many species of fish. (Katz)

Identifiers: *Aufwuchs, Angiospore, Leopard Frog, South African Clawed Toad, Hydrogen chloride, Hydrogen fluoride, RJ 4, RJ5, JP 4, N phenyl-a-naphthylamine, p,p' dioctyldiphenylamine, Octyl-phenyl-a-napthylamine, Teratogenesis, Ornamental plants.

This report for the period from February 1 to June 15, 1974, contains the results of research efforts of 4 projects concerned with defining the environmental effects of potential environmental contamination resulting from the use of certain Air Force materials. The 4 projects use different organisms as means of assessing effects. Project I uses the higher plants, the gymnosperms and angiosperms. Project II uses fish and aufwuchs. Project III utilizes unicellular algae and Project IV uses the eggs, embryo and larvae of the leopard frog. Materials being evaluated include hydrogen chloride, hydrogen fluoride, RJ 4, RJ 5, JP 4, N phenyl-a-naphthylamie, p,p' dioctyldiphenylamine, octyl-phenyl-a-napthylamine. Techniques for exposing organisms to these substances are discussed and the results of such exposures are presented. (Katz)

GENERATION TIME, LENGTH OF LIFE, INSTAR DURATION AND FREQUENCY OF MOULTING, AND THEIR RELATIONSHIP TO TEMPERATURE IN EIGHT SPECIES OF CLADOCERA FROM THE RIVER THAMES, READING,
Reading Univ. (England). Dept. of Zoology.
H. H. Bottrell.
Oecologia (Berl.), Vol. 19, p 129-140, 1975, 9 tab, 31 ref.

Descriptors: *Environmental effects, *Growth stages, Juvenile growth stage, Mature growth stage, *Crustaceans, *Temperature, Eggs.
Identifiers: *River Thames(England).

Generation time, length of life, instar duration and moulting frequency of 8 species of epiphytic Cladocera were found to be inversely related to temperature. Numbers of juvenile instars varied between species with larger species tending to have more juvenile instars than smaller species. The number remained constant for a particular species. The size relationship was also found to hold for generation time. Except at low temperatures, adult instar duration was the same as egg development duration. Juveniles moulted more often than adults. Regression analysis of the relationships between the various dependent variables and temperature required a logarithmic transformation. (Chilton-ORNL)

THE RELATIONSHIP BETWEEN TEMPERATURE AND DURATION OF EGG DEVELOPMENT IN SOME EPIPHYTIC CLADOCERA AND COPEPODA FROM THE RIVER THAMES, READING, WITH A DISCUSSION OF TEMPERATURE FUNCTIONS,
Reading Univ. (England). Dept. of Zoology.
H. H. Bottrell.
Oecologia (Berl), Vol. 18, p 63-84, 1975, 4 fig, 13 tab, 59 ref.

Descriptors: Environmental effects, *Growth rates, Mathematical models, Growth stages, *Eggs, *Crustaceans, *Copepods, *Temperature.
Identifiers: *River Thames(England).

Duration of egg development at 5, 10, 15, and 20 degrees C for 8 Cladoceran and one cyclopoid copepod was investigated. Development time was inversely related to temperature; decreased temperature caused a marked increase in development time. Cladoceran eggs tended to take longer for development than copepod eggs; epiphytic species took longer than planktonic species, and the eggs of larger species took longer than smaller species. A curvilinear logarithmic model of the relationship between rate of egg development and temperature was found to be a more generally applicable model than a linear model. (Chilton-ORNL)

EFFECTS OF SHOCK TEMPERATURE ON BIOLOGICAL SYSTEMS,
Michigan Technological Univ., Houghton. Dept. of Civil Engineering.
J. L. Carter, and W. F. Barry.
Journal of the Environmental Engineering Division, American Society of Civil Engineers, Vol. 101, No. EE2,p 229-243, April 1975. 8 fig, 2 tab, 24 ref.

Descriptors: *Environmental effects, *Thermal pollution, *Thermal stress, Bacteria, Chemical oxygen demand, Biochemical oxygen demand, Oxygen, Temperature, Water pollution effects, Activated sludge, Waste water treatment.

The solubility of oxygen and/or the bacterial activity in activated sludge systems may be affected as a result of sudden shifts in temperature. An increase in temperature may result in a lower saturation of oxygen. Reduction of oxygen transfer can result in poor treatment. Bacterial activity may be affected even if sufficient oxygen is present. Experimental data showed that uptake rates/gram of Mixed Liquor Volatile Suspended Solids (MLVSS) were equal at 35 - 50 degrees C but the total amount of oxygen required per gram of MLVSS at 50 degrees C was four times that required at 35 degrees C to achieve removal of soluble COD. The rate of initial soluble COD removal/gm MLVSS was six times greater at 15 degrees C than at 50 degrees C. More solids were produced per gram of soluble COD removed at 35 degrees C than at 50 degrees C. A BOD removal of 95% was achieved at 35 to 50 degrees C. (Chilton-ORNL)

ACID-IRON WASTE AS A FACTOR AFFECTING THE DISTRIBUTION AND ABUNDANCE OF ZOOPLANKTON IN THE NEW YORK BIGHT: I. LABORATORY STUDIES ON THE EFFECTS OF ACID WASTE ON COPEPODS,
Harvard Univ., Cambridge, Mass. Biological Labs.
G. D. Grice, P. H. Wiebe, and E. Hoagland.
Estuarine Coastal Mar Sci. 1(1), p 45-50, 1973.

Descriptors: *Industrial wastes, *Acidic water, New York, Iron, *Zooplankton, Copepods, Mortality, Plankton, Toxicity, Sea water.

entifiers: New York Bight, Calanus-Finarchicus, PseudocalanuseSp., Temora-Longicors.

dividuals of Calanus finmarchicus, Temora loncornis and Pseudocalanus sp. were maintained in ttles containing varying dilutions of acid wastes sea water or control sea water solutions for 24 to h to examine survival of adults exposed to high ncentrations of waste. They were also mainined for time periods up to 18 days to ascertain fects on reproduction and survival of young. Inviduals of C. finmarchicus were transferred rough a series of increasing dilutions of acid astes and into filtered sea water to simulate the ort-term effects of acid waste concentrations in e wake of a discharging barge. Substantial morlity of adults of the above 3 copepods occurred concentrations of acid waste producing pH of proximately 6.5 and lower. This is not indicative mortality in the field as these concentrations d pH values exist for only a short time (less than min) due to rapid mixing of the acid waste with a water. Individuals maintained in buffered acid astes of comparable dilutions showed no mortali, while individuals maintained in test media ing sulfuric acid in place of acid waste showed gh mortalities at pH of 5.5 or less. Acidity of test lutions may be a principal cause of copepod ortality rather than some toxic component of the aste material. Inhibition of reproduction and leterious effects on survival of young were obrved in experiments of 18 days duration at conntrations of acid wastes which do not in fact perst for such periods on the acid grounds. No mortlity was observed when C. finmarchicus was ansferred through acid waste dilutions which ith pH values and time periods comparable to ose they would encounter on the acid grounds uring discharge of acid wastes. Acid waste scharges, were not responsible for the large riations in zooplankton biomass previously obrved in the survey area since mortality of spees due to short term exposure to high concentraons of waste appears small and little effect on dults or larval forms at great dilutions could be emonstrated.(See also N75-04574) Copyright 975, Biological Abstracts, Inc.

Identifiers: Amoebas, *Training manuals, Plankton identification.

This course is designed for professional personnel in the fields of water pollution control, limnology, and water supply. Topics covered are: Plankton limnology and ecology; biology of zooplankton communities; optics and the microscope; cell structure and function; algal types--blue-green, green, and pigmented flagellates; filamentous and coccoid green algae; diatoms; filamentous bacteria; fungi and 'sewage fungus'; protozoa; nematodes; rotifers; free-living amoebae; and animal plankton. Laboratory methods for diatom and animal plankton identification; preparation and enumeration; fundamentals, calibration, and use of plankton counting equipment; determination of odors and plankton productivity; proportional plankton counting; algal growth potential test; and algae and actinomycetes in water supplies are described. Guidance is given to use of algae as pollution indicators; odor production by algae and other organisms; plankton in oligotrophic lakes; effects of pollution on lakes; application of biological data; problem of synthetic organic wastes; significance of limiting factors for population variation; nutrients; algae and cultural eutrophication; algal control; control of interference organisms in water supplies; and case preparation and courtroom procedures. Keys to selected groups of freshwater animals and algae important in water pollution and a classification-finder are also included. (Buchanan-Davidson--Wisconsin)

IS THE EXAMINATION OF DRINKABLE WATER AND SWIMMING POOLS ON PRESENCE OF ENTEROPATHOGENIC E. COLI NECESSARY, (IN GERMAN),
Mikrobiologie Institut Medical Fakulteti, Ljubljana (Yugoslavia).
A. Z. Dragas, and M. Tratnik.
Zentralbl Bakteriol Parasitenkd Infektionskr Hyg Erste Abt Orig Reihe B Hyg Praev Med. 160(1), p 60-64, 1975.

Descriptors: Potable water, E. coli, Enteric bacteria, Water analysis, Enteric bacteria, Swimming pools, Human diseases, Public health, Pollutant identification.

The examination of 1950 different water samples showed that 21.5% of them were micro-biologically unsafe and had a high MPN (most probable number) of E. coli; 2.3% of these strains belonged to enteropathogenic groups. The percentage depended on the character of water establishment, and was in small water supplies as high as 8%; in swimming pools, 11%. The following OK groups of enteropathogenic E. coli were identified: O25:K11, O28:K73, O55:K59, O78:K80,O115, O126:K71, O146, all known causes of acute enteric diseases of children and adults. During outbreaks or other epidemiological events, it is useful to examine the E. coli strains isolated from different water samples serologically, in order to eventually identify them as enteropathogenic.--Copyright 1975, Biological Abstracts, Inc.

SEDIMENTATION AND PHOSPHORUS BALANCE IN LAKE LUCERNE (HORW BAY) AND IN THE ROTSEE, (IN GERMAN),
Eidgenoessische Anstalt fuer Wasserversorgung, Abwasserreinigung und Gewaesserschutz, Zurich (Switzerland).
J. Bloesch.
Schweiz Z Hydrol. 36(1), p 71-186, 1974.

Descriptors: *Lake sediments, Lakes, *Phosphorus, Mesotrophy, Phytoplankton, *Eutrophication, Europe, Chemical analysis, Nutrients, Biomass, Nitrogen, *Cycling nutrients, *Nutrient requirements, Primary productivity.
Identifiers: *Rotsee(Switzerland), *Lake Lucerne(Switzerland).

In 1960/70, chemical and physical parameters, phytoplankton and recent sedimentation at different levels were investigated in the mesotrophic Lake of Lucerne (Horw Bay) and in the highly eutrophic Rotsee (Switzerland). The rates of sedimentation were 1277.4 g dry matter/m2. yr in Horw Bay and 879.3 g dry matter/m2. yr in the Rotsee. The chemical analysis of sediments included the following components: total organic substance (loss on ignition), organic C, clay minerals (HCl-insoluble fraction), Ca, Mg, P, N, Fe and Mn. The Rotsee is distinguished by higher nutrient concentrations, higher rates of sedimentation (exceptions: clay minerals, Fe and, to a certain extent, N and Mn) and by a greater biomass of phytoplankton. The distribution and succession of selected species and groups of phytoplankton are discussed, the velocity of sinking, the degradation, the growth dynamics and the measure of trophic state are calculated. For both sakes, a P and a N balance were drawn up. The N:P ratio continually decreases through the nutrient cycle from the input to storage in the bottom sediments. The intrabiocoenotic P cycle in the epilimnion is very intensive and supplies approximately 2/3 of the nutrient requirements for primary production in both Horw Bay and the Rotsee.--Copyright 1975, Biological Abstracts, Inc.

ROTIFER PRODUCTION IN LAKE BAIKAL, (IN RUSSIAN),
Biologo-Geograficheskii Nauchno-Issledovatelskii Institut, Irkutsk (USSR).
G. L. Vasil'eva, and V. L. Nikulin.
Zool Zh. 53(8), p 1125-1132, 1974.

Descriptors: *Rotifers, Asia, *Biomass, *Plankton, *Production, Littoral, Lakes, Growth rates.
Identifiers: Filinia-Terminalis, Kellicottia-Longispina, Keratella-Cochlearis, Keratella-Quadrata, Notholca-Grandis, Notholca-Intermedia, Synchaeta-Grandis, Synchaeta-Pachypoda, Synchaeta-Stylata, *Lake Baikal(USSR).

Population density, biomass and production were studied in planktonic rotifers of Lake Baikal: Synchaeta pachypoda, S. stylata, S. grandis, Notholca grandis, N. intermedia, Kellicottia longispina, Keratella cochlearis, K. quadrata, Filinia terminalis. Material were collected near the Baikal Biological Station of the Irkutsk State University in the pelagic zone for 1 yr and in the littoral zone for nearly 3 yr. Production was studied by the Edmondson's method (1960). The yearly G/W (growth/weight) coefficient of rotifers-filtrators in the pelagic zone was 45, in the littoral zone-49, that of predators in the pelagic zone-14 and in the littoral zone-13. The average daily G/W coefficient of different species varied from 0.001-0.2 during the year.--Copyright 1975, Biological Abstracts, Inc.
W76-09791

HYGIENIC ASSESSMENT OF CHANGES IN MINERAL WATER PROPERTIES DURING ITS TREATMENT FOR USE IN INTERNAL BAL-

NEOTHERAPEUTIC PROCEDURES, (IN RUSSIAN),
Stavropol Territorial Medical Inst. (USSR).
P. I. Filippov.
Gig Sanit. 38(2), p 95-96, 1973.

Descriptors: *Bacteria, *Mineral water, Thermal water, *Water treatment, *Coliforms, Enteric bacteria, Public health, *Shigella.
Identifiers: *Enterococci, *Proteus, Therapeutic mineral waters, Balneotherapy(Human).

Delivery, conditioning and tapping of nonpotable mineral water intended for internal use in balneological therapy (enema) caused deterioration of the water with regard to bacteriological, chemical, sanitary and therapeutic properties. A low coliform titer, and the presence of enterococci, Proteus and Shigella were observed. The proliferation of bacteria was due to the high temperature of the mineral water, sometimes exceeding 40C.--Copyright 1975, Biological Abstracts, Inc.
W76-09795

HYGIENIC STANDARDIZATION OF TIN DIBUTYL DIISOOCTYLTHIOGLYCOLATE IN WATER BODIES, (IN RUSSIAN),
Moskovskii Gosudarstvennyi Meditsinskii Institut (I) (USSR).
A. S. Igumnov.
Gig Sanit. 2, p 13-17, 1975.

Descriptors: Public health, Water bodies, Organic compounds, Organoleptic properties, *Toxicity, *Pollutant identification.
Identifiers: Guinea pigs, Rabbits, Rats, *Tin dibutyl diisooctylthioglycolate.

Tin dibutyl diisooctylthioglycolate (TDDIOG) is highly toxic in rats, guinea pigs and rabbits and possesses pronounced cumulative properties. The threshold concentration of this substance according to the organoleptic index and its effect on the sanitary regimen of water bodies were found to be at a level of 0.05 and 0.5 mg/l. The ineffective dose of TDDIOG in a chronic sanitary toxicologic experiment amounted to 0.0004 mg/kg, which equaled its concentration in the water at a level of 0.01 mg/l. This concentration is suggested as its maximum permissible for water bodies.--Copyright 1975, Biological Abstracts, Inc.
W76-09797

AN OBSERVATION OF WATER QUALITY AND RED WATER IN STILL WATER FISH PONDS, (IN KOREAN),
Pusan Fisheries Coll. (Republic of Korea).
I. B. Kim, and M. J. Park.
Bull Korean Fish Soc. 7(2), p 69-78, 1974.

Descriptors: Water quality, *Phytoplankton, Ponds, Fish hatcheries, Asia, *Eutrophication, *Cyanophyta, *Chlorophyta, Temperature, *Dissolved oxygen, Zooplankton, Oxygen.
Identifiers: *Korea, Synechocystis-Aquatilis, *Fish ponds, *Red water.

A study of the dissolved O2 and phytoplankton in the pond water was carried out to determine the water quality and to investigate the cause of red water in fish ponds at Pusan Fisheries College (Korea) in 1972-1973. Measured O2 content during the period from Aug. 6-7, 1972 and was 23.95 ppm (328% of saturation) in daytime and 0.39 ppm (5%) in the early morning in water containing a heavy bloom of phytoplankton; in clear water the range of O2 content was 8.72-6.58 ppm. The occurrences of red water in 1972-1973 were always caused by the sudden death of Synechocystis aquatilis (Cyanophyta) when the water temperature was very high (30-33.5C). High mortality of the fish being reared followed. The phytoplankton observed included 133 spp. belonging to 55 genera in 23 families. Chlorophyta was dominant in number of specis; Cyanophyta in quantity. The zooplankton observed included 12 spp. belonging to 11 genera in 11 families.--Copyright 1975, Biological Abstracts, Inc.
W76-09799

ON THE EXTERMINATION OF POLYCLADS: CALCIUM HYPOCHLORITE (CAOC12) TREATMENT IN THE PERIOD OF HIGH WATER TEMPERATURE, (IN KOREAN),
H. C. Yang.
Bull Korean Fish Soc. 7(3), p 121-125, 1974.

Descriptors: *Water temperature, *Oysters, *Lethal limit, Calcium compounds, *Water treatment.
Identifiers: *Polyclads, Pseudostylochus-Obscurus, Stylochus-Ijimai, *Calcium hypochlorite.

Polyclads (Stoylochus ijimai and Pseudostylochus obscurus) which damage oysters were treated with CaOCl2 to determine the TLm (mean lethal treatment) concentration. The TLm and the extermination density as well as the growth of the oyster after treatment were checked. The higher the temperature and the longer the period of treatment, the lower the TLm. The greater the concentration of sea water, the higher the TLm, because of the weakened action of CaOCl2. When the oyster is treated with CaOCl2 at the oyster farm, its extermination concentration is 2.4-7.1 times higher than the TLm in freshwater. The growth rate was not affected after the treatment.--Copyright 1975, Biological Abstracts, Inc.

THE MERCURY CONTENT OF INDUSTRIAL FISH PRODUCTS: ITS RELATIVE VARIATION WITH THE TREATMENT (COOKING IN SALT WATER, PICKLING AND FISH PRODUCTION), (IN SPANISH),
Instituto Espanol de Oceanografie, Madrid (Spain).
A. Arevalo, J. Aravio-Torre, C. Masso, and C. G. Fernandez.
Bol Inst Esp Oceanogr. 179, p 1-16, 1974.

Descriptors: *Mercury, *Preservation, Fish, *Commercial fish, Fish diets, Water treatment, Production, Industrial wastes.
Identifiers: Pickling, *Fish products, Fish meal, Tuna.

Commercially preserved fish products have a Hg content different from that of the raw fish, but this variation is only relative since none of the treatment processes eliminates Hg. Generally, as water is lost in cooking, and as more NaCl, acetic acid or oil is incorporated in brining, the 'relative' Hg content increases, although the increase depends on the treatment and the fish species. These variations are of little significance. In the production of fish meal, the variation in Hg content is appreciable. Tuna meals normally contain 1.40 ppm Hg but may attain higher values depending on origin of the fish, age and size. If, in the manufacture of this meal, it were possible to dry it at 175 C (in spite of the slight charring that would occur) the Hg content would drop, not relatively but absolutely. Instead of fixing an upper concentration limit for Hg in fish products, it may be more logical to inform the public how much of the product they can eat daily. The Swedes are pioneers with this idea; their expert committee established the concept of the daily permissible diet.--Copyright 1975, Biological Abstracts, Inc.
W76-09802

STUDY OF THE EFFECT OF IRON ON THE HUMAN BODY AND LIVING CONDITIONS, (IN RUSSIAN),
G. P. Zarubin, and I. K. Lysogorova.
Gig Sanit. 2, p 20-23, 1975.

Descriptors: *Iron, Water pollution effects, *Human diseases, Potable water, Public health.
Identifiers: Erythrocyte, Leukocyte, Pruritis, Skin diseases(Human).

A study of persons using water containing Fe levels of 1-5 mg/l revealed undesirable effects in 62-100% of the cases. Water with Fe content of 4-5 mg/l caused skin problems (dryness, desquamation, pruritis). A high Fe content in drinking water did not affect Hb erythrocyte of leukocyte content.--Copyright 1975, Biological Abstracts, Inc.

EFFECT OF HEATED WATER DISCHARGE OF THERMAL AND NUCLEAR POWER PLANTS ON INVERTEBRATES OF COOLING PONDS, (IN RUSSIAN),
Akademiya Nauk URSR, Kiev. Instytut Hidrobiologii.
L. A. Kititsina.
Gidrobiol Zh. 9(5), p 104-120, 1973.

Descriptors: *Thermal pollution, *Heated water, *Invertebrates, *Cooling ponds, Thermal powerplants, Algae, Bacteria, Nuclear powerplants, Europe, Production, Protozoa, Fish, Water pollution effects.
Identifiers: Bulgaria, England, France, Hungary, Poland, Scotland, USSR, United States.

A review of the literature is given elucidating investigations conducted in the USSR, Poland, Bulgaria, Hungary, England, Scotland (United Kingdom), France and the USA on the effect of heated water discharges of thermal and nuclear power plants on the quantitative development of fauna. The biology and production of the invertebrates of cooling ponds and the accumulation of metals and radioactive substances in aquatic organisms in the heating zone are considered. It is important to know the possible reaction of the aquatic biota of a specific pond to heating of the water. This necessitates further study of the effect of heat on the ecology, physiology, production and behavior of the aquatic biota, including bacteria, protozoa, algae and fish.--Copyright 1975, Biological Abstracts, Inc.

THE ALGAL POPULATION OF DUEMMER LAKE IN THE YEARS 1970/71, (IN GERMAN),
Niedersaechsische Landesinstitut Marschen und Wurtenforsch., Wilhelmshaven (West Germany).
K. Behre.
Ber Naturhist Ges Hannover. 118, p 163-190, 1974.

Descriptors: *Plankton, *Algae, *Bacteria, Cyanophyta, Diatoms, Chrysophyta, Lakes, Production, *Eutrophication, Degradation(Decomposition).
Identifiers: Bacteriophyta, Chlorococcales, Conjugatae, Duemmer, *Germany, Heterocontae, Ulotrichales, Zooflagellata, Steinhuder Lake(West Germany), *Duemmer Lake(West Germany).

The numerous species found during monthly studies from May 1970-Sept. 1971 show that this is a very eutrophic sea. Plankton density was much greater than in the otherwise comparable Steinhuder Lake (West Germany), and the plankton was very uniform, indicating even water distribution. Numerous Bacteriophyta, Cyanophyta, Zooflagellata, Chrysophyta, Heterocontae, Ulotrichales, Conjugatae and Diatomeae were found. Maximum production occurred in late summer and the minimum occurred in winter. From Jan.-April, Diatomeae predominated, followed by Chlorococcales, Cyanophyta and Chlorococcales again. In the littoral reed-filled areas, 439 forms of plankton were found but the algal population was not as uniform. The algal population was eliminated totally during the warmer summer months along the shore due to the decomposition activity of bacteria.--Copyright 1975, Biological Abstracts, Inc.

ANTHROPOGENIC EFFECT ON CONTINENTAL, MARINE, AND OCEANIC BIOHYDROCOENOSES, (IN RUSSIAN),
N. K. Deksbakh.
Gidrobiol Zh. 9(4), p 111-117, 1973.

Descriptors: *Reviews, Urbanization, Technology, *Hydrobiology, Oil pollution, Reservoirs, Lakes, Industrial wastes, Effluents, Rivers, Streams, Equilibrium, Hydrologic aspects.
Identifiers: *Anthropogenic effects, *Biohydrocenoses.

The athropogenic effect is a result of the technological revolution and universal urbanization which in recent times has affected biohydrocoenoses with increasing intensity. A review of the literature on man's effect on continental biohydrocoenoses (reservoirs, lakes, river, canals, ponds, streams) and marine and oceanic biohydrocoenoses via pollution by oil and industrial effluents is presented. The anthropogenic effect changes the nature of the planet and leads to disturbance of the dynamic equilibrium in biohydrocoenoses and sometimes to their destruction.--Copyright 1975, Biological Abstracts, Inc.

COMPARATIVE EFFECTS OF DIQUAT PLUS COPPER SULFATE ON AQUATIC ORGANISMS,
Florida State Game and Fresh Water Fish Commission, Eustis. Eustis Fisheries Research Lab.
B. E. May, R. S. Hestand, and J. M. VanDyke.
Weed Sci. Vol. No. 21(3), p 249-253, 1973.

Descriptors: *Herbicides, *Diquat, Copper sulphate, Fish, Aquatic animals, Toxicity.
Identifiers: Hydrilla-verticillata, TAC, CSP.

Effects of herbicide combinations on aquatic invertebrates were evaluated in Inglis Reservoir, which is located in west coastal Florida. The addition of 6,7-dihydrodipyrido (1,2-a: 2'1' - c)pyrazinediium ion (diquat) plus the triethanolamine complex of copper sulfate (TAC) and diquat plus copper sulfate pentahydrate (CSP) for control of hydrilla (Hydrilla verticillata Casp.) decreased the number of invertebrates inhabitating the treated areas. The diquat plus CSP combinattion exerted the greatest effect upon invertebrate numbers. Both herbicide combinations, however, did alter significantly the number of taxonomic groups in the areas. Invertebrate declines were due more generally to resultant habitat changes (i.e., loss of hydrilla) than to direct herbicide toxicity. The response of fish to the effects of the herbicide treatments on invertebrates could be ascribed to dietary changes, decreased growth rates, and possible mortality.--Copyright 1974, Biological Abstract, Inc.

OIL IN THE ARCTIC,
Massachusetts Inst. of Tech. Cambridge.
D. P. Hoult, S. Wolfe, S. O'Dea, and J. P. Patureau.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-A010 269, $6.00 in paper copy, $2.25 in microfiche. Department of Transportation, United States Coast Guard, Final Report No. CG-D-96-75, March 1975. 218 p, 13 fig, 42 ref, 3 append. DOT-CG-12438-A

Descriptors: *Arctic, *Oil spills, *Environmental effects, *Sea ice, *Cold regions, *Resources development, *Water quality, *water pollution sources, Ice, Tundra, Water resources, Continental Shelf.
Identifiers: *Outer continental Shelf, Environmental impact.

A description of the short term history of an oil spill - including the rate of spread, the area covered by the oil, and the effects of leads - is given. The stickiness of oil on sea ice was measured, and the results correlated with a theory which predicts how thick a layer of oil can stick to the ice in Arctic conditions. The evolution of an oil sill in the Arctic is a much slower phenomena than in temperate waters. The area covered, even from a supertanker spill, is quite small. The technological problem of combatting Arctic oil spills is much different than that in temporate water. It is not likely that barriers will be useful or needed. A system with rapid response time is not required. On the other hand, there seems to be no presently known way to locate easily, much less remove, oil trapped under oil in ice. The most important result of this work, which is substantiated by all the research to date, is that the oil in even a very large Arctic spill will be confined to a very small area due to natural processes. This conclusion is supported by both the spreading and pocketing experiments as well as the studies on oil evolution. As a corollary to this result, unlike the situation in temperate waters, there is little incentive to promptly clean up large oil spills, as the area of the oil spill will not measurably increase with time, while the oil remains in contact with sea ice. (Sinha - OEIS)

EFFECTS OF PETROLEUM POLLUTANTS ON ARCTIC MICROBIAL POPULATIONS,
Louisville Univ., Dept. of Biology.
R. M. Atlas, E. A. Schofield, F. A. Morelli, and R. E. Cameron.
Environmental Pollution, Vol 10, No 1, p 35-43, January 1976. 2 fig, 20 ref.

Descriptors: *Oil spills, *Water pollution effects, *Microbial degradation, Environmental effects, Resources development, Water resources, Continental shelf, *Alaska, Fossil fuels, Coasts, Ponds, Bacteria, Protozoa, Algae, Diatoms, Seepage, Fungi, Lichens, Microorganisms, Pseudomonas, Bays.
Identifiers: North Slope, Prudhoe Bay(Alas), Crude oil, Coastal ponds, Oil seepages, Sepcies diversity, Arctic, Environmental impact.

Microorganisms encounter oil in the Arctic from natural seepage and accidental spillages. Incubation of Prudhoe crude oil with water from coastal ponds along Prudhoe Bay resulted in several changes in the microbial communities. Bacterial populations increased by several orders of magnitude; ameoboid protozoa were replaced by flagellated protozoa; coccoid green algae completely disappeared; diatoms increased and blue-green and green filamentous algae appeared to be unaffected. The microbial populations associated with a natural oil seepage at Cape Simpson were markedly different from those of the adjacent areas. The seep was devoid of vascular plant cover and, in some areas, of bacteria. Fungi were found to be abundant in the bacteria-free regions. Lichens flourished in the older sections. Underlying oil slicks experimentally floated in Prudhoe Bay, the bacterial population increased, in large part attributable of oil degrading Pseudomonads, but species diversity appeared to be unaffected. METABOLIC CYCLES FOR TOXIC ELEMENTS IN AQUEOUS SYSTEMS,
Minnesota Univ., St. Paul. Freshwater Biological Research Foundation.
J. M. Wood.
Rev Int Oceanogr Med. 31/32, p 7-16, 1973.

Descriptors: *Metabolism, *Toxicity, *Mercury, *Arsenic, Cycling nutrients, Elements(Chemical), Microorganisms, Systematics.

The elements are classified according to their toxicity and availability; toxic and relatively accessible elements such as Hg and As are studied in detail. Two types of equilibria, inorganic and organometallic, are considered. When an element is introduced into an environment rich in microbial activity, each valence state is made available for metabolic interconversions. The interconversion of inorganic complexes to organometallic complexes is important because the latter are readily transported and accumulated into tissues of high lipid content. This interconversion is made by methylating agents which are available for methyl transfer reactions in biological systems. The Hg and As cycles are summarized.--Copyright 1974, Biological Abstracts, Inc.

THE DISTRIBUTION OF COLIFORMS IN FRESH WATER, (IN JAPANESE),
Shimane Univ., Matsue (Japan). Faculty of Agriculture.
M. Matsumoto, Y. Nishitai, and A. Tanaka.
Bull Fac Agric Shimane Univ. 7, p 140-145, 1973.

Descriptors: *Coliforms, Freshwater, *Distribution, E. Coli, Streams, Euteric bacteria, Water pollution.
Identifiers: Enterobacter-aerogenes, *Japan.

The relationship between the degree of pollution and the types of coliforms in the water of the Mochida, a rural stream in Matsue City, Japan, was investigated. Water was sampled at 4 stations ranging from the nonsaprobic upper part to the saprobic lower part of the stream twice monthly from April 12, 1972-April 13, 1973. Coliforms were found in all samples, and the number of total bacteria, coliforms and Escherichia coli increased parallel to the degree of pollution. The ratio of coliforms to total bacteria was about 3:5% for all samples investigated. The ratio of E. coli to coliforms was 1:15%, and increased markedly with the degree of pollution. Intermediate types dominated over Aerobacter (Enterobacter) aerogenes in the nonsaprobic upper stream. Most of the E. coli and A. aerogenes isolates were identified as type I. Only 1 strain of pathogenic E. coli was found among the 259 strains examined.--Copyright 1975, Biological Abstracts, Inc.

ORGANIC PRODUCTIVITY OF INSHORE AND OFFSHORE WATERS OF BARBADOS: A STUDY OF THE ISLAND MASS EFFECT,
Bellairs Research Inst., St. James (Barbados).
F. Sander, and D. M. Steven.
Bull Mar Sci. 23(4), p 771-792, 1973.

Descriptors: *Productivity, *Primary productivity, *Nutrients, *Diatoms, *Phytoplankton, Seasonal, *Copepods, Chlorophyll, Salts, Plant physiology.
Identifiers: *Barbados Island.

Repeated observations of primary and secondary production and related hydrographic and nutrient characteristics were made at inshore stations at Barbados from July 1968, to June 1970, for comparison with an offshore site. No evidence of regularly recurring variations of a seasonal nature was seen in the magnitudes of production and nutrient salts. Production showed progressive increase offshore to inshore consistent with an 'island mass' effect. Diatoms were consistently the most prominent phytoplankton group inshore. Increased primary production near land was mainly exploited by copepods. Assimilation numbers, which were considerably higher inshore than offshore, suggest that C fixation/unit of chlorophyll was less efficient in oceanic water and were indicative of the respective physiological states of the plant populations.--Copyright 1974, Biological Abstracts, Inc.

Lejeunia. 69, p 1-58, 1973.

Descriptors: *Water pollution, Vegetation, Europe, Rivers, *Ecological distribution, Data collections.
Identifiers: *Bryophytic vegetation, *Hepaticae, Musci, Ordination, *Belgium(River Sambre).

The biotope is described, with its geographical and physico-chemical characteristics, to point out the main features of the ecological factors. A list of the bryophytes (Musci; Hepaticae), with some taxonomic comments and the distribution of the species, is established followed by a conspectus of the bryophytic communities. Quantitative methods, global covering of all the species, coefficient of development, coefficient of difference and principal components analysis were used to organize the data. The last method, based upon the correlations between the used variables, allowed ordering the stations on physico-chemical data and the biological data for comparison of the two.--Copyright 1974, Biological Abstracts, Inc.

QUANTITATIVE ASPECT OF THE PHYTOPLANKTON OF THE BAY DU LEVRIER (MAURITANIA), (IN FRENCH),
Museum National d'Histoire Naturelle, Paris (France). Laboratoire des Peches Outre-Mer.
J. Reyssac.

ll Mus Natl Hist Nat Ecol Gen. 5, p 101-112, 73.

escriptors: Bays, *Phytoplankton, Diatoms, lutrients, *Primary productivity, Dinoflagel-es, Gymnodinium, Red tide, Seasonal, trophication, Chlorophyll.
entifiers: Coccolithophorids, Levrier, lauritania(Bay du Levrier).

e quantitative evolution of phytoplankton was died during April-May 1972 in the Baie du vrier. Population vary strongly in time and ace but are always very abundant: 1 to 2 millions cells/liter in the south and more than 3 millions the north. The phytoplankton consists chiefly of ccolithophorids, diatoms and a dinoflagellate ymnodinium) the intense multiplication of hich has caused red water (red tide). Concentra-ns of chlorophyll a are very high: 5 to 6 /cubic meter in the north of the bay and equently more than 10 mg/cubic meter in the uth. The primary production is high in every sta-n. The monthly averages are included between 2 and 402 mgC/m3/j. The results show that the y has a high fertility.--Copyright 1974, Biologi-l Abstracts, Inc.

IE VEGETATION OF THE 'LUKNIANY AKE' NATURE RESERVE IN THE MAZURI-N LAKE DISTRICT,(IN POLISH),
kademia Rolniczo-Techniczna, Olsztyn-Kor-wo (Poland). Inst. of Plant Biology.
Polakowski, J. Dziedzic, and E. Polakowska.
chr Przyr. 38, p 85-114, 1973.

escriptors: *Aquatic plants, Lakes, *Vegetation, urope, *Eutrophication, Water level fluctuation, ir temperature, Precipitation(Atmospheric), ant grouping, Lake beds.
entifiers: *Charales, *Poland(Lukniany Lake), ushes, Salix-Aurita.

he nature reserve covers an area of 623 ha and es in the district of Mragowo (Poland). It is a trophic lake, rather shallow due to deposits of lcareous gyttja. The differentiation of its ecolog-al conditions is not great. The records of air tem-eratures, precipitation and oscillations of the ater level in Lukniany Lake are presented. In 966-1970 floral, phytosociological and pedologi-l investigations were conducted. The plant as-ciations described and mapped are as follows: haretum aculeolatae, Charetum contrariae, haretum asperae, Charetum tomentosae, otametum lucentis, Scirpo-Phragmitetum, coretum calami, Caricetum paradoxae, aricetum Hudsonii, Salici-Franguletum, Carici ongatae-Alnetum, Lolio-Cynosuretum and the ommunity with Salix aurita. Associations of the harales play the most important part. They cover e bottom of the lake in compact and extensive atches. There is a broad and dense belt of rushes ong the shore line. The areal percentage and role all the other associations listed above is not eat.--Copyright 1974, Biological Abstracts, Inc.

RIMARY PRODUCTION IN THE FROZEN AKE BALATON,
agyar Tudomanyos Akademia, Tihany. Biologi-l Research Inst.
Herodek, and J. Olah.
nn Inst Biol (Tihany) Hung Acad Sci. 40, p 197-06, 1973.

escriptors: *Primary productivity, Lakes, Light, Europe, Ice, Snow, *Chlorophyll, Spatial istribution, Phytoplankton, *Turbidity, Oxygen, Photosynthesis, *Benthos.
lentifiers: Carbon-14, *Hungary(Lake Balaton), rozen lakes.

ne 10th normal light level was transmitted by ice overed by 4 cm snow and 1/2 by snow-free ice. The water was rather clear under the ice, so surface light reached the bottom. This illumination is higher than that in the unfrozen Lake Balaton (Hungary), where due to the turbidity caused by waves the bottom illumination is usually less than 1%. The chlorophyll a content of the water increased downwards. Related to surface it was 1 micro g/cm2. Similar vertical distribution was observed in the micro-algae occurring in the water under the ice. The chlorophyll a content of the bottom was 6.6-8.5 micro g/cm2 on 31 Jan. and 15.1-15.5 micro g/cm2 on the 5 Feb. 1973. When the ice was covered by snow, the primary production of phytoplankton, measured by 14C method, was 4mg C/m2/h and decreased downwards. Under the snow-free ice it was 20 mg C/m2/h and increased downwards. The production of the microphytobenthos was measured by both 14C and O2 methods. No production was found in April-Sept. due to the turbidity of water. In the frozen lake when ice was covered by snow even the gross primary production in the benthos was very low. In case of snowfree ice, intensive benthic photosynthesis was found. The primary production at 3 different days was 36 mg C/m2/h, 122 mg O2/m2/h and 115 mg O2/m2/h. In the lake covered by snow-free ice, the total primary production of the plankton and benthos was amounted to 560 mg C/m2/day, which similar to the summer maximum of planktonic production. In the ice-covered lake, the O2 content of the water was with 9.6 mg/l higher than before freezing.--Copyright 1974, Biological Abstracts, Inc.

THE PRIMARY PRODUCTION OF PHYTOPLANKTON IN LAKE BALATON APRIL-SEPTEMBER 1972,
Magyar Tudomanyos Akademia, Tihany. Biological Research Inst.
S. Herodek, and G. Tamas.
Ann Ins Biol (Tihany) Hung Acad Sci. 40, p 207-218, 1973.

Descriptors: *Primary productivity, Lakes, *Biomass, *Phytoplankton, *Algae, *Diatoms, Turbidity, Light, Eutrophication, Storms.
Identifiers: *Ceratium-Hirundinella, *Cyclotella-Bodanica, *Hungary(Lake Balaton).

The phytoplankton biomass, illumination and primary production were measured fortnightly at 4 depths in Lake Balaton (Hungary). In the samples 108 algal spp., 5 varieties and 1 form were found. The biomass of each species and the total phytoplankton were calculated from the number of algae and from the volume of individuals. Until the middle of July, the plankton was dominated by diatoms, the largest mass was formed by Cyclotella bodanica. Ceratium hirundinella became the dominating species first in the second half of the summer. The average biomass was 10.3 g/m2. Transparency is very unstable in the lake, due to the frequent swirling up of the mud. In storm, the primary production stops at 1 m depth because of light insufficiency while after a long calm period, in the clear water the deepest layer (3 m) exhibited the highest production. In general, at the surface the production is inhibited by excessive illumination, the maximum is found at 1 or 2 m, and at 3 m the same mass of algae produced 4 times less than at 1 m, owing to the insufficient light. The mean production and the standard error of the mean during 4 h were 118 + 8 mg C/m2. The average daily production was estimated to be 413 mg C/m2, the primary production during the half-year to 76 g C/m2. This primary production corresponds to that of the slight eutrophic lakes.--Copyright 1974, Biological Abstracts, Inc.

REACTION TIMES OF CERTAIN FRESHWATER FISHES TO A ROTENONE-CONTAINING PISCICIDE,
Natl. Parks Board, Pietermaritzburg, S. Afr.
D. T. Rowe-Rowe.
J South Afr Wildl Manage Assoc. 3(1), p 16-18, 1973.

Descriptors: Freshwater fish, *Rotenone, *Piscicides, *Fish control agents, Water temperature, Bass, Rainbow trout, Tilapia, Carp.
Identifiers: Barbus-Anoplus, Barbus-Gurneyi, Barbus-Natalensis, Barbus-Viviparus, Cent-Depress-Drug, Micropterus-Salmoides, Tilapia-Melanopleura, Tilapia-Mossambica, Yellowfish.

The reaction times (loss of equilibrium) for certain freshwater fishes were determined in laboratory tests (9 spp.) and in the field (10 spp.). Barbasco (6.8% rotenone) was used in all tests. Eight of the laboratory species were tested using 0.068 ppm rotenone concentration at approximately 21C. Field data were obtained from various size fish in water ranging from 13-26C and at concentrations of 0.034-0.136 ppm rotenone. The reaction time varied with size of fish and temperature of water. The following species were used in the experiments: Mozambique tilapia (or blue kurper) Tilapia mossambica; red-chested tilapia Tilapia melanopleura; Natal yellowfish or scaly Barbus natalensis; 3 spp. of minmow B. viviparus, B. gurneyi and B. anoplus; largemouth bass Micropterus salmoides; carp Cyprinus carpio; and rainbow trout Salmo gairdneri.--Copyright 1974, Biological Abstracts, Inc.

LABORATORY AND FIELD TESTS IN THE REVIVAL OF FISH AFFECTED BY ROTENONE,
Natal Parks Board, Pietermaritzburg, (South Africa).
D. T. Rowe-Rowe.
J South Afr Wildl Manage Assoc. 3(1), p 19-21, 1973.

Descriptors: *Rotenone, Laboratory tests, Fish control agents, Rainbow trout, Tilapia, Bass.
Identifiers: Barbus sp., Cent-Depress-Drug, Micropterus-Salmodies,

Various methods of reviving fish affected by rotenone were tested in the laboratory. The most successful method was simply to transfer affected fish (Barbus spp., Tilapia sp., Salmo gairdneri and Micropterus salmoides) to fresh water, as rapidly as possible after they lost equilibrium due to the rotenone. An alternative successful method was to add potassium permanganate simultaneously with the rotenone. These 2 methods, which gave success in the laboratory, also proved to be effective in the field.--Copyright 1974, Biological Abstracts, Inc.

METHOD FOR ELIMINATING ORGANIC AND INORGANIC BOUND NITROGEN FROM DOMESTIC AND INDUSTRIAL WASTE WATER,
M. Dubach, and A. Scherler.
Canadian Patent 986,627. Issued March 30, 1976. Patent Office Record, Vol. 104, No. 13, p 83, March, 1976.

Descriptors: *Patents, *Nitrogen, *Ammonia, *Waste water treatment, *Municipal wastes, Industrial wastes, Nitrification, Denitrification, Sedimentation, Treatment facilities, Biological treatment, Aeration, Settling basins.

A method to eliminate organic and inorganic bound nitrogen from municipal and industrial waste water has been patented. A biological waste water treatment plant is utilized and consists of two stages connected in series. Each contains an aeration tank and a settling basin. Waste water entering the treatment plant will be aerated in the first stage aeration tank. It will subsequently be introduced into the settling basin where overflow is removed, free of oxygen. The mixture is then introduced into a second stage where it will again be aerated and subsequently introduced into a second stage settling basin. Favorable conditions for extensive nitrification of the ammonia are provided and a portion of the nitrified waste water is continuously recirculated from the settling basin of the second stage to the first stage. The recirculated portion of the waste water is denitrified in the settling basin of the first stage where ammonification of the organic bound nitrogen occurs as well as denitrification of the nitrate in the influent and the nitrate in the recirculated effluent. SANITARY WASTE TREATMENT PLANT,
Thetford Corp., Ann Arbor, Mich. (Assignee).
L. O. Eger, and S. C. Crosby.
United States Patent 3,950,249. Issued April 13, 1976. Official Gazette of the United States Patent Office, Vol. 945, No. 2, p 824, April, 1976.

Descriptors: *Patents, *Waste water treatment, *Biological treatments, Water reuse, Filtration, *Treatment facilities.

A plant for treating sanitary waste is patented. It comprises systems for delivery, biological treatment, and water recovery. The delivery system includes a flush-type toilet which has a demand actuator, a bowl for depositing sanitary waste, flush water supply means for transferring clear water from the water recovery system to the delivery system and for supply ing the clear water as flush water under pressure to the bowl when the demand actuator is actuated, and delivery means to deliver the sanitary waste adnd flush water to the biological treatment system when the demand actuator is actuated. The biological treatment system biologically reduces the sanitary waste it receives and discharges an effluent to the water recovery system. The water recovery system includes ultrafiltration means to separate the effluent into an effluent concentrate and a water permeate. The ultrafiltration means has a tubular semipermeable membrane. Effluent is introduced into its one end axially under pressure and effluent concentrate discharged from the other. The ultrafiltration means also has a permeate collector tube surrounding the tubular membrane to collect, at a lower pressure, permeate passing through the membrane, and recirculation means which include a pump to return a portion of the effluent concentrate to the biological treatment system and for returning the remainder of the effluent concentrate at the first pressure to the ultrafiltration means to be further separated into water permeate and effluent concentrate, water storage means, and secondary filtration means to receive and polish the water permeate, in communication with the ultrafiltration means allowing the permate to be discharged at the second pressure from the ultrafiltration means to the secondary filtration means for polishing and discharge as clear water to the water storage means. The water storage means communicates with the delivery system to transfer the clear water to it by flush water supply means. (Snyder-FIRL)

AERATED SEWERAGE DISPOSAL,
A. J. Smith.
United States Patent 3,951,804. Issued April 20, 1976. Official Gazette of the United States Patent Office, Vol. 945, No. 3, p 1347, April, 1976. 1 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewage disposal, *Aeration, *Patents, Equipment, *Septic tanks.
Identifiers: Rotary agitators(Wastes).

An aerated sewage disposal system has been patented. It comprises a septic tank, an enclosed compartment for aeration, and a rotary agitator. The septic tank has an inlet for sewage and an outlet for discharging liquids. The enclosed aeration compartment has an inlet to receive liquids directly from the discharge outlet of the septic tank and an outlet for aerated liquids. The compartment has side wall structure, a bottom wall, and rounded corners that extend between the side wall structure and the bottom wall. The rotary agitator is located in the enclosed aeration compartment to agitate liquids and cause them to flow downward in the compartment. A tubular shaft extends downward to approximately the agitator's level to carry and rotate the agitator and conduct air downward into the downward flowing agitated liquid. It has an air outlet in the compartment at approximately the agitator depth. A motor is connected to the upper end of the tubular shaft to rotate it. The rounded corners are located laterally and below the agitator sufficiently close to it to turn the flowing liquid, which contains air, upward along the side wall structure. The aeration compartment has vent means to allow air to pass between its interior and exterior. The volume of liquid and sewage in the tank, filled to its outlet level, exceeds the volume of liquid and sewage in the compartment when filled to the level of its outlet and more than 50% of the sewage solids are trapped in the tank. Control means connect with the motor, operating it intermittently, with substantially more time off than time on. There is a smaller additional tank with an inlet connected to the compartment outlet; an outlet connected to the leach line; and means, which include a pump, to return aerated liquids from the additional tank to the compartment. (Snyder-FIRL)

SLUDGE REMOVAL SYSTEM,
Ecodyne Corp., Lincolnshire, Ill. (Assignee).
R. L. Shaffer, and D. G. Mason.
United States Patent 3,951,819. Issued April 20, 1976. Official Gazette of the United States Patent Office, Vol. 945, No. 3, p 1352, April, 1976. 1 fig.

Descriptors: *Waste water treatment, *Sludge treatment, Sludge, Equipment, *Patents, Settling basins.
Identifiers: Sludge removal, Clarification, *Clarifier tanks.

An improved assembly for sludge removal in a circular clarifier tank having an inlet for receipt of liquid influent with entrained solids, an upper overflow outlet for removal of clarified liquid, and a bottom surface on which settled solids deposit is patented. The sludge removal assembly comprises a suction arm, sludge conduits, vertical riser tubes, a sightwell assembly, and valve assembly means for flow control. The suction arm has self-supporting sludge conduits of differing lengths which extend outward from and are mounted for rotation around an axis which is substantially vertical extending through the tank's center. The sludge conduits are secured to each other in a horizontal plane above the bottom surface of the tank. The sludge conduits have suction ports for inlet along their bottom surfaces adjacent to their outer ends to receive sludge from the bottom surface of the tank. The lower ends of many riser tubes which are substantially vertical are secured to the corresponding sludge conduits' inner ends. The sightwell assembly is positioned above the riser tubes' upper ends. Its lower portion is below the tank's static liquid level, and its upper portion is above the liquid level. Valve assembly means for flow control are associated with each riser tube's upper end for controlling the flow rates from the riser tubes into the sightwell assembly. These valve assembly means include adjustable orifice means whose lower portion is below the tank's static liquid level and whose upper portion is above this level. (Snyder-FIRL)
W76-09416

SEWAGE TREATMENT TANK AND TUBE SETTLER,
Jet Aeration Co., Cleveland, Ohio. (Assignee).
J. R. Snyder.
United States Patent 3,951,817. Issued April 20, 1976. Official Gazette of the United States Patent Office, Vol. 945, No. 3, p 1351, April, 1976. 1 fig.

Descriptors: *Waste water treatment, Equipment, *Patents, *Settling basins, Sedimentation, *Sewage treatment.
Identifiers: Tube settlers.

A tube settler has been patented which include numerous generally parallel spaced plates. Each plate has two faces, an opposed side, and end edge portions. Each plate also has numerous generally parallel spaced deflector members which extend outwardly from and are integrally connected to its first face and terminate adjacent to and spaced from an adjacent plate's second face. Each deflector member has wall means defining an elongated chamber with side walls tapering toward each other as they extend away from the plate to which they are connected. The elongated chamber also has opposed end walls. The deflector members extend outwardly generally perpendicular to the plates and in a direction at an acute angle to the side edge portions of the plates. The invention also includes means for holding the plates in their generally parallel spaced relationship. (Snyder-FIRL)
W76-09417

MARINE SEWAGE DISPOSAL DEVICE,
N. H. Siegel.
United States Patent 3,951,803. Issued April 20, 1976. Official Gazette of the United States Patent Office, Vol. 945, No. 3, p 1346-1347, April, 1976. 1 fig.

Descriptors: *Sewage disposal, *Sewage treatment, Equipment, *Patents, Tanks, Filtration, Heat, *Waste water treatment.
Identifiers: Marine sewage disposal.

A device for sewage disposal, adapted to receive discharge from a marine toilet, was patented. It incorporates means to kill coliform bacteria in the sewage. Storage tank means with an inlet to receive untreated sewage are included. Septum means within the tank means define an enclosure, vertically oriented. The septum means have lower and upper openings which communicate with the storage tank means' interior for recycling nonparticulated sewage. There are macerator means disposed in the vertically oriented enclosure with an impeller at its lower end. The enclosure has fil-

ring screen means at its upper end, forming an utlet to pass particulated sewage impelled by the acerator. Pre-treatment storage means with an let bordering the screen which receives particu-ted sewage are also included. A compartment for ewage treatment is disposed beneath the pre-orage means. First valving means form an outlet the pre-treatment storage means' lower end and n inlet to the sewage treatment compartment, al-wing particulate sewage to pass by gravity from ie pre-treatment storage means to the treatment ompartment. Heating means are provided, in-uding two electrodes disposed within the treat-ent compartment which operate automatically hen sufficient particulate sewage is present, to orm an ionizable fluid. Second valving means are isposed at the lowest part of the treatment com-artment to form an outlet to drain it of treated aste. Thermostatic means are included for the eatment compartment, to determine completion f a treatment cycle and control operation of the alving means. (Snyder-FIRL)
V76-09418

LUDGE CONTROL AND DECANT SYSTEM,
larsco Corp., Harrisburg, Pa. (Assignee).
. D. Ward, and M. W. Ray.
Inited States Patent 3,951,788. Issued April 20, 976. Official Gazette of the United States Patent Office, Vol. 945, No. 3, p 1341-1342, April, 1976. 1 ig.

Descriptors: *Sewage treatment, *Patents, Biological treatment, Aeration, *Waste water reatment, Pumps, *Sludge treatment, Separation echniques.
dentifiers: *Decanting(Wastes).

A system for sewage treatment is patented, com-prising an aeration tank, a clarifier tank, a baffle etween the aerator tank and the clarifier tank, a ecant tank, gravity fluid flow communication neans between the aeration tank and the decant ank, a pump and means connecting it for remov-ng clarified liquid from the upper portion of the ecant tank and to deliver the clarified liquid to the eration tank, a sludge digester container, a sludge ischarge line with a second pump, and first and econd timer means. Means to aerate the waste ater are included in the aeration tank. Liquid lows over the upper edge of the baffle from the eration tank into the clarifier tank. The means for gravity flow communication have an intake at an elevation below that of the baffle's upper edge to prevent floating matter from entering the decant ank. The discharge line for sludge connects with the decant tank's lower portion and sludge digester container. The first timer means is connected to the first pump so that it will remove clarified liquid at selected intervals for selected time periods. The second timer means is connected to the second pump so that it will discharge sludge from the de-cant tank for selected time periods and at selected intervals to maintain the aeration tank's biological balance. (Snyder-FIRL)
W76-09419

APPARATUS FOR SEWAGE TREATMENT AND WASTEWATER RECLAMATION,
Hebrew Univ., Jerusalem (Israel); and Yissum Research Development Co., Jerusalem (Israel). (Assignee).
G. Shelef.
United States Patent 3,954,615. Issued May 4, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 1, p 246, May, 1976. 1 fig.

Descriptors: *Waste water treatment, Algae, Lagoons, *Aeration, *Biological treatment, *Patents, Recycling, Oxygen, Ponds, *Aerated lagoons, Water reuse, *Sewage treatment.

An improvement has been patented in a system to treat waste water using algae. The technology consists of a pond which contains means for channeling the waste water along an endless path and means to aerate and maintain the flow of waste water. According to the improvement, the pond is deeper beneath the aeration means than the path depth in the remaining parts of the pond. The greater depth provides a solubility gradient which increases the amount of oxygen than can be dissolved into the liquid by the aeration means. (Snyder-FIRL)
W76-09420

SEPARATION OF SLUDGE,
W. Aldag.
United States Patent 3,953,328. Issued April 27, 1976. Official Gazette of the United States Patent Office, Vol. 945, No. 4, p 1847, April, 1976. 1 fig.

Descriptors: *Sludge treatment, *Patents, *Separation techniques, Suspended solids, *Waste water treatment, Aeration, Equipment.
Identifiers: Clarification.

A method was patented for separating sludge and suspended material from the liquid being purified. Liquid flows into the clarification chamber by way of an aeration chamber. In the clarification chamber a rising liquid stream is established whose speed of flow decreases as this liquid rises. Suspended material in this rising stream is concentrated in an intermediate zone of the clarification chamber in which the tendency of the material to sink due to gravity is approximately equal to the tendency for it to be carried upward in the stream. The concentrated material is drawn off by suction means at the intermediate zone and at least partly fed back to the aeration chamber's upper zone. The suction means disposition is varied to the level of the intermediate concentration zone. The aeration chamber and the clarification chamber are in fluid communication to receive liquid in the rising stream from the former. The clarifying chamber is shaped to decrease the flow speed of the stream while the liquid rises. There are one or more pumps with an outlet in the aeration chamber and a suction pipe arranged with its inlet in the clarification chamber at an intermediate level between the outlet level and the fluid communication. The suction pipe inlet is at such a level that suspended material in the liquid stream, which concentrates at the intermediate zone, is drawn out of the clarification chamber with the pump to be at least partially returned to the aeration chamber at an upper level. SEWAGE TREATMENT PROCESS,
Central Contra Costa Sanitary District, Walnut Creek, Calif. (Assignee).
D. S. Parker.
United States Patent 3,953,327. Issued April 27, 1976. Official Gazette of the United States Patent Office, Vol. 945, No. 4, p 1847, April, 1976. 1 fig.

Descriptors: *Waste water treatment, *Patents, *Sewage treatment, *Aerobic treatment, Nitrification, Denitrification, *Nitrogen compounds.
Identifiers: Anoxic conditions.

A process has been patented for treating sewage which contains nitrogen compounds. First, nitrogen compounds are converted to the nitrate form by nitrification. The nitrified sewage is then subjected to substantially anoxic denitrification in the presence methanol. The denitrified sewage is then stabilized by thoroughly aerating it under agitation conditions. The sewage is then flowed from the stabilization step and clarified, producing an effluent and sludge. The sludge is recycled directly to the denitrification step so that it will also be subjected to substantially anoxic denitrification. The purified effluent is withdrawn from the process. (Snyder-FIRL)

SEWAGE TREATMENT AERATION SYSTEMS,
Water Pollution Control Corp., Milwaukee, Wis. (Assignee).
P. M. Thayer.
United States Patent 3,953,553. Issued April 27, 1976. Official Gazette of the United States Patent Office, Vol. 945, No. 4, p 1905-1906, April, 1976. 1 fig.

Descriptors: *Patents, *Aeration, *Sewage treatment, *Waste water treatment, Equipment.
Identifiers: Header-connector assembly(Tanks).

A prefabricated header-connector assembly adapted for inclusion in a sewage aeration tank by the attachment of a low pressure air supply and diffusers to several inter-connected header-connector assemblies has been patented. It maintains the attached diffusers properly aligned in a common plane. It comprises a header and numerous connectors secured to it at different locations. The header is of weldable material with numerous nipples outwardly projecting from it at spaced locations. Each connector is oriented transversely to the header. The connectors have means for coupling with diffusers. Each connector has nipples drawn from it with their open ends welded to different header nipples. (Snyder-FIRL)
W76-09423

METHOD AND APPARATUS FOR REJUVENATING A BED OF GRANULAR FILTER MEDIUM,
Hydromation Filter Co., Livonia, Mich. (Assignee).
G. Hirs.
United States Patent 3,953,333. Issued April 27, 1976. Official Gazette of the United States Patent Office, Vol. 945, No. 4, p 1849, April, 1976. 1 fig.

Descriptors: *Patents, *Filtration, *Suspended solids, Equipment, Recycling, Filters.
Identifiers: *Granular filters.

An improvement has been patented for a method of filtering lint-like and particulate contaminants from a contaminated liquid by passing it through granular filter medium in a bed contained in a housing where the contaminants accumulate and at least some particulate contaminants and the filter granules agglomerate. The improvement consists of renewing the filter medium bed after an appreciable quantity of contaminants accumulate. This is done by expanding the filter bed and violently agitating it to break the agglomeration into particulate contaminants and filter granules. The filter bed is reformed with the lint-like material predominantly in its upper portion, the larger broken-up particulates in the lowest portion, and the other particulate interspersed through the bed. Diluting liquid is introduced into the bed between its lower and upper surfaces. Simultaneously a portion of this liquid flows upward fairly rapidly through only the part of the bed above the point where the liquid is introduced to expand and upwardly backwash interspersed lint-like contaminants and particulates. A slurry of interspersed particulates and granular filter material mixed with the rest of the dilution liquid is separately withdrawn below a point where liquid is introduced and flows in a continuous path including a cleaning element which removes at least part of the particulates from the mixture. The filter material is returned to the bed in the liquid flow. The liquid flow is terminated after sufficient cleaning of the filter bed. The bed is then reformed for further filtration of dirty liquid. (Snyder-FIRL)
W76-09424

STABILIZATION OF WASTE MATERIAL,
General Signal Corp., Rochester, N. Y. (Assignee).
E. H. Bradley.
United States Patent 3,953,331. Issued April 27, 1976. Official Gazette of the United States Patent Office, Vol. 945, No. 4, p 1848, April, 1976. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Oxidation, Equipment, Aeration.
Identifiers: Tanks.

A system has been patented to purify wastes. It includes two reaction tanks, each internally unobstructed, and means to deliver waste material for purification to the first tank. The delivery means include a conduit and a pump means. Means are also provided to introduce an oxidizing agent in the conduit in front of the pump means. A mixture of chemical oxidizing agent and waste material is pumped into the first reaction tank. Discharge conduit means from the first tank are directly connected to the delivery means and to the second tank to recirculate a portion of the mixture through the first tank and to deliver the remainder of the mixture to the second tank. Pressure is maintained in the tank so that fairly rapid chemical oxidation can take place during the mixture's entire circulation through the tanks. A rotatable impeller tends to oppose the fluid flow from the second tank while the first pump pumps the pressurized fluid to the first tank. A method for stabilizing waste material is also included. An oxidizing agent is mixed with waste material to be stabilized, and the mixture is rapidly circulated under pressure in the second zone where the oxidation is permitted through the two zones. The conduit and the rotatable impeller simultaneously maintain pressure in these zones by engaging the rotatable impeller in the conduit so as to tend to oppose flowing of the mixture from the second zone to the conduit. (Snyder-FIRL)

SEPTIC TANK SYSTEM,
A. L. Wilkerson.
United States Patent 3,954,612. Issued May 4, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 1, p 245-246, May, 1976. 1 fig.

Descriptors: *Septic tanks, *Patents, *Sewerage, Waste disposal, Conduits, Equipment, Effluents, *Sewage treatment, Domestic wastes, *Waste water treatment.

A septic tank system has been patented. The septic tank has an inlet for receiving sewage and, just below its top, an outlet for the liquid effluent, with a tributary connected to it for the effluent, allowing it to soak into the ground. The tributary comprises an elongated ditch filled with a substance such as gravel to about the outlet's top and means in the tributary to indicate above the ground surface the effluent level in the tributary. The indicator facilities include a vertical conduit that extends from above the ground surface to the lowest part of the ditch that forms the tributary. The conduit has openings with the associated screen whose mesh size is selected to allow liquid entry into the conduit but not entry of gravel from the ditch into the pipe, allowing flow of effluent from the tributary into the conduit until the effluent level in the tributary is reached. A float in the conduit floats in the effluent. Means attached to this float extend above the surface of the ground to indicate the level of effluent in the tributary. Excess effluent can be pumped directly from the tributary before causing sewage back-up to the septic tank. This includes a second conduit that extends from the ground surface through the gravel to about the tributary bottom. This conduit has perforations adjacent to its bottom with the associated screen whose mesh size is selected to allow liquid effluent but not gravel from the ditch to enter the conduit. In this way, the effluent can be pumped from the tributary to substantially remove all the liquid effluent in the ditch. (Snyder-FIRL)

APPARATUS FOR TREATING INDUSTRIAL AND DOMESTIC WASTE WATERS,
Degremont, Rueil-Malmaison (France). (Assignee).
A. B. Turner.
United States Patent 3,956,128. Issued May 11, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 2, p 731-732, May, 1976. 1 fig.

Descriptors: *Waste water treatment, *Patents, Domestic wastes, Industrial wastes, Equipment, *Aeration, Biochemical oxygen demand, *Filtration, *Filters.
Identifiers: *Combined treatment.

A system to treat domestic and industrial wastes has been patented. It includes a tank, a filter in the tank, and an aerated packed column mounted above the filter in the tank. The column includes bacteria support media with approximately 50 sq ft/cu ft surface area. Screened sewage with suspended solids is introduced into the tank via an inlet and passed downward through the column and filter. Effluent outlet means are included at the lowest part of the tank to remove effluent. By-pass passage facilities which include a pump extend from the outlet to the lower portion of the tank for recirculating some of the effluent into the tank. Means are connected to the by-pass passage to aerate the recirculated effluent, to cause the air upon entering the tank to separate as small bubbles from the recirculated effluent, and to force these bubbles upward through the support media, providing oxygen for microorganisms growing on it that biologically remove the biochemical oxygen demand (BOD) loading in the sewage. Means positioned on the tank receive and burn floc rising to the tank's surface from the support media. (Snyder-FIRL)
W76-09429

SEWAGE SEPTIC SYSTEM FOR A PLURALITY OF DRAIN FIELDS,
Langley Hill Quarry, Woodside, Calif. (Assignee).
J. G. Dempsey.
United States Patent 3,956,137. Issued May 11, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 2, p 735-736, May, 1976. 1 fig.

Descriptors: *Patents, *Septic tanks, *Sewage treatment, *Drainage, Domestic wastes, Pipelines, Waste disposal, Treatment facilities, *Waste water treatment.

A septic sewage system has been patented. It comprises a septic tank, numerous septic drain fields, and diversion means to direct the effluent to the drain field or fields selected. The septic tank supports a bacteriological action. It includes a sewage settlement compartment and an effluent compartment that communicates with the settlement compartment. An inlet pipe communicates with the settling compartment to deliver raw sewage. An outlet pipe communicates with the effluent compartment to discharge effluent. Each septic drain field has a pipeline to convey effluent. Diversion equipment is connected between the outlet pipe of the effluent compartment and the septic drain field pipelines. This includes an enclosure into whose interior the outlet pipe passes, having a lid to facilitate access to its interior, and a gate valve within the enclosure for each drainage field connecting the outlet pipe with its associated field's pipeline. Each gate valve has a housing connecting the outlet pipe with the pipe line. A gate within the housing can be moved between a position blocking flow between the outlet pipe and the associated drain field pipeline, and a retracted position that permits effluent flow from the outlet pipe through the pipe line. (Snyder-FIRL)

WASTE PURIFICATION SYSTEM,
Bio-Kinetics Inc., San Rafael, Calif. (Assignee).
J. R. Hulls.
United States Patent 3,955,318. Issued May 11, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 2, p 464, May, 1976. 1 fig.

Descriptors: Algae, *Patents, *Sewage treatment, *Waste water treatment, Nutrient removal, Aeration, Nitrogen, Phosphorus, Recycling, Water purification, *Biological treatment, Biodegredation.

A continuous method to grow substantially unicellular algae, simultaneously purifying biodegradable wastes that contain aerobic bacteria, has been patented. Such a waste material would be sewage after communication and removal of most particulate matter, including nonbiodegradable matter, and after being largely freed from turbidity so that light can effectively penetrate it. An aqueous mixture of the algae and waste material is prepared. The waste material provides nitrogen and phosphorous for the algae and is mixed in an amount sufficient to support its growth. The mixture is aerated, agitated, and supplied with air and carbon dioxide in an amount balancing bacterial and algal growth. The agitated mixture is circulated in many cycles. It is then exposed in each cycle for approximately 0.5 sec to 2 sec to light to induce photosynthesis and then subjected to a dark period. Photosynthesis is effected without excessive oxidation of thylakoids, which are an inherent part of algae. The dark period is sufficient for regenerating the thylakoids. Algae are grown and substantially all of the waste material is consumed. An algae product and purified water effluent are separately recovered, recirculating some of the algae product. (Snyder-FIRL)
W76-09431

WASTE TREATMENT APPARATUS,
Ecolotrol, Inc., Bethpage, N. Y. (Assignee).
J. S. Jeris, C. Beer, and J. A. Mueller.
United States Patent 3,956,129. Issued May 11, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 2, p 732, May, 1976. 1 fig.

Descriptors: *Biological treatment, *Patents, *Denitrification, Equipment, *Waste water treatment, Separation techniques, Oxidation.
Identifiers: *Fluidized beds.

Equipment has been patented to biologically denitrify water that contains oxidized nitrogen. It comprises a substantially vertically disposed elongated container, a manifold that is disposed toward the bottom of the container to control passage of water, an inlet to allow the container to receive water for processing, a fluidized bed of denitrifying microorganisms attached to a solid particulate carrier disposed in the container above the manifold, and means to add a carbon source to the fluidized bed. The fluidized bed is arranged to receive the water from the manifold and convert biologically substantially all the oxidized nitrogen being removed to water, nitrogen gas, and cellular material. The container has outlet means for receiving the processed water and at least some particulate carrier having excess cellular material. Means are provided for separating the processed water from the carrier. Processing means are connected to the separating means to receive the separated carrier, and for separating the excess cellular material and the particulate carrier. (Snyder-FIRL)

WASTEWATER TREATMENT SYSTEM WITH CONTROLLED MIXING,
Air Products and Chemicals, Inc., Allentown, PA. (Assignee).

. S. Block, M. S. Chen, and O. J. Noichl.
Jnited States Patent 3,954,606. Issued May 4, 976. Official Gazette of the United States Patent Office, Vol. 946, No. 1, p 243, May, 1976. 1 fig.

Descriptors: *Patents, *Biochemical oxygen demand, *Aeration, *Oxygenation, *Waste water reatment, Equipment, Mixing, Control.

A method has been patented for oxygenating and educing the biological oxygen demand of a mixed quor. The mixed liquor flows through an aeration asin's elongated liquid zone. This zone is nonartitioned for 80% or more of the mixed liquor epth. Oxygen-rich aeration gas is introduced into he aeration basin. The mixed liquor is oxygenated vith the aeration gas by rotating numerous surface erators spaced along the length of the liquid zone. Surface baffles are provided between all or some f the surface aerators. The penetration depth of he surface baffles into the mixed liquor is mainained between 2 and 20% of the mixed liquor lepth. The mixed liquor backflow ratio is controlled to produce effective liquid staging in the rder of 30 to 80% or more by maintaining the erator mixing factor between 10 and 550. The erator mixing factor is revolutions per minute of he surface aerators multiplied by the ratio of the iameters to the linear velocity of the liquid hrough the liquid zone. (Snyder-FIRL)
W76-09433

CATIONIC ACRYLAMIDE-STYRENE COPOLYMERS AND FLOCCULATION OF SEWAGE THEREWITH,
American Cyanamid Co., Stamford, Conn. (Assignee).
A. T. Coscia, H. P. Panzer, and J. A. Sedlak.
United States Patent 3,956,122. Issued May 11, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 2, p 730, May, 1976.

Descriptors: *Patents, *Waste water treatment, *Flocculation, *Polymers, *Separation techniques, Suspension, Suspended solids, Emulsions, Cations.
Identifiers: Cationic acrylamide-styrene.

A process has been patented to flocculate solids suspended in an aqueous medium. An effective but small amount of an aqueous dispersion of a cationic vinyl polymer is uniformly added to the medium as flocculant for the solids. The polymer comprises 40 mol percent or more of N-(di(C1-3alkyl)aminomethyl)acrylamide hydrophilic cationic linkages, at least 5 mol percent of vinyl hydrophobic linkages, and up to 10 mol percent of acrylic acid hydrophilic anionic linkages. The number of hydrophobic linkages is large enough for the polymer to be insoluble in pure water and small enough for the polymer to be auto-dispersible in pure water. The polymer is distributed through the medium, flocculating a substantial portion of the solids. The flocculated solids and the medium are separated. (Snyder-FIRL)

MICROBIAL REACTIONS IN FACULTATIVE OXIDATION PONDS -- I. THE ANAEROBIC NATURE OF OXIDATION POND SEDIMENTS,
Auckland Univ., (New Zealand).
O. D. Brockett.
Water Research, Vol. 10, No. 1, p 45-49, 1976. 4 tab, 11 ref.

Descriptors: *Anaerobic conditions, *Methane, *Oxidation lagoons, Microorganisms, Kinetics, Sulfide, *Waste water treatment, Bacteria, Sediments, Acids, Microbiology.
Identifiers: Volatile acids, *Microbial reactions.

Volatile acid production, sulfide levels, and methane fermentation were compared in deep and shallow areas of faculative oxidation ponds. Acids were measured by the column partition chromatography method, and methane was collected by displacement with a filter funnel. Volatile acid utilizing sulfide producing bacteria and total sulfide levels were determined by standard methods. Volatile acids concentration, methane production, and sulfate reduction all showed significant increase with increase in pond depth. These results indicate the formation of better anaerobic conditions in the deep areas of the ponds. Gas collected in different areas of the oxidation pond system at different times had essentially the same composition, indicating the uniformity of the anaerobic nature of the ponds. Seasonal changes in volatile acid concentration occurred when biological organic matter from waste fed to the ponds during the winter months and from the pond biomass rapidly decomposed. The volatile acid content returned to lower levels after the load disappeared. (Snyder-FIRL)
W76-09435

PHOSPHATE REMOVAL--TACKLING EUTROPHICATION FROM THE OTHER SIDE,
F. Roberts.
Surveyor, Vol. 147, No. 4370, p 25, March 12, 1976.

Descriptors: *Nutrient removal, *Waste water treatment, *Phosphates, *Nitrates, Eutrophication, *Sewage treatment, Chemical precipitation, Flocculation, Water pollution control, Biochemical oxygen demand.
Identifiers: *Chemical treatment.

While BOD removal has been the primary aim of waste water treatment in the United Kingdom, increasing attention in other European countries has been paid to phosphate removal and the control of eutrophication. Both nitrates and phosphates come from land drainage and sewage effluents. However, it is supposed that phosphates would be easier to control, since a larger proportion comes from the sewage effluent. Typically, 70% of nitrates comes from land drainage and 80% of phosphate from sewage effluent. Such countries as Switzerland, Sweden, and Canada have been developing phosphate removal as an integral part of sewage treatment. Phosphate control may be achieved either by reducing the phosphorus content of sewage (such as done in Canada by requiring that detergents should have a substitute for NTA) or alternatively, by chemical treatment at the sewage works. This involves the use of lime, aluminum salts or ferric salts; the dose for alum could be about 150 mg/liter. The chemical may be incorporated at the beginning of treatment or as an additional process. The effect of phosphorus removal efforts on an already heavily enriched lake or inland waterway are not clear, but experts who treat phosphate problems in an acute form believe that the effort is worthwhile. (Kramer-FIRL)

WHO SAYS SEWAGE TREATMENT PLANTS HAVE TO BE UGLY,
Texas Dept. of Health Resources, Austin. Div. of Wastewater Technology and Surveillance.
W. R. Dinges.
Water and Wastes Engineering, Vol. 13, No. 4, p 20-23, April, 1976. 2 tab.

Descriptors: *Sewage treatment, *Waste water treatment, *Biological treatment, Aquatic plants, Nutrient removal, Floating plants, Water hyacinth, *Treatment facilities.

Studies on the feasibility of using aquatic plants and animals to produce further reduction of undesirable suspended and dissolved substances from water following bacteria and algae treatment phases are being conducted at the Williamson Creek Wastewater Treatment Plant at Austin, Texas. The pilot system consists of an area of 0.14 acres divided into four ponds separated by crushed limestone rock barriers. Water hyacinths are cultured in the first two ponds while the last two ponds are used to permit the regrowth of other plant species and to evaluate the suitability of several fish species for consumption of vegetation produced. Water hyacinths accumulate heavy metals and trace organics from waters with contamination levels below detectable limits. The effluent from the hyacinth ponds is very clear and contains little total nitrogen. For the period June 1975 through January 1976, the average influent to the ponds contained 19 mg/liter BOD5, 70 mg/liter COD, 40 mg/liter total suspended solids, 1.3 mg/liter ammonia, and 14.7 mg/liter phosphate. During the same period, the average total suspended solids, less than 0.1 mg/liter ammonia, and 11 mg/liter phosphate. If the biomass produced in the hyacinth ponds is extrapolated to a one acre basis, then one acre would support a standing crop of an estimated 240 tons wet weight, or 12 tons dry weight and contain an estimated 4,500 pounds of mineral salts, 1,800 pounds of protein, and 16,800 pounds of carbohydrate. (Orr-FIRL)
W76-09437

SEWAGE TREATMENT FACILITY TO BE UPDATED AND EXPANDED AT KITCHENER ONTARIO,
Water and Pollution Control, Vol. 114, No. 1, p 23, January, 1976.

Descriptors: *Sewage treatment, *Treatment facilities, *Activated sludge, Sewers, Equipment, Aeration, Sludge treatment, Chlorination, Construction, Lagoons, Canada, *Waste water treatment.
Identifiers: Treatment facility upgrading, Ontario(Canada).

An extension to the Kitchener Pollution Control Centre facility, Ontario is described, which will bring the rated capacity of the plant from 11.5 million Igpd to 27 million Igpd. The facility is a conventional activated sludge plant with some original units that were built in the middle 1930's. Updating of the plant includes the building of a new overhead trunk sewer to bring raw sewage to the new plant; the demolition of the screen house and its replacement with a new screen and detritor building, capable of treating a peak flow of 43 million Igpd; and the upgrading of primary clarifiers, aeration units, and secondary clarifier units. New tanks are being designed for sludge treatment to mix and heat sludge with hydraulic gas guns. In addition, a new chlorine contact chamber is being added, which will provide a total detention time of 15 minutes a peak load. Other remodelling includes the replacement of the old boiler, the modification of the filter building to incorporate electrical and mechanical workshops, and the replacement of the present sludge lagoon area with a new sludge lagoon. (Kramer-FIRL)

WEED HOLDS PROMISE FOR POLLUTION CLEANUP,
C. Murray.
Chemical and Engineering News, Vol. 54, No. 12, p 23-24, March 22, 1976.

Descriptors: *Sewage treatment, *Waste water treatment, *Water hyacinth, Aquatic plants, Floating plants, Biological treatment, Lagoons, Aquatic weeds, Absorption.

The water hyacinth is being tested as a means of sewage treatment for small towns which can not afford the capital investment necessary with conventional treatment techniques. The water hyacinth is a vascular plant containing a system of vessels that transport nutrients from the roots through the leaves while absorbing large quantities of nutrients and pollutants found in domestic sewage. The hyacinth also has the ability to concentrate heavy metals and organic substances often present in industrial wastes. National Aeronautics and Space Administration (NASA) officials have been conducting research at Bay St.

Louis, Mississippi. In the spring of 1975, three acres of a 40-acre municipal lagoon that receives raw sewage from about 6000 households was planted with water hyacinths. Although three acres was insufficient to clean up the entire lagoon, planting 12 acres of the lagoon with hyacinths in summer of 1976 is expected to produce clean water in the lagoon. Uses for water hyacinths produced are also being explored. In a study at the Mississippi State University agricultural experiment station, hyacinths grown in municipal sewage were dried, ground into meal, and added to cattle feed. The hyacinth meal is high in minerals and protein and comparable to cottonseed meal or soybean meal as a feed supplement. NASA is researching the conversion of water hyacinths into methane by anaerobic fermentation. Residue produced by anaerobic digestion is an efficient fertilizer and soil conditioner. (Orr-FIRL)

CARBON WASTEWATER TREATMENT PROCESS,
Jet Propulsion Lab., Pasadena, Calif.
M. F. Humphrey, W. L. Dowler, and G. M. Simmons.
Public Works, Vol. 107, No. 2, p 62-63, February, 1976. 1 fig.

Descriptors: *Waste disposal, *Sewage sludge, *Recycling, *Activated carbon, Methane, Adsorption, Solids removal, *Waste water treatment.

It formerly was considered cheapest to dispose of sewage sludge. Now sludge can be recycled, producing methane and an activated carbon, used to purify more waste water. Many new processes use activated carbon to absorb contamination with or without chemical coagulating agents. In this new process, after the carbon adsorbs dissolved solids from water, it is recycled back into the untreated sewage and removed along with the sludge. Critical aspects of the process include using primary sludge solids to produce adsorbent carbon char and using it for promoting separation of suspended and settleable solids. After preliminary laboratory investigations of these steps and using the carbon char for removing dissolved solids, a pilot plant was designed, constructed, and placed in operation. The process involves absorbing most of the liquid wastes with the ash and carbon, and drying the mixture more completely and faster than is done in other processes, without adding any chemical agent. The pilot-plant demonstrated the potential to meet or exceed the federal and state requirements for water-disposal quality. Economic studies in progress indicate higher effluent qualities at costs competitive to those of conventional biological processes. (Snyder-FIRL)

COTTONVALLEY -- BRITAIN'S LATEST SEWAGE WORKS.
Water Services, Vol. 80, No. 959, p 49, 51, January, 1976.

Descriptors: *Sewage treatment, *Treatment facilities, Tertiary treatment, Methane, Incineration, Sludge treatment, *Waste water treatment.

The Cottonvalley Sewage Works, now under construction to serve all the needs of the new city of Milton Keynes, is designed to the same standards as other parts of the city as an integral part of the area. The works are expected to eventually serve a population of 275,000, including another town and surrounding villages, and will probably be completed by 1990. The Cottonvalley scheme is believed to be one of the most advanced purification works of its type anywhere in the world. The first of the three phases, designed to serve a population of 117,000, is nearing completion. Methane gas from sludge digestion is the main fuel for the two boilers and the sludge incinerator. When the incinerator is in use, heat from its waste gases is recovered by a heat exchanger for sludge digestion, heating domestic hot water, and space heating; at other times, these functions are assumed by the boilers. Administrative and laboratory areas are air conditioned. Building service are pneumatically controlled from a central panel. (Snyder-FIRL)
W76-09442

SLUDGE/ACTIVATED CARBON CYCLE TREATS SEWAGE.
Industrial Research, p 30, 33, January, 1976. 1 fig.

Descriptors: *Pilot plants, *Activated carbon, *Activated sludge, Recycling, California, *Waste water treatment.
Identifiers: *Pyrolysis.

If a pilot plant achieves projected 25% savings in costs, a new concept in technology for sewage treatment could be extensively used in treatment plants. A pyrolysis unit to manufacture activated carbon, for which sewage solids made a very good raw material, led to the use of the activated carbon produced to further treat waste water. This approach solves a problem common to most municipal sewage plants providing only primary treatment. The new process makes the solids that are normally difficult to dispose of into activated carbon, which is recycled with new solids and reactivated after use. Comparison studies found rotary calciners to be the best approach for the pyrolytic reactor. Data from a pilot plant test were used in designing the calciner being prepared for a million-gallon-a-day pilot plant at Huntington Beach, California. A gas drier is included to take exhaust gases from the burners to a flash drier to dry the filter cake before it goes into the calciner. (Snyder-FIRL)
W76-09443

CRAWLEY SEWAGE TREATMENT WORKS.
Water Services, Vol. 80, No. 959, p 39, January, 1976. 1 tab.

Descriptors: *Tertiary treatment, *Treatment facilities, *Sewage treatment, Biochemical oxygen demand, Suspended solids, Filtration, *Waste water treatment.

A plant for tertiary treatment is operating successfully at Tinsley Green. The treatment works, located near Crawley, was formerly under the control of the Crawley Urban District and now comes within the Thames Water Authority. The ever increasing demands on the original plant made it necessary for further extensions to be built; the tertiary treatment incorporates six gravity filters with equipment for automatic operation. The tertiary treatment plant was designed for dry weather flow of 23.64 million liters per day and peak flow of twice that amount. It was designed to treat sewage effluent already treated to the standards of the Royal Commission to under 10.0 ppm suspended solids and 5 day biochemical oxygen demand (BOD) in summer and under 15.0 ppm in winter. The influent and the final treated effluent were tested during mid 1974; the standards were met. Equipment for sequence control and automatic filter washing was designed to allow automatic washing of the filters when either a predetermined head loss through the filter occurred or a predetermined filter run terminated. (Snyder-FIRL)

OZONE PROVIDES ALTERNATIVE FOR SECONDARY EFFLUENT DISINFECTION. PART 1,
Welsbach Ozone Systems Corporation, Philadelphia, Pa.
C. Nebel, R. D. Gottschling, P. C. Unangst, H. J. O'Neill, and G. V. Zintel.
Water and Sewage Works, Vol. 123, No. 4, p 76-78, April, 1976. 7 fig.

Descriptors: *Sewage treatment, *Disinfection, *Ozone, *Waste water treatment, Tertiary treatment, Treatment facilities, Bacteria, Design criteria, Activated sludge.

Previous work has established that the effectiveness of ozone in secondary sewage effluent disinfection can be considered at several dosage levels. This study investigated the dosages of ozone required for disinfection in order to determine the effectiveness of removal of specific contaminants in the effluent. Secondary effluents were obtained from three types of sewage treatment plants in New Jersey and Pennsylvania--standard activated sludge, contact stabilization, and pilot plant oxygen enriched activated sludge Effluents were ozonized in a 6.5 inch I.D. Plexiglas ozone contact column. Samples were removed at specified times and analyzed for contaminant concentration. The amount of ozone required was found to vary, depending on the exact nature of the effluent. Data showed that the existence of ozone reaction products may be correlated to bacterial kill. A peroxide residual may be calculated as a quasi ozone residual, and may be used for the automatic control of an ozone disinfection system in an application similar to that of the chlorine residual method. DESERT AREA ACTIVATED SLUDGE PLANT.
Public Works, Vol. 107, No. 2, p 86, February, 1976.

Descriptors: *Waste water treatment, *Activated sludge, *Treatment facilities, Slude treatment, Chlorination, Equipment.
Identifiers: Wet air oxidation.

The Indio, California, waste water treatment plant in the Southern California desert serves a population of 25,000 and industry. It includes primary and secondary settling, conventional activated sludge treatment, wet air oxidation of sludge, and chlorination. Diffused air aeration is important to proper operation of the activated sludge treatment process and, due to the high ambient temperatures, capability of the air compressor is more important than is usually true. Peak temperatures require higher air volumes. Two centrifugal blowers for normal operation are powered by electricity, and a third, which serves as a standby, is powered by an engine fueled by natural gas. The only unusual difficulties in nearly 2 yr of operation have been occasional sand storms that cause some problems in the lines. (Snyder-FIRL)

OBJECTIVES AND COSTS OF ADVANCED TREATMENT TECHNIQUES FOR SEWAGE,
Balfour (D.) and Sons, London (England).
G. A. Truesdale, and M. R. G. Taylor.
Berichte der Abwassertechnischen Vereinigung e.V., No. 28, p. 323-332, 1976. 1 fig, 24 ref.

Descriptors: *Waste water treatment, *Tertiary treatment, *Irrigations, *Lagoons, Filtration, Costs, Nitrification, Denitrification, Chemical precipitation, Activated carbon, Ion exchange, Electrodialysis, Reverse osmosis, *Sewage treatment, *Operating costs.

dentifiers: Microstraining.

The uses of the receiving watercourse largely letermine effluent standards. Controling lischarges of suspended solids and oxygen conuming matter is fundametally important. Tertiary reatment is used to meet more stringent standards. Irrigation over grassland is such a process; ffluent is allowed to flow over graded land with a entle slope, then collected. Lagoons are another uch method; deeper lagoons with longer retention imes are more effective. Slow filtration through and is suitable for small works. Rapid sand filtraion uses thicker layers of sand, and the liquid may low either up or down. Microstraining forces effluent through a cylindrical surface of stainless teel fabric, in which solids collect. In gravel bed larifiers, effluent flows upward through a shallow gravel bed. A suitable tertiary treatment process an achieve effluent standards of 10:10. Percolatng filters operating at relatively low biochemical oxygen demand (BOD) loadings normally achieve high a degree of nitrification for ammonia emoval. Biological nitrification followed by lenitrification seems most promising for removing itrogen in the form of nitrate. Alum, lime, or iron alts can remove phosphate by precipitation, ither during primary treatment or as a tertiary rocess. Biological methods can produce effluents vith 5 mg/liter BOD, suspended solids, and ammonical nitrogen, but could probably not meet nore stringent standards. Activated carbon adsorption can remove residual organic matter, but ot inorganic constituents. Ion exchange usually requires activated carbon pretreatment to remove rganic matter, as would electrodialysis. Adding acid to sewage effluent minimizes problems posed by reverse osmosis. Much of the data on costs of these processes is based on limited operating experience. (Snyder-FIRL)
W76-09449

CARBON MADE FROM SEWAGE SOLIDS TREATS WASTEWATER.
Water and Pollution Control, Vol. 114, No. 1, p 31, January, 1976.

Descriptors: *Waste water treatment, *Activated carbon, *Pilot plants, *Sewage treatment, Suspended solids, Heavy metals, Odor, Treatment facilities.
Identifiers: *Pyrolysis, Sewage solids, Activated carbon manufacture.

A pilot plant is being constructed to test a system that uses a pyrolytic reactor for converting solid sewage materials into activated carbon, which then is used to treat incoming waste water. A mobile demonstration unit operated successfully at the sewage treatment plant at Huntington Beach, California, where the pilot plant will be installed. The system, as tested with the mobile unit, virtually eliminated sewage solids, delivered cleaner waste water to the ocean, removed heavy metals from the sewage, and eliminated odors. Design parameters will be determined by the pilot plant for larger facilities processing sewage to meet pending United States envionmental standards. The origin of the process was a pyrolysis unit to manufacture activated carbon. Later it was found that sewage solids were a very good raw material, and the resulting product was suitable for further treatment of sewage. After treating the waste water, activated carbon is recycled with the new sewage solids and reactivated. Eventual extraction of some ash and carbon from the process represents the system's only residue. (Snyder-FIRL)

NITRATES: WHAT'S HAPPENING IN BRITAIN,
Thames Water Authority, London (England).
W. Ray.
Water and Wastes Engineering, Vol. 13, No. 4, p 26-28, 30, 48, April, 1976. 3 fig.

Descriptors: *Nitrogen compounds, *Nitrates, *Denitrification, *Waste water treatment, Activated sludge, Treatment facilities, Nutrient removal, Bacteria.
Identifiers: Facultative heterotrophic bacteria.

Demand for water has increased, resulting in increased use of water from rivers. Increased detergent use and improved techniques for sewage treatment which oxidize ammonia are partially responsible for increases in phosphate and nitrate concentrations in natural waters. The major source, however, is agricultural fertilizer run-off. Nitrates cause most concern in the River Lee, an important tributary of the River Thames. Measures were taken to reduce the nitrate level in the effluent of a major sewage treatment works on the River Lee, at Rye Meads North of London. Laboratory work indicated that an anoxic zone in activated sludge plants could reduce the nitrogen concentration in the final effluent by about 40% under the proper conditions. Plant scale experiments are in progress. Attempts to create an anoxic zone by removing 75% of the diffusers to reduce air action to a level preventing settling were not entirely satisfactory; either some settlement occurred or a slightly greater air flow inhibited anoxic conditions. Substituting a stirring mechanism for the diffusers reduced nitrate from 29 mg/liter to 16 mg/liter in the final effluent. The original design of a new works at Borden, south of London, included denitrification based on these methods. Another new plant being constructed in the River Blackwater Valley near Farnborough provides in its original design for introducing settled sewage upstream of the aerators, creating a zone facilitating denitrification. Both methods are based on nitrate as an oxygen source for various facultative heterotrophic bacteria. Methanol was studied experimentally as a source of carbon for the biological process at Lee Bridge. Nitrate removal rates were consistently 70% to 90%. A new ion exchange process, using heated influent rather than an acid or base solution has been studied but not used commercially. (Snyder-FIRL)

PCS USES STUDY APPROACH FOR EFFLUENT TREATMENT.
Chemical Age, Vol. 112, No. 2950, p 15, January 30, 1976. 1 fig.

Descriptors: *Waste water treatment, *Treatment facilities, Biological treatment, Filtration, Flotation, Sanitary engineering, Bubbles.
Identifiers: Deep Shaft Process, Microflotation.

Pollution Control Systems (PCS) builds effluent plants, provides technical assistance, and studies the economics of treating effluent and recovering materials. PCS uses a set method in approaching effluent problems. First a study involving both field work and analysis is conducted, technically assessing the scale and nature of the problem. A process design team then considers hydraulic levels, pollution levels, and required discharge standards, and proposes a treatment system. Various products for low rate filtration and biofiltration and two treatment systems are currently available from the company. A deep shaft process was developed for biologically treating biodegradable industrial effluent or sewage. It supplies air more efficiently to micro-organisms, significantly increasing treatment rates. The microflotation process, licensed to PCS, couples the benefits from chemical flocculation technology and a simple air bubble generation method for removing suspended solids by flotation. First, oversized solids are removed, the effluent pH is adjusted, and any chemical precipitants required are added. Hydrostatic pressure dissolves air which is injected, aerating the effluent. Reduced hydrostatic pressure later releases the dissolved air as microscopic bubbles which float the stream's solid particles, to which they attach themselves, to the surface. (Snyder-FIRL)

NITRIFICATION STUDIES OF SHIP CHANNEL WATERS,
Texas Univ. at Arlington, Dept. of Civil Engineering.
Y. T. Hung, and W. W. Eckenfelder, Jr.
Water and Pollution Control, Vol. 114, No. 4, p 8-9, 11, 46-47, April, 1976. 4 fig, 2 tab, 5 ref.

Descriptors: *Nitrification, Rivers, Flow, Waste assimilative capacity, Self-purification, Nitrates, Nitrites, Dissolved oxygen, Nitrogen compounds, Texas, Channels, Channel flow.
Identifiers: *Houston Ship Channel(Texas).

A study was conducted on the Houston Ship Channel water to determine the nitrification of channel water samples and the effects of channel flow and degree of treatment on the nitrification process under simulated laboratory conditions. Houston Ship Channel water from various depths was aerated in the laboratory for 20 days and sampled every few days for nitrate and nitrite analysis. Simulation was performed by adding fresh water and waste water to a drum in proportion to the flow in the channel, and sampling before and after each input. Nitrification was not observed in the Houston Ship Channel waters at station Mile 10, the sampling location. This situation might be caused by the absence of dissolved oxygen in the channel waters. Nitrification of water samples taken in August at the same location started on the 12th day of aeration in the laboratory, with a nitrogenous biochemical oxygen demand (BOD) of 9.1 mg/liter. For samples taken in September, nitrification started between the 3rd and 7th days of aeration with a nitrogenous BOD of 0.7 to 1.8 mg/liter. The simulation seems to indicate that the degree of waste treatment increases nitrification, whereas the increase in channel water flow leads to a lesser extent of nitrification. (Snyder-FIRL)

THE WATER INDUSTRY: A REVIEW RELATING TO WASTE WATER TREATMENT,
M. A. Kershaw.
Process Biochemistry, Vol. 11, No. 2, p 37-39, 44, March, 1976. 14 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Tertiary treatment, Ion exchange, Electrodialysis, Reverse osmosis, Fertilizer, Treatment facilities.

The Water Resources Act of 1973 restructured water services in England and Wales to meet increasing demands for water, improve quality of effluent discharges, and protect fisheries and water amenities. In April 1974, 10 regional water authorities replaced 1600 separate bodies. Clean rivers and augmented water supply both depend on sewage and effluent treatment. Many of the actual sewage works inherited from local authorities were grossly overloaded and had worn out equipment. Because of this situation, research on improved waste water treatment is being conducted with a sense of urgency. Continuous monitoring of the stages of waste water treatment is emphasized because of the danger to fish posed by instantaneous discharges. Attempts are also being made to link weather conditions more closely with water treatment. There are many variations in sewage treatment processes, including small prepackaged units. In many instances increasing pressures for improved effluent quality require further stages of treatment, tertiary treatment for effluents already of good quality or advanced treatment, beyond the traditional methods. Advanced treatment methods usually involve further removal of suspended solids, chemical treatment, and removal of organic materials with activated carbon. Methods for removing dissolved salts include ion exchange, electrodialysis, and reverse osmosis. Well-digested sludge that does not contain residual heavy metals can be used as agricultural fertilizer. Automatic control is being used increasingly for routine operations. In some cases, industrial wastes are being recycled into new products. (Snyder-FIRL)

SOLUTION OF THE OPERATING PROBLEMS OF A MODERN SEWAGE TREATMENT PLANT,
J. Finch.
Berichte der Abwassertechnischen Vereinigung e.V., No. 28, p 207-214, 1976.

Descriptors: *Waste water treatment, *Treatment facilities, *Sewage treatment, Aeration, Sludge digestion, *Operations, Performance.

Possible solutions to various water pollution control problems were introduced into a modern sewage treatment plant at Slough, Great Britain, with very satisfactory operational characteristics. The plant uses reinforced fiberglass in the settling tank outlet trough/weirs. An aeration tank with a dynamic baffle-wall performed very similarly to a conventional tank, but cost less to construct. The floating roof type heated sludge digestion tanks were improved by installing a high-density polyethylene pipe line along the peripheral walkway at the top of the tank and blowing gas through spargers inserted between the floating roof and the digester sidewall. Partially dewatered sludge from the heated digestion plant, containing appreciable quantities of phosphorus and nitrogen, is used to fertilize grassland on which beef cattle are grazed. Sludge, soils, crops, and animals are monitored. The increasing demand for water requires improved quality of effluents discharged into rivers. In one instance, improved treatment was achieved by spreading the release of an industrial effluent into the sewage system over a longer period of time. Primary settlement may also achieve a good deal of balancing at the treatment plant. However, there has been little study of incorporating balancing into treatment plant operation. The Slough plant is essentially a high-rate surface aeration unit followed by nitrifying biological filters. It incorporates balancing by extended use of augmented existing storm water tanks to cut off peak flows and store and return them to fill in troughs at low flow. It is easier, more satisfactory, and less expensive to build automation into a process involving balancing. (Snyder-FIRL)

ACTIVATED SLUDGE PROCESS WITH ALUM ADDITION AND HEAT TREATMENT,
Gannett Fleming Corddry and Carpenter, Inc., Harrisburg, Pa.
A. C. Gray, Jr., H. B. Gerber, and P. E. Paul.
Journal Water Pollution Control Federation, Vol. 48, No. 1, p 163-178, January, 1976. 9 fig, 7 tab, 12 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Treatment facilities, Phosphorus, Nutrient removal, Sludge treatment, Polyelectrolytes, Dewatering, *Heat treatment.
Identifiers: *Alum, High-purity oxygen, Sludge conditioning.

Combined high-purity oxygen activated sludge, phosphorus removal by aluminum sulfate precipitation, and thermal conditioning all sludges were studied for Harrisburg, Pennsylvania. Separate on-site pilot systems were used for the oxygen activated sludge and thermal conditioning processes. Treated primary effluent from existing facilities by high-purity oxygen activated sludge, under 2.0 hr aeration time produced 20 mg/liter effluent biochemical oxygen demand (BOD) concentration, even during storm loadings. At 0.5 lb BOD/day lb mixed liquor suspended solids (SS) biomass loading, 1.08 lb total solids/lb BOD removed were produced. An average 1.31 lb oxygen were consumed/lb BOD removed. Solids production varied directly and oxygen consumption inversely with biomass loading. Phosphate was removed to effluent concentrations of 6.0 mg/liter total and 3.0 mg/liter soluble phosphate with aluminum sulfate. About 1.8 mole aluminum ions/mole phosphorus was the optimum dosage, equivalent to adding about 5.6 lb alum/lb influent phosphate. It is necessary to acclimate the biological system to the alum, or the effluent phosphate will increase due to the SS increase. Mean SS concentrations in the effluent were 20 mg/liter before chemical addition at rates of clarifier surface loading between 641 and 694 gal/day/sq ft. Effluent SS increased and observable pin floc formed in the final clarifier after alum addition. For this reason the final design includes polyelectrolyte addition. Thermally conditioning combined sludge increased dewaterability. Filter yields between 3 and 9 lb/day/sq ft and optimum dewatering were compatible. Decant liquor from thermal sludge conditioning did not change effluent quality. While the pilot plant operated, up to 30% of the oxygenation tank's BOD loading was recycled decant liquor. Recycled liquor will probably account for between 10 and 15% of the BOD loading to the oxygenation tanks in the full-scale system. (Snyder-FIRL)
W76-09456

SOME CRITICAL VIEWS OF SELECTED PROCESSES FOR THE BIOLOGICAL TREATMENT OF SEWAGE,
H. J. Schmidt-Holthausen.
Process Biochemistry, Vol. 11, No. 2, p 27-30, March, 1976. 4 fig.

Descriptors: *Activated sludge, Treatment facilities, *Aeration, *Waste water treatment, Oxygen, Bubbles, *Biological treatment, *Sewage treatment.
Identifiers: Aerators, UNOX, Bioxon, Marox, Lindox, High-purity oxygen.

Although the aerated sludge process always uses an aeration tank followed by a final settling tank, there are many variations in the way in which sewage, oxygen, and activated sludge are brought into contact. In two process methods, raw sewage and activated sludge are completely and immediately mixed throughout the tank. One of these uses fine bubble aeration, while the other uses surface aerators. The piston flow feed method also provides complete mixing, but sludge loading decreases and oxygen concentration increases in the direction of flow. Another method feeds return sludge at the inlet end of the tank and sewage and sludge along the lateral sides. The Bioxon process includes incremental sewage feed and tapered feed of air along the lateral sides of the aeration tank. Activated return sludge is fed at the inlet end, resulting in a very high concentration of solids at the front of the tank. This high concentration leads to increased biological activity and metabolism, requiring an increased oxygen demand which is met by tapered aeration. Pure oxygen has been used for aeration in pilot plants. The advantages of using pure oxygen are offset by the disadvantages. The three main methods of using pure oxygen include the Marox process, which uses very fine bubbles and an open tank. The Unox process uses several tanks, and feeds the oxygen from the gas space above one tank to the next tank. The Lindox process uses a blower to recirculate oxygen not used. The most suitable activated sludge process must be selected for each application. (Snyder-FIRL)

REMOVAL OF PHOSPHATE FROM WASTE WATER,
Rockwell International Corp., El Segundo, Calif. (Assignee).
E. V. Kleber, and H. L. Recht.
United States Patent 3,956,118. Issued May 11, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 2, p 728-729, May 11, 1976. 1 fig.

Descriptors: *Waste water treatment, *Chemical precipitation, *Patents, *Phosphates, *Anions, Chemical wastes, Cations, Chemical reactions, Separation techniques, Treatment facilities.
Identifiers: Rare earth cations, Anion removal.

A patent for a chemical treatment process whic removes phosphate-containing anions from wast water is presented. The process involves adding trivalent rare earth cation in soluble form to th waste water to form an insoluble rare eart precipitate of the trivalent rare earth cation an the phosphate-containing anions in the wast water. This precipitate is then separated from th waste water. (Kreager-FIRL)

GIVE STORMWATER POLLUTANTS TH SPIN,
Municipal Environmental Research Lab., Edison N.J. Storm and Combined Sewer Section.
R. I. Field, P. E. Moffa, and J. M. Karanik.
The American City and County, Vol. 91, No. 4, 77-78, April, 1976. 2 fig, 1 tab.

Descriptors: *Sewerage, *Waste water treatment *Overflow, *Combined sewers, Storm water Storm runoff, Flow measurement, Flotation.

A simple swirl regulator controls combined sewe overflows for a Syracuse residential complex concentrating and retaining waste water solid while diverting excess storm water away from th treatment plant. During dry weather, when th flow is below the downstream capacity of the in terceptor, a pump conveys the entire flow to th treatment plant. A flowmeter deactivates th pump when the flow exceeds this capacity. Th waste water then flows by gravity through th swirl chamber, which diverts the storm water i excess of the treatment capacity. The systen reduces settleable solids and floatables over a wide range of overflow rates. Biochemical oxyge demand (BOD) removals greater than 50% and gri reductions up to 90% are achieved. The pump use for dry weather flows would not be necessary i an ideal installation. During overflows, floatable are contained by the scum ring in the outer ring o the chamber and forced into a floatables trap. Dur ing subsequent dry weather, they are drawn down and removed. OPTIMAL GROUND WATER QUALITY MANAGEMENT: WELL INJECTION OF WASTE WATERS,
Cornell Univ., Ithaca, N. Y. School of Civil and Environmental Engineering.
R. Willis.
Water Resources Research, Vol. 12, No. 1, p 47-53, February, 1976, 2 fig, 3 tab, 24 ref.

Descriptors: *Mathematical models, *Aquifers, *Waste water treatment, *Water quality, Water treatment, Cost-benefit analysis, Groundwater, *Injection wells.
Identifiers: *Groundwater quality and quantity model, Minimized surface waste treatment cost.

A mathematical model for optimal conjuctive utilization of the ground water quality and quantity resources of unconfined aquifers was constructed. The saturated zone of the ground water system was considered a component of a regional waste treatment system. The model was designed so as to minimize the cost of surface waste treatment while maintaining acceptable water quality levels throughout the aquifer. Results indicate the feasibility of using secondary waste water treatment (trickling filter) in conjunction with the assimilation capacity of the unconfined aquifer for waste water degradation and disposal. RADIATION FOR A CLEAN ENVIRONMENT.
International Atomic Energy Agency, Vienna (Austria).
STI/PUB/402, Proceedings of a symposium held in Munich on March 17-21, 1975. 672 p.

Descriptors: *Environmental sanitation, *Waste water treatment, Sewage treatment, Sludge, *Radiation, Recycling, Pollutants, Economics, Pilot plants, *Conferences, *Water reuse.

The symposium was sponsored by the IAEA in cooperation with the Government of the Federal Republic of Germany and the Bayerische Landesanstalt fur Bodenkultur und Pflanzenbau. Forty eight papers were presented in eight sessios covering the current technology of waste-water treatment and re-use, radiosensitivity of micro-organisms, disinfection and micro-biological control, physical and chemical modification of aqueous pollutants, technological and economic aspects, pilot plant design and operating experience and radiation of non-liquid wastes. In a panel session the previous sessions were summarized and discussed. (See also W76-09513 thru W76-09556) (Chilton-ORNL)

TYPES AND TREATMENT OF SEWAGE SLUDGES PRACTICE IN THE FEDERAL REPUBLIC OF GERMANY,
Stuttgart Univ. (West Germany). Institut fuer Siedlungswasserbau und Wassergute-wirtschaft.
M. O. Tabasaran.
In: Radiation for a Clean Environment, Proceedings of a Symposium held at Munich, March 17-21, 1975. IAEA-SM-194/101, p 3-18, 3 fig, 2 tab.

Descriptors: *Sewage disposal, *Environmental sanitation, *Sewage treatment, Sludge treatment, Anaerobic digestion, Bacteria, Drying, Inhibitors, *Waste water treatment, *Sewage sludge.
Identifiers: *Germany.

Sewage treatment plants produce sludge which contains small amounts of solids in large amounts of water. The first step in the treatment of this sludge is a de-watering process. Several processes can be used to increase the solid content of the sludge from the usual 5 - 10%; gravity thickening increases to 15%, centrifuging or straining-band-pressing to 30%, and pressure-filtration to 40%. Drying produces an almost moisture free substance. Before de-watering, the sludge may be mixed with coagulating agents, or preheated, or its colloidal components biochemically oxidized. These processes accelerate de-watering. Sludge which is disposed of along with solid refuse in land fills should not be more than 60-70% moisture. Sludge which has been composted with a carbon carrier can be used as a soil improver. Anaerobic alkaline digestion of sludge is the most common process in use. (See also W76-09512) (Chilton-ORNL)

METHODS FOR REDUCING THE INFECTION HAZARD OF WASTE-WATER SLUDGE,
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
J. B. Farrell, and G. Stern.
In: Radiation for a Clean Environment, Proceedings of a Symposium held in Munich, March 17-21, 1975. IAEA-SM-194/102, p19-28, 5 tab, 1 fig, 12 ref.

Descriptors: *Environmental sanitation, *Sludge treatment, Sewage treatment, Sewage disposal, Sludge, Waste water(Pollution), *Infection, Hazards, Irradiation, *Disinfection, *Waste water treatment, Waste water disposal.

The processes in use for stabilizing sludge include anaerobic or aerobic digestion and, for disposal procedures such as disposal to landfills, incineration or disposal to oceans, these processes may be adequate. About 25% of the sludge produced in the United States is used for agricultural purposes and this sludge requires further reduction in the numbers of infectious organisms. Methods for reducing infection hazards are pasteurization, long-term lagooning, thermophilic anaerobic digestion, thermophilic aerobic digestion, and high energy irradiation. The high energy radiation method has several advantages, mainly high reliability, but its greatest disadvantage is its high cost. (See also W76-09512) (Chilton-ORNL)

CURRENT TECHNOLOGY AND ADVANCES IN TRUE RE-USE OF EFFLUENTS,
National Inst. for Water Research, Pretoria (South Africa).
G. G. Cillie.
In: Radiation for a Clean Environment, Proceedings of a Symposium held in Munich, March 17-21, 1975. IAEA-SM-194/103. p 29-43, 7 fig, 8 ref.

Descriptors: *Environmental sanitation, *Water reuse, *Irradiation, Public health, Technology, Disinfection, Waste water treatment, Water treatment.

Water reclamation and re-use is a practical solution to water scarcity in most conditions if adequate precautions are taken in the design and operation of systems to protect public health. Reclaimed water may prove to be a safer and more reliable water supply than those of doubtful origin. Improved radiation technology can ensure complete sterilization and breakdown of organic radicals which may be potentially carcinogenic. The present high costs of radiation and unfavourable economics must be overcome by continuous improvement in nuclear technology. (See also W76-09512) (Chilton-ORNL)

PUBLIC HEALTH ASPECTS OF WASTE-WATER TREATMENT,
Royal Veterinary and Agricultural Coll., Copenhagen (Denmark). Dept. of Veterinary Virology and Immunology.
E. Lund.
In: Radiation for a Clean Environment, Proceedings of a Symposium held in Munich, March 17-21, 1975. LAEA-SM-194/104. p 45-60, 6 tab, 26 ref.

Descriptors: *Environmental sanitation, Waste water(Pollution), *Public health, *Waste water treatment, Pathogenic bacteria, Virusses, Enteric bacteria, Paratitism, Pathology, Disinfection.
Identifiers: Pasteurization.

Reviews are presented of the various bacteria, viruses and parasites found in waste water and polluted waters which are pathogenic to man and the conventional methods for the treatment of these waters. It is concluded that by conventional secondary biological treatment a waste-water may be obtained that contains a very reduced number of pathogens. Chlorination may almost eliminate the bacteria and also influence the amoeba cysts, but the enteric viruses and the parasite eggs are not influenced. In sludges, even after digestion, viruses, some bacteria, and parasite eggs may still be present. Pasteurization may render all these pathogens harmless. (See also W76-09512) (Chilton-ORNL)
W76-09516

RADIATION TREATMENT OF WASTES, A REVIEW,
Atomic Energy Research Establishment, Harwell (England).
F. S. Feates, and D. George.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. LAEA-SM-194/405. p 61-72, 57 ref.

Descriptors: *Environmental sanitation, *Waste treatment, *Irridation, *Reviews, *Ozone, Disinfection, Radiation, Industrial wastes, Sewage sludge.

It has been shown that radiation is effective in degrading organic matter in wastes, destroying pathogenic organisms, and enhancing the sedimentation and filterability of sludges but at an extremely high cost. Since 1973, changes in world energy supplies which affect economic assessments made previously and the environmental hazards of pollution are receiving increased attention so that existing technologies are being re-examined. Ozone produced by gamma-irradiation of air is being used as an alternative to chlorine for sterilization. Radiation presents a possible solution to specific problems associated with industrial wastes. A prototype plant for complete sterilization of sewage sludge in operation. It is seen that there is considerable scope for future work which could affect the economics of radiation treatment. (See also W76-09512) (Chilton-ORNL)
W76-09517

THE NEED FOR THE USE OF HIGH-LEVEL RADIATION IN WATER TREATMENT AND IN WASTE-WATER (SEWAGE) TREATMENT,
Aqueonics, Inc., Los Altos, Calif.
N. E. Nielson.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. LAEA-SM-194/602. p 73-82, 14 ref.

Descriptors: *Environmental sanitation, *Waste water treatment, Water pollution, *Irradiation, Sewage treatment, Gamma rays, Disinfection, *Water treatment.

The need for use of radiation in water treatment is discussed in light of the fact that even after primary and secondary treatments and chemical disinfection, significant quantities of contaminants are still present in sewage. The paper points out that a great deal of energy is required in the use of known techniques for the removal of these contaminants and that a more complex set of conditions must be considered in effective water pollution elimination. Gamma radiation is identified as the most reliable cost-effective, generally efficient technique in the tertiary stages and that its effectiveness can be expanded with the addition of

select chemicals to increase the number of ionizations and/or to capitalize upon surface charge phenomena. (See also W76-09512) (Chilton-ORNL)

VIRUSES AND IONIZING RADIATION IN RESPECT TO WASTE-WATER TREATMENT,
Massachusetts Institute of Technology, Cambridge, Massachusetts, Department of Nutritution and Food Science.
H. S. Lemke, and A. J. Sinskey.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. LAEA-SM-194/203. p 99-120, 7 tab, 8 fig, 73 ref.

Descriptors: *Environmental sanitation, *Waste water treatment, *Radiation, *Viruses, Disinfection, *Ions.
Identifiers: *Ionizing radiation.

A survey is presented on viruses, the diseases they can cause in man, and the effects of ionizing radiation on viruses. In conclusion it was stated that ionizing radiation inactivates viruses by direct and indirect effects. The radiosensitive target is the nucleic acid and the degree of radiosensitivity is affected by temperature and the suspending menstruum. The role of oxygen in radiosensitization of viruses remains unclear. The effective application of radiation treatment of waste-waters requires information on the number of plaque-forming units per ml for dose determination. (See also W76-09512) (Chilton-ORNL)

DISINFECTION OF SLUDGE AND WASTE-WATER BY IRRADIATION WITH ELECTRONS OF LOW ACCELERATING VOLTAGE,
Polymer-Physik G.m.b.H., Co., Kg., Tuebingen (West Germany).
P. Holl, and H. Schneider.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/301. p 123-138, 7 fig, 8 tab, 9 ref.

Descriptors: *Environmental sanitation, *Waste water treatment, *Irradiation, *Sludge treatment, Costs, Disinfection.
Identifiers: Low accelerating voltage, *Electron accelerator.

The use of natural ionizing radeation or electron radiation of high accelerating voltage has encountered some opposition because the radiation cannot be stopped, and the investment cost of electron accelerators having an accelerating voltage of more than 1 MV is very high. These disadvantages may be overcome by using an electron accelerator of low accelerating voltage. Agitation of the substrate during irradiation allows a thick layer of sludge to be irradiated. The advantages of this method are less costly radiation shielding, complete absorption of the radiated energy by the substrate, and low investment and operating cost. The sterilizing effect of the process is produced by secondary reactions that take place in the water in addition to the primary reactions. (See also W76-09512) (Chilton-ORNL)

TREATMENT OF SEWAGE SLUDGE WITH COMBINATIONS OF HEAT AND IONIZING RADIATION (THERMORADIATION),
Sandia Labs., Albuquerque, N. Mex.
H. D. Sivinski.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/303. p 151-167, 16 fig, 32 ref.

Descriptors: *Environmental sanitation, *Sewage treatment, *Sludge treatment, *Irradiation, Heat, Time, *Heat treatment, Waste treatment, Pathogenic bacteria.
Identifiers: *Thermoradiation, Synergism, Sewage pathogens.

This research deals with inactivation of sewage pathogens by means of heat and ionizing radiation (gamma) applied singly and thermoradiation, heat and ionizing radiation applied simultaneously. The data indicated treatment time at temperature can be reduced with ionizing radiation or radiation dose can be reduced significantly by adding heat. When thermoradiation combinations are properly chosen, synergism is observed with aerobic and anaerobic spores, vegetative cells, viruses and enzymes which can result in up to 30-fold reduction in treatment times. (See also W76-09512) (Chilton-ORNL)
W76-09523

SYNERGISTIC EFFECTS OF IRRADIATION OF WASTE-WATER.
Florida Inst. of Tech., Melbourne. Univ. Center for Pollution Research.
D. D. Woodbridge, P. C. Cooper, A. J. Van den Berg, H. D. Musselman, and H. N. Lowe.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/304. p 169-189, 20 fig, 2 tab, 10 ref. DAAK-02-71-C-0296.

Descriptors: *Environmental sanitation, *Waste water treatment, *Irradiation, Aqueous solutions, Bacteria, *Bactericides.
Identifiers: Synergism, Hydrated electron.

A mathematical/statistical analysis of the data indicates that irradiation kills bacteria more readily in a large aqueous environment than in a normal radiation chamber. These results can be best explaned by the creation of the hydrated electron which acts as a highly reactive negative ion. The reducing effects of this ion can account for many of the organic and inorganic reactions observed in aqueous solutions. Comparison of the effectiveness of irradiation on a solution of buffered distilled water containing bacteria and secondary effluent showed a shielding condition with the more turbid effluent. Small amounts of chlorine in the effluent appeared to produce a reduction in the effectiveness of the irradiation but large doses of chlorine produced a definite synergistic effect. GAMMA IRRADIATION FOR SEWAGE TREATMENT AT US ARMY FACILITIES,
Army Facilities Engineering Support Agency, Fort Belvoir, Va. Research and Technology Div.
A. J. Van den Berg, H. D. Hollis, H. D. Musselman, H. Lowe, and D. D. Woodbridge.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/305. p 191-196, 12 ref.

Descriptors: *Environmental sanitation, *Sewage treatment, *Irradiation, Radioisotopes, Gamma rays.
Identifiers: *Synergism, Electron accelerators.

Initial investigations in the laboratory assessed the effects of gamma radiation from a cobalt-60 source on fecal coliform, M-pyogenes and M-smematis organisms and on such common constituents of sewage as phenol, surfactants, and pesticides. Current research uses effluent from a municipal sewage plant and substitutes fecal streptococcus for M-smegmatis as a test organism. The previously noted synergistic effect of chlorine was achieved only in the presence of relatively large concentrations of chlorine at tthe time of irradiation. The work is directed toward the effects of gamma irradiation alone and in combination with chlorine and oxygen on sewage sludge and on the cyst stage of protozoa. High-energy radiation from isotopic sources or from electrically powered accelerators would be equally effective but isotopic sources are recommended for installations the size of US Army posts. SCOPE FOR UTILIZING GAMMA RADIATION FOR MICROBIOLOGICAL CONTROL OF SEWAGE WASTE-WATER IN INDIA,
Bhabha Atomic Research Centre, Bombay (India). Biochemistry and Food Technology Div.
N. F. Lewis.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/307. p 197-202, 1 tab, 2 fig, 10 ref.

Descriptors: *Environmental sanitation, *Waste water treatment, *Irradiation, Agriculture, Gamma rays, Sewage treatment, Water reuse.
Identifiers: *India.

In sewage treatment plants in India, conventional methods of treatment are used, the secondary effluent is emptied into the sea or, after treatment with chlorine, may be used for land irrigation. However, these methods do not adequately render the effluent safe for agricultural use. The secondary effluent has a comparatively low microbial count and preliminary studies indicate that radiation doses in the range of 0.1-0.3 Mrad would suffice for elimination of pathogens. The dose of radiation required can be reduced several fold if irradiation is carried out in the presence of certain chemicals. (See also W76-09512) (Chilton-ORNL)
W76-09526

SANITARY EFFECT OF GAMMA IRRADIATION ON SEWAGE SLUDGE,
Zurich Univ. (Switzerland). Veterinary Bacteriological Inst.
E. Hess, and C. Breer.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/308. p 203-308, 4 fig.

Descriptors: *Environmental sanitation, Sewage treatment, Irradiation, *Pathogenic bacteria, *Salmonella, Bacteria, Sewage sludge, Gamma rays, Enteric bacteria.
Identifiers: Pasteurization.

It was found that neither aerobic stabilization nor anaerobic digestion significantly reduced sludge contamination with Salmonellae which was present in more than 90% of the samples. Salmonellae in sewage sludge spread on grass survived up to 72 weeks. In a model experiment of the sanitary effect of pasteurization and gamma irradiation, 259 samples from 44 different sewage disposal plants were examined. A linear reduction of Enterobacteria was found with increasing doses of gamma radiation. The sanitary effect of gamma irradiation with 300-350 krad was equivalent to the effect of heat treatment by pasteurization. (See also W76-09512) (Chilton-ORNL)
W76-09527

ATA ON THE DISINFECTION OF LIQUID IANURE BY GAMMA IRRADIATION AT AJA, HUNGARY,
eterinary Sciences Univ., Budapest (Hungary).
Simon, and G. Tamasi.
n: Radiation for a Clean Environment, roceedings of a symposium held in Munich, larch 17-21, 1975. IAEA-SM-194/306. p 209-216, fig, 2 tab, 13 ref.

escriptors: *Waste treatment, *Farm wastes, Irradiation, Aerobic bacteria, Anaerobic bacria, Salmonella, Clostridium, *Disinfection.
lentifiers: Radiosterilization, *Hungary.

he disinfection of liquid manure by gamma irdiation was investigated. Aeration of the sample id not increase the effectiveness of the adiosterilization treatment. No great differences ere observed in the radiosensitivity of the aeroic and anaerobic microbes. Aerobic spores were ore sensitive than the vegetative Clostridia. elatively low radiation doses were needed to liminate Salmonellae in liquid manure. Gamma terilization cannot be used as a practical operaon against Mycobacteria because too high radiaon doses are needed for the total elimination of ese micro-organisms. QUEOUS RADIATION CHEMISTRY IN RELATION TO WASTE TREATMENT, AN INTRODUCTORY REVIEW,
Edgenoessische Technische Hochschule, Zurich Switzerland). Inst. for Aquatic Sciences and Water Pollution Control.
. Hoigne.
n: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/401. p 219-232, fig, 2 tab, 24 ref.

Descriptors: Chemistry, *Radiation, Waste treatment, Chemical reactions, Radiation.
dentifiers: *Radiation chemistry.

Because of possible competing reactions, the adiation sequences initiated by radiation do not roduce efficient pathways for solving chemical roblems in waste treatment. The reagents formed y the primary radiolytic species are too expensive o compete with conventional chemical reagents. Radiation chemistry is of interest in discussing waste problems because of its contribution to knowledge about reaction kinetics in water and because chemical effects are the basis of biological effects caused by radiation. (See also W76-09512) (Chilton-ORNL)

RADIATION CHEMICAL DESTRUCTION OF PHENOL IN OXYGENATED AQUEOUS SOLUTIONS,
Institut za Nuklearne Nauke Boris Kidric, Belgrade (Yugoslavia).
D. I. Micic, M. T. Nenadovic, and V. M. Markovic.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/402. p 233-239, 1 fig, 1 tab, 20 ref.

Descriptors: Chemistry, *Chemical degradation, Organic compounds, *Phenols, Radiation, Aqueous solutions, *Oxygenation.

The purpose was to study the reaction mechanism of phenol decomposition in irradiated aqueous solution to obtain information necessary to evaluate the applicability of this method to processing phenol waste-waters. The study showed the possibility of a significant increase in the phenol decomposition yield in aqueous solutions. The low dose rate, high phenol concentrations and presence of oxygen are conditions under which the chain reaction occurs and result in high decomposition yield, up to several hundreds. Because of the concentration dependence of G(-phenol) the method can only be used for a relatively low factor of destruction. The presence of other organic compounds probably has no significant influence on the decomposition yield but inorganic ions terminate the chain reaction. A very low dose rate has to be used and this necessitates a long treatment time. (See also W76-09512) (Chilton-ORNL)
W76-09530

EFFECTS OF GAMMA RADIATION FROM CO60 ON DILUTE AQUEOUS SOLUTIONS OF LINEAR ALKYL SULFONATE SURFACTANTS AND OTHER ORGANIC POLLUTANTS,
Florida Inst. of Tech., Melbourne.
D. M. Rohrer.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/404. p 241-248, 3 fig, 17 ref.

Descriptors: *Biodegradation, Chemistry, *Chemical degradation, *Radiation, Organic compounds, Surfactants, *Linear alkylate sulfonates, Detergents, Pesticides, Cobalt radioisotopes.
Identifiers: *Cobalt-60.

Linear Alkyl Sulfonate Surfactants are considered biodegradable but the time required for biodegradation is impractical within the present environmental guidelines. The paper presents research findings on alternate techniques of treatment for the destruction of Linear Alkyl Sulfonate Surfactants. The effect of radiation on the surfactant solution was greatly affected by the initial concentration of the test solution. Solutions of greater concentrations than 15 mg/l gave erroneous results due to the small amount of dissolved oxygen available within the fluid. Data indicated that while there was a small increase in the destructive powers of the gamma radiation at lowered dose rates the increase was not significant from a treatment standpoint. In studying the effects of ionizing radiation on pesticides, it was found that there was a reduction in ethyl parathion concentrations of 26% at the end of 8 hours irradiation and of 32% after 24 hours. A substantial ability for radiochemical destruction of this pesticide was indicated. (See also W76-09512) (Chilton-ORNL)
W76-09531

EFFECTS OF GAMMA IRRADIATION ON THE DEGRADATION OF DYES,
Politecnico di Torino (Italy). Instituto di Chimica Industriale.
N. Piccinini, and F. Ferrere.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/407. p 249-264, 3 tab, 6 fig, 24 ref.

Descriptors: Chemistry, *Chemical degradation, *Irradiation, Gamma rays, Organic compounds, *Dyes, Biodegradation.

The effects of gamma irradiation versus the dose, the dye concentration, the pH and the oxygen content of aqueous solution of several classes of dyes was investigated. Anthraquinonic dyes were irradiated in a wide range of doses up to 5 Mrad. It was found that the decolorization process with gamma radiation occurs by radical reactions caused mainly by primary radiolytic species. The highest degradation yields were obtained at low doses and high concentrations; the dissolved oxygen develops a synergic effect and the pH conditions differently influence the degradation according to the dye type. The degradation is associated with oxidation processes and enhanced by solution aeration. (See also W76-09512) (Chilton-ORNL)
W76-09532

POSSIBLE USE OF HIGH-LEVEL RADIATION FOR THE DEGRADATION OF SOME SUBSTANCES PRESENT IN URBAN AND INDUSTRIAL WATERS,
Palermo Univ., Italy, Istituto di Applicazioni e Impianti Nucleari.
C. Cappadona, P. Guarino, E. Calderaro, S. Petruso, and S. Ardica.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/408. p 265-284, 6 fig, 6 tab, 11 ref.

Descriptors: *Waste water treatment, *Chemical degradation, Pollutants, Gamma rays, Organic compounds, *Irradiation, Dyes, Pesticides, Solvents, Industrial wastes.

Tests were conducted on solutions or suspensions of organic solvents, dyes, pesticides and chlorophenols in static and in dynamic aerated systems using commercial products immersed in liquids drawn from industrial waters. Treatment with gamma radiation caused a degradation of these substances which was related to pH, oxygenation and composition of the medium and to the mixture of commercial products. It was generally concluded that benefits from the use of ionizing radiation in the ecological field will be dependent upon the cost of plant and radioactive sources. (See also W76-09512) (Chilton-ORNL)
W76-09533

DEGRADATION OF PERSISTENT ORGANOCHLORINE POLLUTANTS BY GAMMA RADIATION AND ITS POSSIBLE USE FOR WASTE-WATER TREATMENT,
Gesellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg bei Munich (West Germany). Institut fuer Okologische Chemie.
L. Vollner, H. Rohleder, and F. Korte.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/409. p 285-296, 6 fig, 2 tab, 10 ref.

Descriptors: *Environmental sanitation, *Waste water treatment, Pollutants, Organic compounds, Gamma rays, *Radiation, Chemical degradation.

Radiation yield and degradation chemistry of some organochlorine pesticides, polychlorinated biphenyls and related chemicals subjected to gamma radiation were investigated. It was found that the pattern of hexane extractable compounds obtained from acetone-water and from pure water solutions are not very different when compared by GC-analysis; no distinct main degradation product was detectable in any of the investigated solute-solvent systems but a number of compounds formed simultaneously; and dechlorination and dehydrochlorination were found to be the most important mechanisms of the first attack. Persistent polychlorinated compounds in solution were found to be affected by gamma radiation and if the radiation dose is high enough, these compounds are totally decomposed. (See also W76-09512) (Chilton-ORNL)
W76-09534

COMPARISON OF THE CHEMICAL EFFECTS OF OXONE AND OF IRRADIATION ON ORGANIC IMPURITIES IN WATER,
Edgenoessische Technische Hochschule, Zurich (Switzerland). Inst. for Aquatic Sciences and Water Pollution Control.
J. Hoigne.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/410. p 297-305, 3 fig, 1 tab, 21 ref.

Descriptors: *Environmental sanitation, *Waste water treatment, *Irradiation, Chemical degradation, Gamma radiation, *Ozone, Oxidation.

In either radiation or ozone treatment of aqueous oxygenated solutions the hydroxyly radicant can become the main species for the oxidation of organic impurities. The oxidizing intermediate produced by ozone was identified by comparing its reaction selectivities with those known for the hydroxyl radicals initiated by high-speed irradiation. From cost comparisons of the two methods it was concluded that ozone is a much cheaper oxidant than radiation and that radiation has to provide other advantages if it is to be considered as an oxidant for the removal of dissolved organics in waste waters. (See also W76-09512) (Chilton-ORNL)
W76-09535

ALTERNATIVE HIGH-LEVEL RADIATION SOURCES FOR SEWAGE AND WASTE-WATER TREATMENT,
Division of Biomedical and Environmental Research (USERDA), Washington, D. C.
D. S. Ballantine.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21 1975. IAEA-SM-194/501. p 309-323, 4 tab, 5 fig, 9 ref.

Descriptors: *Environmental sanitation, *Waste water treatment, *Radiation, Gamma rays, Radioisotopes, Cost-Benefit analysis, *Sewage treatment.
Identifiers: Electron accelerators.

An electron accelerator or a gamma-ray source of radioactive cobalt or caesium are the present choices of an energy source for the radiation treatment of waste-water or sludge. Several factors will affect the ultimate choice and the potential future adoption of radiation as a treatment technique. The paper reviews these factors and emphasizes the following points: (1) Gamma-ray sources offer advantages of deep penetration capability and adaptability to a variety of geometries; (2) accelerators are characterized by low penetration capability, high dose rates and inflexibility to facility design; (3) the supply of radiosotopic power is contingent upon the growth of nuclear power plants and fuel separation plants; (4) accelerators offer a six- to ten-fold advantage in initial capital cost and a two-fold advantage in overall operating cost and could provide unlimited radiation power; and (5) applications will be limited to areas that can tolerate costs in the range of $1-2 / 1000 gallons. (See also W76-09512) (Chilton-ORNL)

USE OF HIGH-POWER ELECTRON BEAM RADIATION FOR THE TREATMENT OF MUNICIPAL AND INDUSTRIAL WASTES,
Radiation Dynamics, Inc., Westbury, N. Y.
M. R. Cleland, J. P. Farrell, R. L. Malnati, and K. H. Morganstern.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. LAEA-SM-194/502. p 325-342, 6 fig, 3 tab, 1 append, 17 ref.

Descriptors: *Environmental sanitation, *Waste water treatment, *Radiation, Industrial wastes, Costs, Municipal wastes, Water quality.
Identifiers: Electron accelerators.

The technology involved in the recent development of electron beam accelerators can be applied to the irradiation of waste materials. These accelerators can provide 150 kW of useful beam power for continuous service and could process 3.1 million gallons daily of water to an average dose of 0.1 Mrad at a unit cost of about $0.22 per 1000 gallons. Systems for large-scale application delivering up to a megawatt of power would further reduce the radiation processing cost and increase the capacity to about 22 million gallons daily. While the cost would not be competitive with conventional treatment methods, the improved quality of the effluent material and the reduced burden on the environment may justify the use of this kind of radiation in advanced waste treatment processes. (See also W76-09512) (Chilton-ORNL)

PROSPECTS FOR HIGH-ENERGY ELECTRON IRRADIATION OF WASTE-WATER LIQUID RESIDUALS,
Massachusetts Inst. of Tech., Cambridge.
J. G. Trump, K. A. Wright, E. W. Merrill, A. J. Sinskey, and D. Shah.
In: Radiation for a Clean Environment, Proceeding of a symposium held in Munich, March 17-21 1975. LAEA-SM-194/503. p 343-354, 5 fig, 17 ref.

Descriptors: *Environmental sanitation, *Waste water treatment, *Radiation, Radioisotopes, Safety factors, Costs.
Identifiers: *Electron accelerators.

A proposal is presented to set up a high-energy electron research facility at Boston's MDC wastewater treatment plant. The system, powered by a commercial 50kW electron accelerator, could treat 100 kilogallons of selected materials to a dose of 400 kilorads daily. The penetration, irradiation time, safety, flexibility and availability of the ionizing energy produced by electron accelerators is compared to that from radioisotopes. High-energy electrons from machine source are believed to possess the greatest advantages in safety, adequacy and economy for waste treatment. (See also W76-09512) (Chilton-ORNL)
W76-09538

AN ELECTRON ACCELERATOR WITH ELECTRONS OF LOW-ACCELERATING VOLTAGE FOR IRRADIATING SEWAGE SLUDGE AND WASTE WATER,
Polymer-Physik G.m.b.H., Co., Kg., Tuebingen (West Germany).
P. Holl, and H. Schneider.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21 1975. LAEA-SM-194/506. p 355-358, 3 fig.

Descriptors: *Waste water treatment, *Irradiation, Sewage treatment, Sludge treatment, Sewage sludge.
Identifiers: *Electron accelerators.

An accelerator with high-vacuum insulation and an operating voltage of 400 kV is described. The high-voltage strength of an accelerator is achieved by the interposing of screen cylinders maintained on definite potentials by resistors. Insulating pressure gas is not required. Findings have shown that such beams will be sufficient to irradiate liquid materials if the sewage sludge or waste water is mixed thoroughly during the irradiation process. (See also W76-09512) (Chilton-ORNL)

PRACTICAL ASPECTS OF THE PASTEURIZATION OF SEWAGE SLUDGE BY ELECTRON IRRADIATION,
Allgemeine Elektricitaets-Gesellschaft, AEG-Telefunken, Hamburg (West Germany).
M. Tauber, E. G. Hofmann, and B. P. Offermann.
In: Radiation for Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/509. p 359-366, 4 tab, 1 fig, 5 ref.

Descriptors: *Environmental sanitation, *Sewage treatment, *Irradiation, Safety, Economics, *Disinfection, Waste treatment.
Identifiers: *Electron accelerators, *Pasteurization.

Investigations have shown that radiation pasteurization is the most preferable treatment for disinfection of sewage sludge. Irradiation doses in the region of 200 krad achieve high degrees of bacterial disinfection and the filterability increases with this method. It is stated that radioisotope sources are considered to be neither economic or safe. The practical aspects of commercial process lines for electron irradiation are considered in terms of the effectivity of the electron radiation process, limited penetration of electrons into material, beam power of electron accelerators, safety aspects, economics, and environmental aspects. (See also W76-09512) (Chilton-ORNL)
W76-09540

FISSION PRODUCT GAMMA-RAY SOURCES AS AN ALTERNATIVE TO COBALT-60 SOURCES FOR SEWAGE SLUDGE STERILIZATION,
Eidgenoessisches Institut fuer Reaktorforschung, Wuerenlingen (Switzerland).
V. R. D. Herrnberger.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/505. p 367-389, 8 fig, 10 tab, 13 ref.

Descriptors: *Environmental sanitation, *Sewage treatment, Sludge treatment, *Gamma rays, *Irradiation, Disinfection, Costs, Cobalt radioisotopes, Sewage sludge, *Waste water treatment.
Identifiers: *Cobalt-60.

The types of sources considered as alternatives to Co 60 for sterilization of sewage sludge were spent fuel elements, mixtures of solidified fission products, and isolated solidified fission products such as Cs 134,137. Costs of these types is compared to Co 60 costs for specific plants. The results indicate that the profitability of fission products as gamma sources cannot be questioned when compared with Co 60. Results depend on encapsulation costs and on the amount of self-absorption losses. The integrated facilities and caesium versions appear to be most attractive from the viewpoints of cost and safety. (See also W76-09512) (Chilton-ORNL)
W76-09541

COSTS AND HYGIENIC NECESSITY OF SEWAGE SLUDGE PASTEURIZATION IN SWITZERLAND,
Edgenoessische Technische Hochschule, Zurich (Switzerland). Inst. for Aquatic Sciences and Water Pollution Control.
W. Obrist.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/507. p 391-397, 2 tab, 3 fig, 4 ref.

Descriptors: *Environmental sanitation, *Sewage treatment, Sludge treatment, Disinfection, *Costs, Public health, Sewage sludge, Waste treatment, Heat treatment.
Identifiers: *Switzerland, *Pasteurization.

Cost factors of six different plants using heat treatment methods for pasteurization of sewage sludge were determined. Data indicated the specific cost figures were between S.Fr. 3.- and 14.- per cubic metre, depending mainly on capacity and actual output of the plant. In the question of the necessity of pasteurization, energy, economic and ecological aspects were considered. It was stated that stabilized but not disinfected wastewater sludges may be applied to crop land and intensive farming throughout the year after harvesting and to grassland during the winter season. Only in regions with predominantly grassland agriculture may pasteurization of sludge be generally introduced. (See also W76-09512) (Chilton-ORNL)

HE WASTE-WATER AND SLUDGE RE-USE ROJECT BY GAMMA IRRADIATION AT ECSKEMET, HUNGARY, SOME APROACHES AND INVESTIGATIONS,
hylaxia Vaccine and Feedstuff-Producing Enterise, Budapest (Hungary).
. Simon, F. Gacs, and A. Urban.
n: Radiation for a Clean Environment, roceedings of a symposium held in Munich, larch 17-21, 1975. IAEA-SM-194/603. p 411-417, fig, 2 tab, 4 ref.

Descriptors: *Sanitary engineering, *Waste water reatment, *Sludge treatment, *Irradiation, Disinection, Gamma rays,.Water reuse, Gamma rays, Cobalt radioisotopes.
dentifiers: Hungary, Cobalt-60.

Before the start of the gamma radiation project, he waste-water samples were found to be positive n regard to Salmonella bacteria and to Staphylococcus aureus, Pseudomonas aeruginosa nd bacteria from the Proteus group. After irradiaion the samples were investigated and generally it vas established that, parallel with the increasing lose of Co 60 gamma radiation, the values of the nvestigated parameters(biological, bacteriological nd chemical) decreased significantly. The most ignificant reduction was found in the numbers of nyco-bacteria, faecal coliforms, and in the Pseudomonas aeruginosa. The irradiation facility combines the advantages of continuous operation vithout dead time with a high utilization factor of he energy emitted and a proposed good nomogeneity of the irradiation. (See also W76-09512) (Chilton-ORNL)

PILOT PLANT EXPERIENCE IN THE TREATMENT OF INDUSTRIAL AND MUNICIPAL WASTE-WATER BY MEANS OF RADIATION-INDUCED OXIDATION,
nternational Purification Systems, Inc., Atlanta, Ga.
W. C. Hay.
n: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/601. p 433-446, 7 tab, 2 fig, 3 ref.

Descriptors: *Environmental sanitation, *Waste water treatment, Radiation, *Oxidation, Bacteria, Recycling, Chemical oxygen demand, Biochemical oxygen demand, *Pilot plants, Disinfection, *Irradiation, Treatment facilities.

The pilot plant utilizes the principle of adsorption of organics from waste-water to activated carbon and dynamic regeneration of the carbon by radiation induced oxidation. Operations of a pilot plant designed and constructed to process wastewater bearing an organic concentration of 100 ppm at a flow rate of 5000 gallons daily required strict adherence to and consideration of the design capacity. Variations in flow rate must be made in direct proportion to the organic contents of the wastewater. COD and BOD reduction, colour and odour elimination were found to be directly related to the quantity of dissolved oxygen in the waste-water and the radiation dose. Bacteria kills ranged above 95% with the coliform bacteria kill being 99%. The primary goal of the work was to reduce COD, BOD and bacteria content to a level acceptable for discharge into navigable waters but it was found that the process yields a water product suitable for recycle. (See also W76-09512) (Chilton-ORNL)

EXPERIENCE WITH A PILOT PLANT FOR THE IRRADIATION OF SEWAGE SLUDGE; DESIGN, OPERATION EXPERIENCE AND COST CALCULATIONS AFTER 18 MONTHS OF CONTINUOUS RUNNING,
Planungs-und Betriebsbure des Abwasserverbandes Ampergruppe, Eichenau (West Germany).
T. Lessel, H. Motsch, E. Hennig, A. Suess, and A. Rosepule.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/604. p 447-464, 4 tab, 9 fig, 6 ref.

Descriptors: *Environmental sanitation, *Waste water treatment, *Irradiation, *Pilot plants, *Sewage treatment, Design, Operations, Costs, Performance, Treatment facilities, Sewage sludge.

Although the plant was intended to carry a daily load of 150 cubic meters of sludge to be irradiated at a dose of 300 krad, for testing purpose the load has been only 30 cubic meters per day. Difficulties were encountered with dirt accumulating in the filter of the cooling circuit and with the formation of chemical deposits in the plant. Significant alterations were made and a regular weekly rinsing to prevent the dirt accumulation is carried out. Results show that the plant can be operated economically as compared with heat treatments and without specially trained personnel. (See also W76-09512) (Chilton-ORNL)

DOSIMETRY AT A HIGH-ACTIVITY CO60 WASTE TREATMENT FACILITY,
Gellschaft fuer Strahlen- und Umweltforschung m.b.H., Neuherberg bei Munich (West Germany).
Institut fuer Strahlenschutz.
D. F. Regulla, G. Schurmann, and A. Suess.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/605. p 465-476, 11 fig, 1 tab, 6 ref.

Descriptors: *Environmental sanitation, *Waste treatment, *Irradiation, Radioisotopes, Treatment facilities, Cobalt radioisotopes.
Identifiers: Dosimetry, *Cobalt-60.

The pilot study was performed at a radiation waste treatment facility which used a 150 kCi Co60 source. The dosimetry problem arose from the radiation field being highly discontinuous in dose-rate and unknown with respect to the effective photon energy distribution. Difficulties also existed in determining the degree of dose homogeneity over the whole sludge filling and the fact that the dose meters passed a turbo pump. The discoloration of silver-activated metaphosphate glass was the method used for the dosimetry program and for purposes of energy-independent reference dosimetry, a TL technique using lithium was employed. Both systems were checked against a chemical dose meter on an iron sulfate basis for control purposes. (See also W76-09512) (Chilton-ORNL)

EXPERIENCE WITH A PILOT PLANT FOR THE IRRADIATION OF SEWAGE SLUDGE, BACTERIAL AND PARASITOLOGICAL STUDIES AFTERIRRADIATION.
Institut fur angewandte Hygiene, Munich (West Germany).
I. Wizigmann, and F. Wursching.
In: Radiation for a Clean Environment, Proceedings of a symposium held at Munich, March 17-21, 1975. IAEA-SM-194/606. p 477-484, 5 tab, 7 ref.

Descriptors: *Environmental sanitation, *Sewage treatment, *Waste treatment, *Irradiation, Radioisotopes, Bacteria, Disinfection, *Parasitism, *Pilot plants, Bactericides, Sewage sludge, Treatment facilities.

Mechanical-biological treatment of sewage sludge reduced the total bacterial count and that of the Enterococces by 2 log and the Enterobacteria by 3 and 4 log. In 25 unirradiated samples of digested sludge, Salmonella was present in 16. With irradiation, further reduction of viable micro-organisms was attained. Of 40 samples, after irradiation 38 were free of Salmonella. The results of the model experiments showed that susceptibility of micro-organisms varies with different species. In parasitological experiments, after irradiation no visible microscopic change was found in the eggs of Ascaris suum. Segmentation was delayed and further development of the egg ceased after the morula formation. Segment outlines were hazy after three weeks of incubation and the segments themselves showed degenerative changes. (See also W76-09512) (Chilton-ORNL)

EXPERIENCE WITH A PILOT PLANT FOR THE IRRADIATION OF SEWAGE SLUDGE, EXPERIMENTS ON THE INACTIVATION OF VIRUSES IN SEWAGE SLUDGE AFTER RADIATION TREATMENT,
Landesuntersuchungsamt fuer das Gesundheitswesen Sudbayern, Munich (West Germany).
C. Epp.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/607. p 485-490, 3 tab, 13 ref.

Descriptors: *Environmental sanitation, *Waste treatment, *Sewage treatment, *Irradiation, *Pilot plants, *Viruses, Disinfection, Sewage sludge, Treatment facilities.

Depending on the time of the year samples were taken, the presence of one or more virus types was found in impure sewage water. Viruses were determined eight times with 33 digested sludge samples before hygienization and twice with the 33 samples after hygienization. One radiation volume was infected with attenuated polio virus type I packed into capsules. After hygienization, the capsules were recovered and the virus content was found to have been reduced more than 90%. (See also W76-09512) (Chilton-ORNL)

EFFECTS OF GAMMA RADIATION AT PILOT PLANT LEVEL COMPARED WITH THE EFFECTS OF PASTEURIZATION ON THE DEWATERING OF SEWAGE SLUDGE,
Association Euratom-ITAL, Wageningen (Netherlands).
A. F. Groneman.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/608. p 491-502, 4 tab, 3 fig, 12 ref.

Descriptors: *Waste treatment, Chemical properties, Physical properties, Sludge, Filtration, *Irradiation, Disinfection, Sewage sludge, *Pilot plants, Treatment facilities, *Dewatering, Gamma rays.
Identifiers: *Pasteurization.

Results of this investigation indicated that gamma irradiation considerably improved the dewatering characteristics of two anaerobically digested sludges. The specific resistances of sludges were significantly reduced by 300 krad of gamma irradiation in laboratory experiments as well as in full-scale experiments. Information obtained from filterability tests was confirmed by plant operators. The conditioning effect of gamma radiation persisted for more than 20 days, indicating permanent changes in the physical-chemical sludge properties that govern the dewatering of sludge. Pasteurization deteriorated dewatering characteristics, increasing the specific resistance to values that were roughly four times as high as the values in irradiated sludge. EXPERIENCE WITH A PILOT PLANT FOR THE IRRADIATION OF SEWAGE SLUDGE, RESULTS ON THE EFFECT OF DIFFERENTLY TREATED SEWAGE SLUDGE ON PLANTS AND SOIL,
Bayerische Landesanstalt fuer Bodenkultur Pflanzenbau und Pflanzenschutz, Munich (West Germany).
A. Suess, A. Rosopule, H. Borchert, T. Beck, and J. Bauchhenss.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/609. p 503-533, 9 fig, 14 tab.

Descriptors: *Environmental sanitation, *Waste treatment, Sewage sludge, *Irradiation, Heat treatment, Soils, Plant physiology, Treatment facilities.

Experiments indicated that the treatment of sewage sludge may be less important than soil properties and water capacity. Greenhouse studies indicated that there is a slightly better effect from irradiated sludge than from untreated sludge but that heat-treated sludge gives a decrease of desireable effects. Smaller microbial activites were usually found after applications of heat treated sludge but there was little difference noticed between activity with untreated and irradiated sludge. Depending on the type of soil, studies showed an increase in the effective field capacity after the application of sewage sludge with the best effects often occurring with irradiated sludge. EXPERIENCE WITH A PILOT PLANT FOR THE IRRADIATION OF SEWAGE SLUDGE, ANALYTICAL STUDIES ON SEWAGE SLUDGE AND PLANT MATERIAL,
Technische Universitaet, Munich (West Germany). Institut fuer Radiochemie. Bayerische Landesanstalt fuer Bodenkultur, Pflanzenschutz, Munich (West Germany).
A. Rosopule, I. Fiedler, H. Staerk, and A. Suess.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/610. p 535-551, 10 tab, 2 fig.

Descriptors: *Analytical techniques, *Sewage treatment, Sludge, Heat treatment, Radiation, Nutrient removal, Treatment facilities, *Pilot plants, Trace elements, Sewage sludge, *Irradiation, Waste treatment.

Analytical studies conducted over a year's time showed that there is little difference in mineral contents and trace elements occurring in the sludge. Heat treatment tended to increase the ammonium content up to 70% over untreated sludge. Radiation treatment showed no changes in the sludge up to a pH of 8 and above that pH losses of ammonium were observed. Dewatering decreased the content of alkali elements, potassium, sodium, and ammonium, in the sludge but no change was found in other materials. (See also W76-09512) (Chilton-ORNL)

RECENT ADVANCES IN THE TREATMENT OF SOLID WASTES,
Technion-Israel Inst. of Tech., Haifa.
G. Shelef, and M. Lapidot.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/702. p 555-577, 7 fig, 1 tab, 128 ref.

Descriptors: *Solid wastes, *Recycling, *Waste treatment, *Reviews, Economics, *Bibliographies, Waste disposal.

This review paper discusses sanitary and safe disposal of solid wastes from the view point of resource recovery of raw material and energy. Conventional disposal methods such as landfilling, incineration and composting are described as well as comminution and separation techniques. The separation techniques include gravity separation, aerodynamic separation and magnetic and electrostatic separation. It is emphasized that the inherent values of the various components of solid wastes, in the form of recoverable, recyclable, and re-usable materials and energy, can provide the basis of an economic and safe solution to the disposal. USE OF SEWAGE SLUDGE AS FODDER,
Batelle-Institut e.V., Frankfurt am Main, (West Germany).
W. Schonborn.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/701. p 579-588, 6 tab, 2 fig, 24 ref.

Descriptors: *Environmental sanitation, *Sewage sludge, Sewage treatment, *Foods, Nutrients, *Disinfection, Waste treatment.

One possible way of utilizing the protein and vitamin content of sewage sludges would be their use as fodder. It is recognized that a number of objections, (the presence of pathogenic bacteria, toxic substances (especially carcinogens), quantities of heavy metals, and some species of microorganisms,) exist to the use of sludge as fodder. The author feels that these objections can be overcome by disinfection of the sludge and cites instances of successful feeding experiments. (See also W76-09512) (Chilton-ORNL)

POTENTIAL OF RADIATION STERILIZATION IN SOLID WASTE TREATMENT, A STATUS REPORT,
Israel Atomic Energy Commission, Yavne. Soreq Nuclear Research Centre.
R. Padova, M. Lapidot, M. Molco, and I. Ross.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/703. p 589-599, 3 tab, 38 ref.

Descriptors: *Environmental sanitation, *Solid wastes, Radiation, Disinfection, Foods, Animals, Reviews, *Waste treatment, *Irradiation.

The particular character of household garbage and of agricultural wastes renders it unsuitable for solid waste resource recovery techniques at present in use but the high nutrient content of the putrescible matter contained in the garbage render it particularly suitable for direct conversion into animal feeds. Sterilization by steam autoclaving is unsatisfactory because of the unpredictable penetration of the steam and the frequent re-contamination during cooling. Gassing with methyl bromide is not safe because of the absorption of methyl bromide in some of the components of the product. The high potential of ionizing radiation in the processing of putrescible matter into animal food is, thus, clearly indicated although not yet permitted in many countries. A pilot plant which processes 200-300 tons/day demonstrates the economic and technological feasibility of the ionizing radiation process. (See also W76-09512) (Chilton-ORNL)

RADIATION RECYCLING PROCESS OF WASTE POLY(TETRAFLUORETHYLENE) SCRAP,
Kyoto Univ., (Japan). Faculty of Engineering.
V. T. Kagiya, and M. Hagiwara.
In: Radiation for a Clean Environment, Proceedings of a symposium held in Munich, March 17-21, 1975. IAEA-SM-194/704. p 601-612, 6 tab, 4 fig, 4 ref.

Descriptors: *Solid wastes, *Radiation, Gamma rays, *Recycling, *Plastics, *Waste treatment, Industrial wastes.
Identifiers: Poly(Tetrafluorethylene).

Conventional methods for recycling of poly(tetrafluorethylene) (PTFE) are unsatisfactory for chemical and physical reasons. The paper describes a radiation procedure which produces PTFE in the form of a fine powdery wax. The decontaminated PTFE is irradiated with gamma rays up to 5-20 Mrad at room temperature and is then heated at 250-300 degrees C for 5-10 hours. The product is easily pulverized to a fine powder. The radiation process reduces the evolution of toxic fluorine-containing compounds which result from thermal decomposition. Irradiated scrap is more easily pulverized than non-irradiated scrap. OPTIMAL ACTIVATED SLUDGE DESIGN UNDER UNCERTAINTY,
Auburn Univ., Alabama. Dept. of Chemical Engineering.
A. R. Tarrer, C. P. L. Grady, Jr., H. C. Lim, and L. B. Koppel.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. EE3, Proceedings paper No. 12207, p 657-673, June 1976. 5 tab, 2 fig, 28 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Design, *Optimization, *Economic analysis, *Computer programs, Capital costs, Operations research, Effects, Constraints, Mathematical models, Algorithms, Equations, *Risks.
Identifiers: Sensitivity analysis.

Designers of wastewater treatment processes must recognize and deal with the interactions among individual operations in the process stream if optimum designs are to be achieved. Care must be exercised in the use of sophisticated optimization techniques, however, if realistic as well as economic designs are to result. This article describes a mathematical model of the liquid process train (primary settler, aeration basin, final settler, chlorination) of the activated sludge process and its use to obtain the optimum design required to meet specified criteria for effluent soluble organics and suspended solids concentrations with a desired degree of confidence. Provisions were made for incorporating the uncertainty associated with experimentally determined parameters. The final settler model included both clarification and thickening functions and it was found that the clarification term exerted a strong

ffect upon the final design. Liquid-solid separaon parameters were found to be as important as iological kinetic parameters in determining the ptimum design. Treatment cost was found to be elatively insensitive to the mean cell residence me or the suspended solids removal efficiency, lthough those items exerted significant effects pon the sizes of the individual unit operations. dentifiers: *Cost minimization.

resented is a realistic, comprehensive approach or the cost optimization of an integrated activated ludge system consisting of a liquid treatment rocess train and a sludge disposal process train. he method is based on the most recent steadytate unit process models and leads to rational esigns. Biological solids retention time is used as he primary independent design variable. The opimization problem is formulated by combining the quations for the various unit process models with he cost equations into an objective function. The bjective function is then minimized within the aceptable design range of the independent variales. Optimal designs to several treatment situaions are presented and discussed. Specifically, he change in the optimal design with changes in nfluent waste strength, influent waste flow, ludge settling characteristics, and sludge dispoal rocess trains is given. Analysis of the optimal lesign emphasizes the allocation of costs to the arious unit processes. (Bell-Cornell)

dentifiers: Sodium.

eachate production is one of the effects of sanary landfill operations which must be controlled. or many landfill sites, collection, treatment, and isposal of the leachate which drains from the fill re used to insure groundwater protection. eachate may be treated and dispersed into the enironment in a harmless manner as other wastevaters are. Treatment could be achieved by a umber of different methods. Despite some inestigations, the design engineer is generally faced vith limited information and data on the treatabiliy of this strong, variable wastewater. This paper xamines anaerobic decomposition as a leachate reatment process. In addition to presenting data or operating criteria, this research also inestigates the effect of sodium, the cation present n highest concentration in leachate, on the effiiency of the anaerobic leachate treatment rocess. Information presented in this paper is also applicable to an understanding of anaerobic decomposition and the inhibition of methane fermentation in landfills. This information would be of value in cases where methane is collected from the fill on a commercial basis. (Bell-Cornell)

REVERSE OSMOSIS -- CAN IT REPLACE DISTILLATION,
C. F. Frith.
Chemical Processing, p 19, 21, January, 1976. 3 fig, 2 tab, 8 ref.

Descriptors: *Reverse osmosis, *Filtration, *Waste water treatment, Treatment facilities, Membrane processes, Desalination.

Consolidating engineering, production, and maintenance personnel in treatment plants has improved efficiencies, but quality is more variable. Central system maintenance affects every user, downtime stops all production, the method of sanitizing or chemical cleaning may adversely affect special end products, the main system's quality problems have tremendous implications for every process that requires water and, most importantly, those processes for which superior quality is justified are often compromised by emphasis on budget restrictions. For these reasons, compact, point-of-use reverse osmosis (RO) systems were developed. The Milli-RO 15, a 15 liter/hr system operating from municipal supply, can be quickly converted into a 4 liter/hr unit by replacing the reverse osmosis cartridge, or modified to increase production rates by adding a pump module. Milli-RO systems employ prefilter and reverse osmosis modules, with a pump module between the two in the Milli-RO 40. Reverse osmosis removes many contaminants. These units can be selected, installed, and operated at the point-of-use, allowing control by the user. Eighty liters/hr can be produced by increasing pressure. Replacing the cartridge in a very short time when the system had been fouled was an important advantage to one user whose feed water quaity was very poor. RO is satisfactory as an alternative to the traditional distillation method for purifying water. (Snyder-FIRL)

DEVELOPMENT OF A CONTINUOUS INCLINED SAND BED FILTER,
Simon-Hartley Ltd., Stoke-on-Trent, (England).
J. T. Allanson, and E. P. Austin.
Filtration and Separation, Vol. 13, No. 2, p 165-166, 168-169, March-April, 1976. 6 fig, 5 tab, 3 ref.

Descriptors: *Filtration, Laboratory tests, *Suspended solids, *Sewage treatment, Equipment, Costs, Biological treatment, *Waste water treatment, *Filters.
Identifiers: *Sand bed filters, Filler backwashing.

A low-cost continuous filter has been developed which employs a moving sand bed in which the flows of sand and water have been arranged to minimize the possibilities of blockage. Sand is withdrawn from the center of the bottom of a cylindrical container, creating an inclined surface with the largest particles at the lowest part in the center. Liquid enters at the center and leaves from the periphery, and the sand withdrawn is cleaned and added to the edge at the top of the container. A laboratory bench model, a pilot filter, and a prototype filter were tested. The results from all were satisfactory. The laboratory model removed equal or greater amounts of suspended solids when compared to a static sand bed. The pilot filter was tested on the overflow from the biological treatment plant humus tanks at a paper mill and the final effluent from a mechanical-aeration plant treating mainly domestic sewage. Techniques for backwashing the filter were developed in case a slug of solids should enter the filter. The prototype filter was similar to the pilot plant, but larger, and it operated similarly. A standard range of such filters has been designed, using the diameter of the filter as the basic dimension. This type of filter saves civil engineering costs as compared to rapid gravity and pressure filters, because it operates continuously and therefore does not need storage facilities for use while backwashing. In a specific example analyzed, the motor horsepower needed for the pump was less than for either of the other systems, and, unlike the other systems, no automatic control was required. (Snyder-FIRL)

THE OPERATION OF A SIMPLEX ACTIVATED SLUDGE PILOT PLANT IN AN ATMOSPHERE OF PURE OXYGEN,
Greater London Council (England).
L. B. Wood, R. P. King, M. K. Durkin, H. J. Finch, and D. Sheldon.
The Public Health Engineer, Vol. 4, No. 2, p 36-43, March, 1976. 2 fig, 4 tab, 10 ref.

Descriptors: *Sludge treatment, *Activated sludge, *Aeration, Oxygen, *Pilot plants, Nitrification, Biochemical oxygen demand, Treatment facilities, *Waste water treatment.
Identifiers: *Oxygen activated sludge.

Replacing air with oxygen in the activated sludge process has been studied. In the first stage of the work, two sludges were treated at retention times of 4 to 8 hr at a small modified diffused air pilot plant. The second stage, using an adapted single aerator plant, included the following phases: preliminary studies to gain experience with the pilot plant; chemical adjustment of the mixed liquor pH; acclimatization of nitrifying sludge from a diffused air plant; operation with a nitrifying sludge; studying the mixed liquor suspended solids (MLSS) build-up rate by operation without withdrawing sludge; comparing retention times of 6.9, 3.9, 2.4, 1.7, and 1.2 hr, including nitrification and ratio of volatile suspended solids (VSS) to total suspended solids (TSS) at different retention times; treatment of crude sewage; and addition of ferric iron. Replacing air with oxygen did not increase the growth rate of organisms responsible for carbonaceous and ammonia oxidation or their oxidation rate for a unit mass of organisms. The maximum growth rate of Nitrosomonas can be reduced in single stage systems by low pH in mixed liquor where the latter is enclosed with oxygen, and carbon dioxide allowed to build up in the gas space. However, the greater facility provided by oxygen use in allowing high MLSS concentrations to be maintained, offers the possibility of greater hydraulic loading and smaller volumetric capacity for plants aimed only at removal of biochemical oxygen demand (BOD) load. Sludge quantity was not reduced. The growth rate of organisms oxidizing carbonaceous substrate was similar to that with air-based sludge and produced a similar sludge yield. Generally sludge settlement, as measured by the standard procedure and used to calculate linear settlement rate, revealed no special advantage to oxygen use. (Snyder-FIRL)

WASTEWATER TREATMENT IN NEW ZEALAND,
Auckland Univ., (New Zealand). Dept. of Civil Engineering.
I. W. Gunn.
The Public Health Engineer, Vol. 4, No. 2, p 49-55, March, 1976. 1 fig, 7 tab.

Descriptors: *Waste water treatment, *Design, *Treatment facilities, Industrial wastes, Biological treatment, Water pollution control.
Identifiers: *New Zealand.

Considerable experience has been gained in the design and operation of treatment plants for a population of less than 5000 in New Zealand. Public sensitivity to effluent discharge is high, since most population centers are near major rivers or the coast, and estuaries and coastal waters are used for recreation and shellfishing. Farm wastes posing pollution problems include artificial fertilizers as well as animal wastes. Meatworks and dairy factories have been slower than municipalities to invest in pollution control equipment, although this type of industry produces a greater waste load. Individual household disposal systems designed according to the 1961 Codes of Practice have not been successful, and such individual systems are discouraged. The 'Imhoff' tank has been widely used for settling and sludge stabilization in small plants prior to biological treatment. Variations of the 'Pasveer Ditch' process have been used in some areas. Package plants are used in a few communities and for private treatment plants; extended aeration is the most common process. Lagoons are the most widely used method of treating community waste water. Fifteen communities use tertiary treatment after conventional biological treatment, predominantly bacterial reduction lagoons. Most treatment plants are designed empirically, with allowance for future growth. The Central Government runs programs to train operators. (Snyder-FIRL)

FLUIDIZED BED TO HANDLE COMBINED WASTE SLUDGES,
Public Works, Vol. 107, No. 5, p 108, May, 1976. 1 fig.

Descriptors: *Sludge treatment, *Waste treatment, *Industrial wastes, Pulp and paper industry, Municipal wastes, Treatment facilities, Dewatering, Centrifugation, Design criteria, Pulp wastes, Waste water treatment.
Identifiers: Fluidized bed reactor, Municipal-industrial wastes, Combined treatment.

The waste water treatment facility being built for the Tyrone Borough Sewer Authority in Blair County, Pennsylvania, has been designed to receive white-water sludge from a nearby paper mill. The plant is modular design, will include space-saving features to accomodate plug flow or complete mix operation, and is flexible enough for varying industrial and seasonal changes. Solids load is expected to be 7900 lb/day primary sludge and 3100 lb/day secondary sludge at full capacity. Sludge, both primary and secondary, will be dewatered in a fluidized bed process, by means of a solid bowl centrifuge with the aid of a cationic polymer. In the fluidized bed reaction, fluidizing and combustion air are preheated to 1000 F by extracting waste heat from the reactor gases. Excessive particulate emissions in the exhaust gases are prevented by a high-energy wetted wall venturi scrubber followed by a packed secondary scrubber-cooler. (Kramer-FIRL)
W76-09671

VALUE ENGINEERED SEWAGE PLANT MOVES FAST,
Engineering News-Record, Vol. 196, No. 17, p 22, April 22, 1976. 2 fig.

Descriptors: *Costs, Construction, *Sewage treatment, *Treatment facilities, *Tertiary treatment, *Construction materials, Engineering, Design criteria, Waste water treatment.
Identifiers: *Value engineering.

Time and cost savings were effected in the value engineered construction of a sewage treatment plant in Concord, California. The 30 mgd tertiary treatment plant will recycle effluent from an upgraded secondary treatment plant, producing industrial cooling and process water. Due to weather and other delays, the project began behind schedule. Engineers agreed to change the foundations specification for the structure set in clayey soil when a sand lens was located about six feet below the elevation of the valve structure floor slab. The sand lens was an acceptable bearing for the structure, and excavation of only 21 feet in depth needed to be made. With the raised elevation, open cutting could be performed on three sides for the excavation on a 1.5:1 slope to install the outfall line. By eliminating the building of a cofferdam for excavation, work was completed in one, rather than five weeks. Other innovative construction techniques included the shop fabricating of 18 to 72-inch steel piping, rather than field welding; the preassembly of intake and discharge manifolds up to 60 ft long and 30 ft high; and the use of modular steel panels to assembly forms for placing wall structures. (Kramer-FIRL)

ANAEROBIC TREATMENT OF DILUTE WASTE WATERS,
Technische Hogeschool, Delft (Netherlands). Lab. of Chemical Engineering.
R. R. Van Der Meer, J. Van Brakel, and P. M. Heertjes.
Delft Progress Report, Vol. 1, No. 5, p 143-149, 1976. 6 fig, 4 tab, 23 ref.

Descriptors: *Anaerobic digestion, *Waste water treatment, *Sludge treatment, *Recycling, Chemical oxygen demand, Equipment, Sludge digestion.
Identifiers: Stirred up-flow reactor(ISUR).

The application of anaerobic digestion to purification of dilute waste water was studied. Five reactors were used: a packed up-flow reactor (PUR) filled with high porosity polymer objects, a PUR filled with 2 to 3 cm gravel, an intermittently stirred up-flow reactor (ISUR), an ISUR with a device to break floating sludge, and an ISUR with sludge recycling. Simple substances such as acetate, glucose, and beet sugar were used to simulate waste water. An anaerobic up-flow reactor can reduce the chemical oxygen demand (COD) of these model waste waters to 10%. Two to 5 kg COD/cu m day is the maximum organic loading, corresponding to 7 to 18 hr retention times. Twenty to 50 days are required for a system to completely adapt to a particular feed. After adaptation, it adjusts easily to changing conditions and recovers rapidly from short disturbances such as a pH drop. There were no significant differences between the behavior of the packed bed and the ISURs. (Snyder-FIRL)

A STUDY OF ROTATING-DISC TREATMENT UNITS OPERATING AT DIFFERENT TEMPERATURES,
Loughborough Univ. of Technology (England). Dept. of Civil Engineering.
K. V. Ellis, and S. E. I. Banaga.
Water Pollution Control, Vol. 75, No. 1, p 73-91, 1976. 13 fig, 5 tab, 20 ref.

Descriptors: *Biological treatment, Hydraulics, Laboratory tests, *Biochemical oxygen demand, *Temperature, *Waste water treatment, Performance, Operations, Design, *Treatment facilities.
Identifiers: *Rotating discs treatment.

The optimum mode of operation of a rotating-disc unit (RDU) and the effects of three different temperatures on its efficiency were studied. For a 14 week preliminary period, the specially designed laboratory RDU's were operated to establish the general capabilities of the design, to gain reasonable experience in operating the unit, and to establish an optimum rotational speed for the discs. During the principal investigation, the three RDUs were operated at 11 C, 18 C, and 27 C. Various hydraulic retention periods and liquid levels were investigated. A disc rotation speed of about 4 rev/min produced the best results, and was used throughout the principal investigation. Laboratory scale RDUs were able to remove 97.5% of the biochemical oxygen demand (BOD) loading applied, and operated efficiently at over 20 g BOD/sq m d. BOD removal ability appreciably increases with temperature from 10 C to 20 C and less dramatically from 20 C to 30 C. The rotating discs should optimally be immersed 26% into the reaction vessel liquid. With the discs 26% immersed, 4 rev/min disc speed, and 97 min liquid retention, units operating at all three temperatures tested, produced effluents well within the Royal Commission standard. Effluent recirculation failed to appreciably improve the effluent. The concentration of mixed liquor suspended solids (MLSS) in the reaction vessel was about 23,000 mg/liter. This individual small unit may be between 3 and 7 times as efficient as the activated sludge process and 40 to 60 times as efficient as a conventional biological filter. (Snyder-FIRL)

PURIFICATION OF WASTE WATER BY POLYMER EXCHANGERS (JATEVESIEN PUHDISTAMINEN POLYMEERIVAIHTAJILLA),
E. Pulkkinen.
Kemia-Kemi, No. 1, p 6-11, January, 1976. 11 fig, 3 tab, 8 ref.

Descriptors: *Activated sludge, *Colloids, *Coagulation, *Polymers, *Polyelectrolytes, *Flocculation, *Waste water treatment, Sludge treatment, Cations, Anions, Municipal wastes, Costs, Chemical precipitation, Ion exchange, Europe.
Identifiers: *Finland.

Colloidal hydrophobic particles in water are negatively charged and it is this charge that keeps them dispersed. They can be stabilized by adding an electrolyte, which causes the ion cloud surrounding the particles to shrink; by adding an electrolyte that neutralizes the negative charge; by adding an anionic polyelectrolyte that causes the particles to bunch together; or by destabilizing the pH of the particles so that they lose their charge and coagulate. In treating domestic waste water by the activated sludge process, sludge settlement takes place more rapidly with the addition of cationic polyelectrolytes. Anionic polyelectrolytes are suitable for thickening primary waste water, whereas secondary sludge or the activated sludge is best thickened through the action of cationic polyelectrolytes. The concentration of primary sludge with anionic polyelectrolyte in the vacuum filter process works well; however, the addition of a small amount of anionic polymer (HPAM) followed by cationic polyamines works better for activated sludge. Cationic polymers have proven indispensable in concentrating municipal waste water by the centrifugal process. The cost of electrolytes has remained relatively high in Finland, which is one reason that they are not widely used in that country. Recently, the Oulu University Chemistry Department has been studying water soluble polymers, with the objective of explaining the effects of cationic polymer structures on the precipitation ability of colloids. ASSESSMENT OF VIRUS REMOVAL BY A MULTI-STAGE ACTIVATED SLUDGE PROCESS,
Industrial Environmental Research Lab., Cincinnati, Ohio.
R. S. Safferman, and M-E. Morris.
Water Research, Vol. 10, No. 5, p 413-420, 1976. 3 fig, 6 tab, 22 ref.

Descriptors: *Viruses, *Activated sludge, *Biological treatment, Chemical precipitation, *Waste water treatment, Effluents.
Identifiers: *Virus removal.

The virus removal capacity of a complex multistage biological system combined with ap-

propriate chemical additives and final filtration was studied. The indigenous viral population in the primary effluent and after each stage of treatment were determined. The system was then seeded with phage f2 and sampled again at the same locations. The treatment process effectively reduced the seeded viruses. The highest reduction was in the high-rate activated sludge and denitrification modules, both averaging over 95% virus removal. Virus reduction for the treatment system as a whole was calculated at 99.97%. The indigenous viruses present after primary settling illustrated the wide diversions that can occur in waste waters during a 24 hr period and the necessity of collecting temporally related samples within the treatment system. There was apparently no direct relationship between the quantities of enteroviruses and coliphages present in primary effluent. (Snyder-FIRL)

INDUCTIVE CAVITATOR KEEPS FILTER GRATINGS CLEAR OF DEBRIS,
R. F. Stengel.
Design News, Vol. 31, No. 9, p 19, May 10, 1976. 2 fig.

Descriptors: *Filtration, *Filters, *Waste water treatment, Effluents, Equipment, Flow, Energy.
Identifiers: *Filter gratings, *Inductive cavitators.

Effluent in process plants sometimes contains solid debris that should not enter sewage lines. Installing a filter grating with suitable mesh width traps the debris, clogging the filter. Periodical shutdowns are usually used to clean the grating. Periodical or continuous mechanical means work poorly with some grating types. A solution involves a main outflow line below the grating carrying clean effluent and a secondary stream directly above the grating flushing off the debris. A mechanical oscillator at the lowest part of the tank acts through the liquid, shaking debris from the grating. The inductive cavitator is purposely run not at resonance, unlike many previous sonic systems. The off-resonance driving frequency permits precisely controlling vibratory energy delivered to the liquid. The direction of the externally polarized motion is adjustable, if needed, to distribute energy more uniformly through the liquid volume. (Snyder-FIRL)

EFFLUENT DETENTION PONDS DECHLORINATE WASTEWATER,
Stone (Ralph) and Co., Inc., Los Angeles, Calif.
R. Stone, H. Smallwood, and L. Bennett.
Public Works, Vol. 107, No. 5, p 90-91, May, 1976. 1 fig.

Descriptors: *Waste water treatment, *Chlorine, *Biochemical oxygen demand, Suspended solids, Analytical techniques, Treatment facilities, California, Pollutant identification.
Identifiers: *Chlorine analyzer, *Dechlorination, *Detention ponds(Wastes), Ventura River(Calif).

The Oak View Sanitary District installed a unique facility for waste water dechlorination at a minimum cost to meet the California and United States requirements for no free chlorine discharge into the Ventura River. In 1975, the optimum dosage of chlorine to the effluent was about 165 lbs per day, producing a residual 2.5 to 3.0 mg/liter at the outlet of the chlorine contact chamber. Two dechlorination ponds with a capacity of about one million gallons each provided an average retention time of over one day at the 1975 flow rate. These ponds have concrete-lined slopes and unlined floors and an average operating depth of 5.5 ft. Longitudinal baffles to improve velocity distribution restrict the flow channel width to 25 ft. The dechlorination ponds reduce 5 day biochemical oxygen demand (BOD) and suspended solids as well as reducing chlorine residuals to less than 0.1 mg/liter. Since the probe of a chlorine analyzer becomes insensitive to chlorine if it is not periodically exposed to a chlorine solution, the required residual monitor samples the chlorine contact chamber effluent and the final effluent alternately. DEWATERING OF SEWAGE SLUDGE VIEWED AS PART OF THE PURIFICATION PROCESS -- PLANNING CRITERIA (KLAERSCHLAMMENTWAESSERUNG ALS TEIL DER GESAMTEN KLAERAUFGABE BETRACHTET -- PLANUNGSKRITERIEN),
G. Henseler.
Wasser, Energie, Luft, Vol. 68, No. 1, p 17-23, 1976. 7 fig, 4 tab, 13 ref.

Descriptors: *Dewatering, *Sewage sludge, *Fertilizers, *Land use, Odor, Flocculation, Oxidation, Filtration, Filters, Centrifugation, Sludge disposal, Landfills, *Waste water treatment, Sewage disposal.

Different methods for sewage sludge dewatering for subsequent distribution on farmlands or disposal on sanitary landfills are reviewed. To avoid malodorous emissions, only thoroughly digested sludge with a minimal dry matter content of 50% should be distributed on farmlands. Dewatering requires cold chemical conditioning by flocculation and oxidation, or hot conditioning at 200 C under increased pressure, which is also suitable for sludge sterilization. Low-pressure band and drum filters, vacuum filtration, high-pressure filtration and centrifugation are described. Worm centrifuges with solid jackets, operating at accelerations as low as 400 g, are able to separate over 95% of water from the sewage sludge. (Takacs-FIRL)

THE EFFLUENT LAGOONS GREIFSWALD-LADEBOW (DAS ABWASSERTEICHSYSTEM GREIFSWALD-LADEBOW),
S. Schwarz.
Wasserwirtschaft-Wassertechnik, Vol. 26, No. 3, p 94-96, 1976. 6 fig, 4 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Biochemical oxygen demand, *Treatment facilities, *Lagoons, Effluents, *Ventilation, Temperature.
Identifiers: *Turboventilators.

The effect of two turboventilators installed in the first member of a lagoon series with a capacity of 8,000 cu m/day and a flowthrough time of 9.3 days was studied by investigation of chemical, biochemical and biomass parameters. The observed rapid equalization of the temperatures of freshly admitted waste water and of lagoon water implies reduced heat losses to the air, and consequently high bacterial activity even during the winter period. Ventilation resulted at best in a negligible rate of activated sludge formation. The increase in the BOD5 level was due only partly to the overloaded ventilated system. Ventilation at the same time intensified the enzymatic degradation of organic substances in contact with sludge-covered surfaces. (Takacs-FIRL)

POSSIBILITIES AND LIMITS OF EXTENDED WASTE WATER PURIFICATION (MOEGLICHKEITEN UND GRENZEN DER WEITERGEHANDED ABWASSER-REINIGUNG),
Stuttgart Univ. (West Germany). Institut fuer Siedlungswasserbau und Wasserguetewirtschaft.
F. Poepel, and I. Sekoulov.
Umweltschutz-Staedtereinigung, No. 4, p 76-80, 1976. 1 tab, 9 ref.

Descriptors: *Waste water treatment, *Biological treatment, *Biochemical oxygen demand, *Nitrification, *Denitrification, Oxidation, Chemical precipitation, Phosphorus, Suspension, Filters, Sands, Percolation, Organic matter, Hydrogen ion concentration.
Identifiers: Nitrification/denitrification.

Possibilities and limitations of the final purification of waste water in biological treatment plant for the protection of recipients and to guarantee an adequate water quality for drinking-water preparation are described. The BOD5 level of the purified waste water can be substantially reduced by the removal of suspended matter, for which process sand filters flushed with hydrogen peroxide-treated water, and microstrainers with 20-25 micron-mesh are available. Nitrification can be intensified by the use of porous percolation bodies and sand filtration, using oxygenated water. The subsequent biological denitrification in sand filters is performed without oxygen, and the oxygen liberated from the nitrates is used for the oxidation of other organic substances. Phosphorus can be eliminated from waste waters by chemical precipitation with trivalent metal salts or lime, or by increasing the pH value by means of flue gases, sodium hydroxide, or a biological process using algae which liberate oxygen from carbon dioxide. It is possible to reduce the phosphorus level to below one mg/liter. (Takacs-FIRL)

THE RELATIONSHIP BETWEEN DISSIMILATORY NITRATE REDUCTION AND OXYGEN UPTAKE BY CELLS OF AN ALCALIGENES STRAIN IN FLOCS AND IN SUSPENSION AND BY ACTIVATED SLUDGE FLOCS,
Agricultural Univ., Wageningen (Netherlands). Dept. of Microbiology.
J. M. Krul.
Water Research, Vol. 10, No. 4, p 337-341, 1976. 7 fig, 1 tab, 17 ref.

Descriptors: *Oxygen, Nitrates, *Flocculation, *Bacteria, Anaerobic conditions, Nitrogen, Analytical techniques, Sludge treatment, Activated sludge, *Waste water treatment, *Denitrification, Absorption, Biological treatment.
Identifiers: Oxygen uptake.

The effect of oxygen concentrations on the oxygen uptake and the dissimilatory nitrate reduction by anaerobically grown cells in flocs and in suspension was studied. A number of isolated bacteria of a denitrifying Alcaligenes strain were tested for ability to form flocs, the floc's sensitivity toward dispersion by cellulase, and denitrifying ability. Nitrate reduction by cells in flocs increased considerably at oxygen concentrations below 1.5 mg/liter. For cells in suspension, nitrate reduction increased at oxygen concentrations below 0.1 mg/liter. Cells grown anaerobically became sensitive to inhibition of respiration by nitric oxide from nitrate reduction after 24 hr of aeration in a medium free of nitrogen. As a result, nitrate reduction increased below 2.5 mg oxygen/liter for cells in flocs and below 0.1 mg oxygen/liter for cells in suspension. (Snyder-FIRL)

PROBLEMS CONCERNING THE CHARACTER OF OXIDIZABILITY OF CERTAIN ORGANIC SUBSTANCES IN WATER TREATED WITH

OZONE (PROBLEMES LIES A L'EVOLUTION DU CARACTERE D'OXYDABILITE DE CERTAIN CORPS ORGANIQUES PRESENTS DANS L'EAU TRATEE PAR L'OZONE),
J. C. Block, M. Morlot, and J. M. Foliguet.
Techniques et Seiences Municipales--L'Eau, Vol. 71, No. 1, p 29-34, January, 1976. 8 fig, 1 tab, 14 ref.

Descriptors: *Organic compounds, *Waste water treatment, *Ozone, Water treatment, *Oxidation, *Pollutant identification, Color, Turbidity, Biological treatment, E coli, Soils, Detergents.
Identifiers: Organic carbon, Malathion.

While the action of ozone on organic products in water produces impressive changes in such parameters as color and turbidity, it is not necessarily indicative of in depth or complete structural modifications. The evolution of biodegradability and oxygen demand, both of which vary considerably depending on the substances being treated, can impose certain constraints upon treatment such as the possible proliferation of microorganisms in the distribution network or a significant chlorine demand following ozonation. It is difficult to evaluate the efficacy of treatment or the quality of a sample due to the disparity of measures. Thus, in the case of 4 samples tested -- an E. coli suspension, a 300 ppm anionic detergent solution, a 123 ppm malathion solution, and a soil extract solution of a yellow-brown color--an identical 20% elimination of organic carbon was expressed by a disappearance of 50% color from the soil extract, of 95% turbidity of the bacterial suspension, of 96% of malathion molecules, and only of 10% of detergent. BIODEGRADABILITY AND PROCESS FOR BIOLOGICAL PURIFICATION OF WASTE WATER (LA BIODEGRADABILITE ET LES PROCEDES D'EPURATION BIOLOGIQUE DES EFFLUENTS),
P. Laboureur.
Techniques et Sciences Municipales L'Eau, No. 2, p 45-51, 1976. 1 fig.

Descriptors: *Biological treatment, *Biodegradation, *Waste water treatment, *Measurement, Oxygen, Organic compounds, Microorganisms, Analytical techniques, Organic matter.
Identifiers: Organic carbon.

The assessment of biodegradation is discussed. Biological degradation is a process which occurs naturally to prevent accumulation of organic matter; its agents are aerobic microorganisms. General methods of assessment are based on measurement of oxygen (respirometric method) or organic carbon. In any waste water treatment method, it is important to know the biodegradation rate. Because no known organisms are able to thrive on synthetic organics, alternative treatment methods to biological treatment must be employed. (Kramer-FIRL)

HOW TO BUILD A BETTER BENCH SHEET,
Las Cruces Water Quality Lab., N. Mex.
D. W. Clark.
Water and Sewage Works, Vol. 123, No. 4, p 69-71, April, 1976. 2 fig.

Descriptors: *Laboratory tests, *Data processing, *Waste water treatment, Analytical techniques, *Pollutant identification, Water analysis.
Identifiers: *Bench sheet records.

Laboratory data is valuable in waste water treatment, and a bench sheet has been developed that provides maximum assurance that each test has been properly performed while containing sufficient information that results can be rechecked. Although the bench sheet is the most important repository of laboratory information, the value of a good bench sheet is often overlooked. Bench sheets should be kept separate from interpretations of results and should be of an appropriate size for handling and filing. A bench sheet should provide spaces for complete sample identification and logical development of test data. It should also include auxiliary information and formulas and space for calculations. There should be space for comments and, where more than one person works in the laboratory, a method of accountability. Bench sheets can be designed to show either one determination for all samples or all tests performed on a single sample. A sample bench sheet provides for recording date and time, location, nature of the sample, the person collecting it, dissolved oxygen, temperature, pH, and solids determinations. Most of the data is entered in the order in which it is accumulated. Space for data on percent volatile material is included with the solids data, and for biochemical oxygen demand (BOD) on the reverse side of the bench sheet. The sample volumes most often needed to determine compliance with standards are printed on the sheet, and places are provided to indicate the individuals performing the tests. When completed, the bench sheet records the condition of the effluent on a given day. (Snyder-FIRL)

HOW TO DESIGN AERATED LAGOON SYSTEMS TO MEET 1977 EFFLUENT STANDARDS,
South Carolina Dept. of Health and Environmental Control, Columbia.
S. C. White, and L. G. Rich.
Water and Sewage Works, Vol. 123, No. 4, p 82-83, April, 1976. 1 fig, 1 tab.

Descriptors: *Suspended solids, *Lagoons, *Aeration, Biochemical oxygen demand, *Waste water treatment, Effluents, *Design criteria, *Aerated lagoons, *Water quality standards, *South Carolina, Treatment facilities.

As part of a four-part series on experimental studies conducted in South Carolina on the control of suspended solids in aerated lagoon effluents, this paper shows how the results of the studies are used in the design of aerated lagoon systems with effluent standards. Two classes of aerated lagoons currently in use are the completely-mixed (or completely-suspended) and the facultative (or partially-suspended) types. The completely mixed type is discussed in detail. An equation is provided to demonstrate how the residual substrate found in the effluent from a completely mixed system is based on a steady-state mass balance of an organic substrate. Temperatures of aerated lagoons can be estimated with a relationship derived from a thermal energy balance across a completely-mixed system; the appropriate equation is provided. A graph compares power-level requirements for oxygen and solids suspension in a completely-suspended aerated lagoon fitted with surface aerators to treat a typical domestic waste water. In a partially-suspended (facultative) aerated lagoon, oxygen requirements increase, due to BOD feedback from the deposited solids. Oxygen requirements may be estimated for such lagoons, with the value of the BOD removed varying from winter to summer conditions. (Kramer-FIRL)

LABORATORY CENTRIFUGE SAVES TIME AND MONEY,
California State Water Resources Control Board, Sacramento.
S. Martinson, and D. G. Deaner.
Water and Sewage Works, Vol. 123, No. 1, p 61-63, January, 1976. 3 fig, 1 tab, 6 ref.

Descriptors: *Analytical techniques, *Centrifugation, *Activated sludge, Suspended solids, Control, *Waste water treatment, *Gravimetric analysis.
Identifiers: Gravimetric analysis, Mixed liquor suspended solids.

Centrifugal and gravimetric analyses of activated sludge and mixed liquor suspended solids were compared for controlling the activated sludge process. Grab samples from the Sacramento County's Central Treatment plant were analyzed by both methods. The fundamental problem with using the centrifuge is that the percent centrifuge concentration is constant only for a given sludge. However, except for modes of operation such as contact stabilization and activated sludge with reaeration, the mixed liquor suspended solids and the return sludge concentration are the same sludge, and the return rate can be calculated. For an example with actual data, return rates of 27% and 26% were calculated by centrifugal and gravimetric means, respectively. However, the gravimetric results took several hours to obtain, while the centrifugal results were available in 15 min. The shorter time required for analysis enables the operator to respond more quickly to changes in the process. (Snyder-FIRL)

TECHNIQUE ALTERNATIVES FOR A PACKAGE STABILIZATION PLANT,
E. C. C. Li.
Water and Sewage Works, Vol. 123, No. 5, p 60-61, May, 1976. 3 fig, 2 tab, 2 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Biological treatment, *Activated sludge, *Biochemical oxygen demand, *Treatment facilities, Stabilization, Aeration, Suspended solids.
Identifiers: *Contact stabilization, *Package plants.

efficiency of activated sludge in package contact abilization was studied. In this process, activated udge adsorbs small solid particles and absorbs issolved matter in the presence of oxygen in the ontact zone, is separated from the treated sewage a clarifier, is pumped to the reaeration zone here the bacteria grow and reproduce, and eturns to the contact zone. Package plants en-ountered process problems, mostly concerned ith the activated sludge, caused by such factors a hydraulic overload, a frequent waste shake, sufficient waste nutrients, and unbalanced tur-ulence. An attempt was made to correct these roblems by increasing the activated sludge con-nt and operating as an extended aeration rocess, but the biochemical oxygen demand BOD) and total suspended solids (TSS) in the ef-uent increased significantly. The use of aeration ontrol to build up the activated sludge was also ttempted. A third alternative involves acclimating e activated sludge before adding it to the reaera-on zone and adding a filter to prevent carry-over f finely divided solids into the effluent. (Snyder-IRL)

NCREASING THE CAPACITY OF SEDIMEN-ATION TANKS BY MEANS OF SLOPING LATES,
Vater Pollution Research Lab., Stevenage England).
1. J. D. White, R. C. Baskerville, and M. C. Day.
Vater Pollution Control, Vol. 75, No. 1, p 21-30, 976. 6 fig, 16 ref.

Descriptors: *Flocculation, *Sewage treatment, edimentation, Equipment, Efficiency, Installa-ion, *Settling basins, *Waste water treatment.
dentifiers: Sloping plates.

A module of inclined tubes was installed in one of wo identical humus tanks at a sewage treatment vorks serving a population of about 1800. Sewage vas pumped intermittently, producing a cyclic low variation in the tanks. Sloping tubes can in-rease the capacity of a conventional horizontal low sedimentation tank by an amount directly roportional to their projected surface area. The emperature of the influent should not be more han 0.2C higher than that of the bulk liquid, and he module should be washed down once every ne or 2 weeks. Sloping tubes appear suitable for prating humus tanks, but less suitable for primary anks and probably not suitable for tertiary treat-ent tanks without use of a flocculant. Installing loping tubes in an existing tank is expected to be ess expensive than building a new tank of the ame surface area, but the plastic tubes will robably not last as long as a new tank. (Snyder-FIRL)

DEVELOPMENT OF EDINBURGH'S SEWAGE DISPOSAL SCHEME,
Lothian Regional Council (Scotland).
A. S. Crockett, and J. Dugdale.
Proceedings of the Institution of Civil Engineers, Vol. 60, Part 1, p 53-78, February, 1976. 20 fig, 2 ab.

Descriptors: *Waste disposal, *Outfalls, *Sewage isposal, Storm water, Sedimentation, Effluent, nterceptor sewers, Sludge disposal, Construc-ion, Europe, Sewers, Waste water treatment, Estuaries.
dentifiers: Scotland(Edinburgh).

A conditional consent given by the Lothians River Purification Board to continue existing discharges rom Edinburgh required an improvement to be ompleted by May 1976. The existing system in-olves discharge of crude sewage into the Forth stuary through a number of short outfalls. The ew system devised includes interceptor sewers, rimary treatment on a site reclaimed from the stuary, and disposal of the effluent through an outfall and of the sludge at sea. Geological conditions in the area are quite varied. Interception will be through storm sewage overflows with storm sewage allowed to continue down the existing sewers. Because many of the routes lie through built-up areas, much of the construction must be done in tunnels. The site for reclamation is ideal; it is well situated with respect to the outfalls, near an industrial area, under shallow water, and angularly shaped to allow for a shorter sea wall. Four large sedimentation tanks will be used for treatment. Four very large storm tanks are also provided, in which material can be held for return to sedimentation. Effluent will be discharged through 20 vertical diffuser feed pipes rising from the latter part of the outfall tunnel. It is predicted that the E. coli concentration at emenity beaches under worst conditions will be no greater than 1000/100 ml. Sludge will be discharged at sea by gravity from a moving vessel. The cost of the full scheme is estimated at 26.04 million pounds. Construction of the system is progressing, and a reduced scheme is expected to operate by autumn 1976. (Snyder-FIRL)
W76-09707

SLUDGE HEAT TREATMENT: OPERATION AND MANAGEMENT,
Peterborough Sewage Div. (England).
C. R. Whitehead, and E. J. Smith.
Water Pollution Control, Vol. 75, No. 1, p 31-39, 1976. 1 fig, 7 tab, 4 ref.

Descriptors: *Heat treatment, *Sludge treatment, *Waste water treatment, *Methane, Biological treatment, Treatment facilities, Operations, Management.

The former Urban District of Havant and Waterlooville, Great Britain, treats sludge by heated digestion followed by heat treatment, with any surplus digested sludge being treated on drying beds. Sludge was treated on drying beds and in lagoons until 1961, when experimental work and cost investigation indicated that heat treatment would be the most economical process. Methane is collected and used as the main boiler fuel for heat treatment. Several modifications have been made to the system since it was commissioned. The plant was designed for treating 145.5 cu m/d of digested sludge at 5% dissolved solids (DS) or less. The filter presses will produce a cake of at least 50% DS in a pressing period of 2 hr or less. Variations in sludge consistency and significant changes in the rate of heat absorption led to the need to chemically clean the heat exchanger. Since March 1971 the plant has been run continuously until conditions indicate that a heat exchanger wash is required. Such conditions include increased boiler pressure, increased differentials across heat transfer surfaces, fall in the acceptable level of dry solids, increased press times, fall-off in press standards, and increase in odor from the plant. Recurrent problems have involved discharge valves, mono pumps, and farm flow units. The liquor treatment facilities at the plant consist of conventionally arranged biological filters. A spray deodorizer system around the plant's perimeter and a fiberglass lid and an ozonator for the thickening holding tank are used to control odor. (Snyder-FIRL)

INDUSTRIAL EXPERIENCE OF SEWAGE SLUDGE PROCESSING WITH ZIMPRO INSTALLATIONS IN THE NETHERLANDS,
Witteveen and Bos., Deventer (Netherlands).
E. L. C. Koster, J. H. J. M. van der Graff, and J. G. ten Wolde.
Berichte der Abwassertechnischen Vereinigung e.V., No. 28, p 429-445, 1976. 12 fig, 6 tab, 1 ref.

Descriptors: *Sewage treatment, *Sludge treatment, *Filtration, *Dewatering, Oxidation, Industrial wastes, Nitrogen, Biochemical oxygen demand, Europe, Waste water treatment.
Identifiers: *Zimmerman process, *Netherlands.

Industrial experience in processing fresh sewage sludge by the Zimmerman process has been obtained at installations at Apeldoorn and Breda in the Netherlands. The Zimmerman process's general characteristics--insensitivity to toxic components and changes in sludge composition, completely sterilizing fresh sludge by thermal oxidation without chemical conditioning, and excellent sludge dewatering properties--were important in the final choice of the processing system. The sludge at Apeldoorn has a large contribution from paper mills and 45% organic content. The sludge at Breda has a large contribution from the canned food industry and a 73% organic solids content. The systems for dewatering and discharging the filter cake differ; Apeldoorn uses a vacuum filter and a discharge system of conveyor belts and containers, and Breda uses filter presses, chain conveyors, and silos. The high organic solids content in Breda had an unfavorable effect on the thickening results. Due to rotting, buffering of fresh sludge in thickeners adversely affects the thickening results and must be kept to a minimum. Scaling in the heat exchangers may affect the energy balance, but the scaling can be removed by acid washes. The biochemical oxygen demand (BOD), chemical oxygen demand (COD), and Kjeldahl nitrogen at Breda increased after the Zimmerman process plant came into operation. The filter cake from Breda is suitable for use as a soil conditioner, but not a fertilizer, due to the lack of nitrogen. (Snyder-FIRL)

NEW YORK TAKES ANOTHER GIANT STEP,
Gannett, Fleming, Corddry and Carpenter, Inc., Harrisburg, Pa. Pollution Control Div.
H. B. Gerber, and G. G. Brinckerhoff.
Water and Wastes Engineering, Vol. 13, No. 3, p 24-26, 28, 48, March, 1976. 7 fig.

Descriptors: *Treatment facilities, *Sewage treatment, *Waste water treatment, *Aeration, Tanks, Equipment, Sludge treatment, Construction, New York.
Identifiers: *New York City Jamaica treatment plant.

Construction of an upgrading project at New York City's Jamaica Water Pollution Control Plant is nearing completion. The project includes a new sewage pumping station and screenings building; conversion of the primary settling tanks to remove both grit and sludge; converting the grit building to a grit and storage building; a new system to remove grease and scum; two new aeration blowers, and a new aeration system in the aeration tanks; conversion of the gas compressor building to an effluent pumping station; a new system to distribute waste sludge to the sludge thickening tanks; a new sludge thickening tank and extensive modification to two others; a new hypochlorite building; extensive modifications to the sludge digestion tank equipment and the gas collection and storage system; a sludge force main to another water pollution control plant; all new measuring and recording instruments; modifications to the plant drainage system; and major changes to the heating, ventilating, air conditioning, plumbing, and electrical systems. The existing sewage pumping station could not be demolished until the new one was ready to operate, so the new pumping station had to be built between the existing one and the main building, only 8 ft from the latter. (Snyder-FIRL)

THE DESERT WAR ON POLLUTION,
N. Gardner.
Water Services, Vol. 80, No. 960, p 87-88, February, 1976.

Descriptors: *Waste water treatment, *Recycling, *Water reuse, Water treatment, Sewage treatment, Waste disposal, Aeration, Asia, *Desalination.
Identifiers: *Middle East.

Rapid industrial and social development is taking place in Middle Eastern countries which had simple agricultural economies only 10 years ago. The greater prosperity and new industries have created a demand for better water treatment facilities. Desalination of water from desert bore-holes and sea water is often done in thermal type plants, due to the abundance of energy. Due to the scarcity of water, recycling of waste water is emphasized. Processes for recycling industrial waste water usually leave a concentrated waste, which will be disposed of at sea or on land following chemical and physical or thermal treatment. Aeration, which requires a minimum of maintenance, is frequently used for sewage. The deep shaft treatment process, in which effluent is circulated between two compartments in a shaft several hundred ft deep, has significant advantages for the Middle East. Attention is also being focused on the disposal of municipal solids. They can either be incinerated, with the ash used for landfill, or can be applied directly to land as compost. Due to the shortage of local water and sewage treatment consultants in the Middle East, there is competition between European, United States, and Japanese consultants. The Middle East has accounted for large increases in exports of British water treatment contracts. However, British export regulations sometimes make it impossible for British companies to bid competitively on the larger contracts. (Snyder-FIRL)

MICROBIAL ASPECTS OF CARBONISATION EFFLUENT TREATMENT,
University Coll., Cardiff (Wales). Dept. of Microbiology.
D. A. Stafford.
Effluent and Water Treatment Journal, Vol. 16, No. 3, p 136-137, 139, March, 1976. 20 ref.

Descriptors: *Waste water treatment, *Microorganisms, *Bacteria, *Activated sludge, Organic compounds, Industrial wastes, Oxidation, Pseudomonas, Carbon, Biodegradation.
Identifiers: *Carbonization effluents, Thiobacilli.

Microorganisms can readily utilize compounds from carbonization liquors as energy and carbon sources. Carbonization liquors also provide elemental sources for biosynthesis. Due to their biochemical potential, microorganisms are ideally suited for the chemical transformations necessary to mineralize the organic and inorganic compounds of carbonization liquors. The predominant bacteria in the activated sludge treatment of carbonization liquors include Pseudomonads and Thiobacilli; Pseudomonads are involved in the breakdown of organics, and reduced sulfur compounds are attacked mainly by Thiobacilli. The heterotrophic organisms obtaining carbon and energy from the aromatic and heterocyclic compounds of waste liquors are closely associated with those deriving energy from other processes. Some of the constituents in the effluents can affect the metabolism of some of these microorganisms. The products of reactions carried out by the microorganisms include substances necessary for their growth. Bacteria may act on some compounds preferentially; metabolic intermediates are often used preferentially to the original compounds. Adding certain organic compounds to the liquor feed increased the biochemical oxidation rate by as much as three times. The compounds also often improve effluent quality. Studies indicate that bacteria probably do not play a role in removing liquor components in waste-tip lagoon systems. (Snyder-FIRL)

OZONE PROVIDES ALTERNATIVE FOR SECONDARY EFFLUENT DISINFECTION PART 2,
Welsbach Ozone Systems Corp., Philadelphia, Pa.
C. Nebel, R. D. Gottschling, P. C. Unangst, H. J. O'Neill, and G. V. Zintel.
Water and Sewage Works, Vol. 123, No. 5, p 82-85, May, 1976. 8 fig, 3 tab, 41 ref.

Descriptors: *Sewage effluents, *Waste water treatment, *Disinfection, *Ozone, Phenols, Suspended solids, Chemical oxygen demand, Biochemical oxygen demand, Nitrogen, Color, Odor, Oxidation, *Sewage treatment.
Identifiers: *Secondary effluents.

As the second part of a continuing article, this paper describes new, economically feasible methods using ozone for the disinfection of secondary effluents. Contaminant removal may be achieved by a two-step process utilizing flotation. Suspended solids not captured by the plant secondary clarifier may be removed from the ozone contact chamber in this process. Additionally, ozone in small dosages removes substantial amounts of colored material. Reduction of COD in secondary effluent with ozone oxidation and physical removal by frothing was seen to vary, depending upon the initial COD level of the effluent. While refractory materials are biodegradable by ozonization, BOD values are mildly increased during ozonation of industrial municipal effluents. Studies on the oxidation of nitrogenous materials by ozone have been inconclusive, and ozonolysis cannot be considered a nitrification process. Phenol reduction has been demonstrated to take place rapidly at relatively low dosages of ozone. Additionally, pH is generally shifted following ozonation of secondary effluent. The formation of weak carboxylic acids from hydrocarbons tends to reduce pH, while C02 produced in the activated sludge process being removed by sweeping large volumes of air or oxygen through the ozone contact chamber tends to increase pH. (Kramer-FIRL)

Identifiers: *Solids removal.

Several schemes for separating solid pollutants from water flowing in a closed conduit were examined. Separation based on the momentum differential between the solids and liquids and the centrifugal movement of a conveying liquid were both examined under turbulent flow conditions. The study indicated these processes to have limited applications, primarily due to the difficulties in withdrawing a significant fraction of separated flow and the deleterious effects of turbulent mixing. However, utilization of the differential momentum of solid particles and water when flowing laminarly through a pipe was found to be a a viable separation scheme. Significant experimental separations (greater than 50 percent for pulverized coal and fly ash) were achieved. The experimental situation was modeled theoretically using particles approaching a sink located in a uniform stream. The theory closely predicted observed results for low velocity flows, with increasing flow velocity being the most significant contribution to deviations between experimental results and theory. The ratio of separated flow to flow passing the outlet was also found to affect the separation, but to a lesser degree than flow velocity. An application using small separator pipes in conjunction with a tank was shown to have potential advantages over using a settling tank alone. (Huffsey-Kentucky)

In: National Symposium on Urban Rainfall and Runoff and Sediment Control; Proceedings of symposium held July 29-31, 1974, Lexington, Kentucky. Report UKY BU106, p 109-113, October 1974. 9 fig, 1 ref. EPA 800744.

Descriptors: *Model studies, *Urban runoff, *Combined sewers, Mathematical models, Water quality, Discharge(Water), Sewers, Equipment, Cities, Storms, Storm runoff, Water pollution, Water pollution control, Runoff, Rainfall, Precipitation(Atmospheric), Urban drainage, *Wisconsin.
Identifiers: *Racine(Wis).

The Environmental Protection Agency Storm Water Management Model (SWMM) uses a high-speed digital computer to predict the quantity and quality of storm water runoff for a given rainfall event. This paper discusses the application of the SWMM to a combined sewer area of 832 acres which has its wet weather discharges treated by two satellite screening/dissolved air flotation units totalling 93 cfs in capacity. It was concluded that SWMM is an accurate tool for predicting the quantity and quality of urban runoff. Naturally, the results of the SWMM are only as accurate as the input data. All but the more recently built cities were originally provided with combined sewer systems. The concept of having two separate sewer systems gained ground some 50 years ago. The basic rationale for such a belief was that the storm runoff consisted of clean water that could be innocuously discharged without any treatment into the nearest receiving water body. Whatever technical and economic justifications there may have been for such a rule, these have been weakened by recent developments. First, as urban growth has resulted in ever greater agglomerations of population and industry, and as street traffic has intensified, it has been found that the runoff from the streets contains many contaminants in concentrations com-

rable to those in sanitary sewage. This paper ntended when new sewerage facilities are being anned, one must carefully weigh the advantages d disadvantages, both in ecological and onomic terms, of the two alternates, either: (1) ilding more costly separate sewer systems with e result that eventually treatment will be quired not only of the dry weather flow, but entually also the stormwater flows; or (2) build- a combined system with the necessary flow de- ntion or equalizing facilities that will permit eating not only the sanitary but also most of the rst flush flows in one plant and cleaning up the ormwater overflows by an appropriate process d equipment in another plant or plants. dentifiers: *Trenton(NJ).

ounded in 1679, Trenton is one of the nation's olest cities. Like most old cities, Trenton is conronted with the problem of an inadequate sewer ystem. Chambersburg, a section of Trenton, comrises one-seventh of the city's land area, but its ombined sewer system serves about one-half of ie city's population and major industries. The emainder of the city is provided with a separate ewer system. The existing sewerage system was escribed. A proposed program for eliminating ollution from the city's sewage system included nlarging an interceptor and constructing a detenon basin to store all combined sewage for later eatment. Calculations showed that this proposed rogram would keep water quality within acceptale limits for all but the highest rainfalls. (See also 76-09729) (Sims - ISWS)

A GUIDE TO THE SELECTION OF COST-EFFECTIVE WASTEWATER TREATMENT SYSTEMS,
Bechtel, Inc., San Francisco, Calif. Environmental Water Projects Dept.
R. H. Van Note, P. V. Hebert, R. M. Patel, C. Chupek, and L. Feldman.
Technical Report EPA-430/9-75-002, July 1975. 223 p. 115 fig., 8 tab., 44 ref. 68-01-1276.

Descriptors: *Sewage treatment, *Treatment facilities, *Economic efficiency, Costs, *Analytical techniques, *Cost comparisons, *Waste water treatment, Sludge treatment, Capital costs, Operating costs, Maintenance costs, Estimating, Amortization, Equations, Sludge disposal.

An aid to the identification of most of the wastewater treatment process sequences (other than land treatment and pond systems) currently available to meet point source federal and state discharge standards is presented. In addition to identifying a wide range of treatment alternatives available, guidance is given in further screening of alternatives as to their cost-effective potential, defined as that which will minimize total resources costs to the nation over time to meet water quality standards. Resources costs include capital (construction and lands); operation, maintenance and replacements; and social and environmental costs. A sewage treatment system may provide for wastewater reuse when the sale or net value from such reuse will, at a minimum, offset any additional costs to the system. Detailed are unit treatment processes which are illustrated by flow sheets; methods of cost determinations, cost curves for unit processes, factors other than cost to be considered in selecting unit processes; and calculation of capital and O and M costs, and total costs. Combined unit processes are defined and diagrammed. Procedures are given for use of the diagrams and for comparing alternative systems costs, with examples of cost-effectiveness comparisons of complete treatment systems. Appendices describe the unit processes, give cost formulae, and analyze cost effective guidelines. (See W76-09773 and W76-09774) (Auen-Wisconsin).
W76-09772

WASTEWATER SLUDGE UTILIZATION AND DISPOSAL COSTS,
Gates (W. E.) and Associates, Inc., Fairfax, Va.
T. G. Shea, and J. D. Stockton.
Technical Report EPA-430/9-75-015, September 1975. 16 p. 2 fig., 14 ref. EPA P5-01-205.

Descriptors: *Sewage treatment, *Sewage sludge, *Sludge disposal, *Cost comparisons, Amortization, Capital costs, Operating costs, Maintenance costs, Economic efficiency, Ultimate disposal, Transportation, Landfills, Estimating, *Waste water treatment.
Identifiers: Land spreading.

A series of cost relationships for five basic alternatives and two sub-alternatives of sludge disposal (the combination of sludge treatment processes and sludge transport and ultimate disposal methodologies) is presented with descriptions of the process and type of information used in creating these relationships. The variables considered are: sewage treatment plant flow rates varying from 1 to 1000 MGD; primary and secondary treatment; transport to ocean disposal by barging and land disposal by truck, rail, and pipeline; and land disposal by landfill and land spreading. Transport distances reflect those likely to be considered by Eastern Seaboard cities; barging transport costs apply to two situations--where all sludge can be loaded on a single barge loading station and where sludge is collected from a multiplity of loading stations. The material balances developed for the sludge 'flow' through the unit process trains in each alternative are based on 'tons of dry solids/day per MGD flow.' The assessment of the 288 sets of cost data develop a single-page graphical presentation allowing estimation, by alternative type of treatment, flow rate and type of distance of residuals transport, the capital costs, operating and maintenance costs, and total annual costs. The cost relationships are based on March 1975 dollars. (See also W76--09772) (Auen-Wisconsin).
W76-09773

COSTS OF WASTEWATER TREATMENT BY LAND APPLICATION,
Metcalf and Eddy, Inc., Palo Alto, Calif.
C. E. Pound, R. W. Crites, and D. A. Griffes.
Technical Report EPA-430/9-75-003, june 1975. 163 p. 41 fig., 15 tab., 61 ref., 4 append. 68-1-0966.

Descriptors: *Soil disposal fields, *Waste water treatment, *Cost comparisons, *Land use, *Estimated costs, *Economic efficiency, Water reuse, Capital costs, Operating costs, Maintanance costs, Amortization, Design, Benefits, Indirect benefits, Sewage treatment, Construction costs, Flow rates, Irrigation, Infiltration, Percolation, Overland flow, Application methods, Conveyance structures, Storage requirements, Distribution systems, Water rights.
Identifiers: *Land application.

Preliminary cost screening and detailed estimating methods for treatment alternatives involving land application of wastewater are presented. Estimates based on the preliminary data should generally be within 30% of actual costs; however, for conditions unfavorable to land application the variance could be more than 50%. Costs are divided into components, including total land area requirement, preapplication treatment, crop revenues, transmission methods, storage, application systems, and recovery of renovated water, with cost curves for each component relating to flow in mgd. The more detailed cost data enables the development of estimates for the most feasible treatment method, with cost curves for individual system components. These can easily be adjusted to reflect local and current conditions, and are expected to be accurate within 15% of actual costs. Alternative means of cost estimation are given for planting, cultivation, harvesting, yardwork, and relocation of residents. Also to be considered in cost effectiveness are revenue-producing benefits, such as sale of crops grown, sale of renovated water, sale of surplus effluent, land lease for irrigation and for recreation; and nonrevenue-producing benefits, such as social and environmental enhancement. The cost data base date is February 1973. (See also W76-09772) (Auen-Wisconsin).

DEVELOPMENT OF A DYNAMIC PROGRAMMING MODEL FOR THE REGIONALIZATION AND STAGING OF WASTEWATER TREATMENT PLANTS,
Utah State Univ., Logan.
S. L. Klemetson, and W. J. Grenney.
PRWA20-2, Utah Water Research Laboratory, College of Engineering, Utah State University, Logan, Utah, June 1975. 124 p, 25 fig, 34 tab, 81 ref, 3 append.

Descriptors: *Waste water treatment, *Treatment facilities, *Dynamic programming, Optimization, Regional development, Costs, Decision making,

Water quality control, Feasibility, Economies of scale, Timing, Model studies, Equations, Systems analysis, *Utah.
Identifiers: *Cost minimization, Staging, Lower Jordan River region(Utah), Capacity expansion, Sensitivity analysis.

Many cities and industries are faced with the problem of planning wastewater treatment for a growing society. Several treatment plants might be phased out to provide for a much larger regional plant with improved economies of scale in both capital and operation and maintenance costs. This research presents some criteria and a method for evaluating the timing and capacity expansion decisions for wastewater treatment facilities. Presented is a dynamic programming, economic decision model to be used as a management and planning tool by regional and local planners for the sequential expansion, upgrading, and regionalization of wastewater treatment plants at a minimum total discounted future cost. Parameters include the projected populations, wastewater quality and quantity, treatment efficiency requirements, interest rates, inflation rates, construction costs, operation, maintenance, and replacement costs, economies of scale, excess capacity, and service life. An analysis of the wastewater treatment needs of the Lower Jordan River region of Salt Lake and Davis Counties in Utah has been made using the available data. These results are then subjected to a sensitivity analysis of the input parameters. (Bell-Cornell)
W76-09845

SEWAGE TREATMENT SYSTEM,
Koehler-Dayton, Inc., New Britain, Conn. (Assignee).
R. B. Davis, and A. H. Cornish.
U.S. Patent No. 3,922,976, 2 p, 2 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 941, No 1, p 99, December 2, 1975.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, Water pollution treatment, Water pollution control, Water quality control, Solid wastes, *Incineration Odor.
Identifiers: Combustion, Maceration.

The sewage treatment system delivers sewage in the form of a fluid containing macerated solids to an exhaust stack or other combustion chamber for combustive reduction. The sewage is delivered to the exhaust stack only when the gases in the exhaust stack exceed a predetermined temperature. The solid portion of the sewage must be macerated into very fine particles to assure that combustion of the delivered sewage will be complete so that no solid residue or viable organisms will be discharged from the exhaust stack. To assure that there will be no residue or odor emitted from the stack, the sewage is delivered to the stack only when the temperature within the exhaust stack at the point of admission of the sewage is at least a predetermined temperature such as 675 deg F. The success of the system depends in great measure on the ability to supply the sewage to the combustion zone only when the solid component of the sewage has been macerated into very fine particles. This objective is achieved in the invention with the utilization of a positive displacement pump which includes a macerator unit and whill will discharge the macerated sewage at a flow rate far in excess of the desired flow rate to the stack. WATER TREATMENT PROCESS AND APPARATUS,
Gealer (Saul), Los Angeles, Calif. (Assignee).
H. K. Harms.
U.S. Patent No. 3,933,606, 7 p, 4 fig, 4 tab, 4 ref; Official Gazette of the United States Patent Office, Vol 942, No 3, p 1337, January 20, 1976.

Descriptors: *Waste water treatment, *Patents, *Water purification, *Electrolysis, *Water pollution treatment, Water pollution control, Water quality control, Flocculation, Bacteria.
Identifiers: Cyanide.

Contaminated water containing any combination of organic and inorganic suspended solids of whatever particle size, dissolved metal salts and cyanide is fed to the water treatment apparatus. The contaminated water pretreated prior to introduction into the apparatus by adjusting its pH to a range of from about 8.0 to about 10.0 by addition of an aqueous acid or base such as HCl or NaOH, as required, and by screening out gross particulate matter. The contaminated water is then fed to the column where it flows through the perforations in the plates and is exposed to the pulsating electrical signal supplied to the plates. The application of the pulsating electrical signal to the plates as the contaminated water flows through the column causes metal salts to precipitate from the solution, bacteria to be killed, and cyanide to be destroyed, and initiates formation of micro floc. The floc is then removed by clarification and filtering apparatus to yield essentially pure water and a sludge which may be further treated to recover metals and other valuable by-products. (Sinha - OEIS)
W76-09855

METHOD OF BIOLOGICAL PURIFICATION OF INDUSTRIAL EFFLUENTS FROM CHROMATES AND BICHROMATES,
V. I. Romanenko, S. I. Kuznetsov, and V. N. Korenkov.
U.S. Patent No. 3,941,691, 3 p, 1 ref; Official Gazette of the United States Patent Office, Vol 944, No 1, p 338, March 2, 1976.

Descriptors: *Patents, *Industrial wastes, Chemical wastes, Water purification, Domestic wastes, Water quality control, Water pollution control, *Water pollution treatment, Sewage treatment, *Biological treatment, Separation techniques, *Waste water treatment.
Identifiers: Chromates, Bichromates.

The industrial effluents to be treated which contain chromates and bichromates are delivered to an averaging reservoir where the content of chromium in the effluent is averaged, then the effluents are continuously fed to a sealed receiving vessel. The domestic sewage is first fed to a settler where large suspended matter settles to the bottom and the clarified sewage is continuously fed to the sealed receiving vessel. The amount of industrial effluents and domestic sewage entering the sealed receiving vessel is adjusted so as to have the amount of easily oxidized organic matter introduced with the domestic sewage at least 1.2 times higher than the amount of bound oxygen in the chromate or bichromate introduced together with the industrial effluents. The capacity of the sealed reservoir is calculated based on the time required for the chromate or bichromate to be biologically reduced. From the settler, the Bacterium dechromaticans Romanenko B-1167 is continuously fed into the sealed reservoir in amounts sufficient for the concentration of enriched culture to be maintained in the biological reducer to within 3 to 7 g per liter based on dry biomass matter. The mixture thus obtained of industrial effluents and domestic sewage together with the Bacterium dechromaticans Romanenko B-1167 culture is continuously stirred in the absence of air oxygen, then it is continuously fed to a settler tank where the Bacterium dechromaticans Romanenko B-1167 culture will settle, and the clear water free from chromates and bichromates is discharged. (Sinha-OEIS)
W76-09856

MEMBRANE SUPPORT-PLATES AND FLUID SEPARATING APPARATUS IN WHICH THEY ARE PRESENT,
Rhone-Poulenc, S.A., Paris (France). (Assignee).
B. Jamet, and J. Roget.
U.S. Patent No. 3,943,057, 5 p, 6 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 944, No 2, p 832, March 9, 1976.

Descriptors: *Patents, *Separation techniques, *Membrane processes, *Water purification, *Permselective membranes, *Waste water treatment, Water pollution treatment, Water quality control, Water pollution control.
Identifiers: Membrane support.

A membrane support-plate for fluid separating apparatus is provided. The support-plate comprises a number of substantially flat elements superposed in face-to-face relation and joined to one another in a leakproof manner, each flat element being substantially symmetrical relative to a median plane passing through its thickness. The invention also provides fluid separating apparatus including two end plates and a pipeline for feeding fluid to one of the end plates and a pipeline for removing fluid from the other of the end plates and a stack of membrane support-plates each having a membrane on each face. The apparatuses are suitable for any operations of separating fluids by selective permeability, whether these fluids are in gaseous or liquid forms and whether or not they contain suspended particles. OPEN-LOOP WATER-WASHABLE INSPECTION PENETRANT PROCESS,
J. R. Alburger.
U.S. Patent No. 3,949,601, 6 p, 1 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 945, No 2, p 613, April 13, 1976.

Descriptors: *Patents, *Industrial wastes, *Waste water treatment, Water purification, *Separation techniques, *Water pollution treatment, Water quality control, Water pollution control, Water pollution sources, Industrial production.
Identifiers: *Water-washable penetrants.

Test parts which are being inspected for the presence of surface crack defects are dipped in the water-washable penetrant and are allowed to drain. They are then washed with water to remove surface penetrant, leaving entrapments of penetrant in any crack defects which may be present. As a result, wash water which is employed for either the water-washable penetrant process or the Post-Emulsifier process contains considerable contaminants of emulsified or dissolved penetrant, and such contaminants have become an increasingly objectionable source of pollution in sewage systems or water disposal systems. The principal object of the invention is to provide a water-washable inspection penetrant process in which the penetrant is recovered for reuse, and the wash water is maintained at a low level of contamination acceptable for discharge into water-disposal systems. Certain types of low-solubility water-washable inspection penetrants, and which contain no detergent, are adaptable to a mode of usage whereby used penetrant separates from the wash water and floats to the surface of the water where it can be collected and re-used. The relatively pure water is drawn from the bottom of the holding tank and is discharged into a water-disposal system. (Sinha-OEIS)

IETHOD OF OPERATING A PURIFYING LANT AND TANK FOR PRACTICING SAID IETHOD,
lenzel and Co., Stuttgart (West Germany). Assignee).
. Porsch.
.S. Patent No. 3,951,758, 4 p, 2 fig, 7 ref; Official azette of the United States Patent Office, Vol 45, No 3, p 1333, April 20, 1976.

escriptors: *Patents, *Waste water treatment, Water purification, Water pollution control, Water pollution treatment, Water quality control, Sludge, Oxygenation, Ventilation, Air circulation, Application equipment.
Identifiers: Revolving tanks.

A method of operating a round reactivating tank for a purifying plant is described. The tank has a vertical axis and is adapted to receive a sludge-water mixture to be purified. The steps of the method are: revolving in the tank the sludge-water mixture to be purified; supplying the reactivating sludge flakes of the mixture in the tank with oxygen independently of revolving by introducing compressed air into the mixture along radial lines from adjacent the outer circumference inward toward the center; and increasing the volume of air outward from the center toward the circumference to force the mixture in the tank to carry out and maintain for a desired time a circular flow. The flow is substantially coaxial with the vertical axis and has a radially inward directed component adjacent the bottom of the tank and deflecting upward by a centrally positioned inclined surface. (Sinha-OEIS)

FURNACE FOR THERMAL TREATMENT OF LIQUID INDUSTRIAL WASTE WATERS CONTAINING TOXIC ORGANIC IMPURITIES (PECH' DLYA TERMICHESKOGO OBEZVREZHIVANIYA ZHIDKIKH PROMYSHLENNYKH STOKOV S TOKSICHESKIMI ORGANICHESKIMI PRIMESYAMI),
V. I. Brazhnikov, and P. A. Tikhanovskiy.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-783 850, $3.50 in paper copy, $2.25 in microfiche. Russian Patent No. 286983, 1971. 3 p, 4 fig. Translation prepared for Army Foreign Science and Technology Center, Charlottesville, Va.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Chemical wastes, *Water pollution treatment, *Water pollution control, *Water quality control, Gases, Heat, Condensation.
Identifiers: Combustion, Furnaces, Atomizing.

A furnace is described for thermal treatments of industrial liquid waste with toxic organic impurities. It consists of a vertical shaft with channels for introducing fuel and air, units for heating and atomizing industrial wastes and for cooling and removal of gaseous combustion products. The effectiveness of the furnace is achieved by installing units for separate introduction of fuel into the shaft and combustion units and by using additional combustion chambers which form individual zones along the height of the furnace. Units for atomizing industrial waste waters, for example atomizers, are situated along the perimeter at different heights of the furnace shaft and the liquid being atomized is directed opposite to the gas stream at an angle to the vertical. The furnace consists of a vertical shaft with independent combustion chambers situated tangentially and furnished with short-flame burners. The industrial liquid waste heated to a temperature of 70-95 deg C is fed under pressure into the atomizing sprayers located in two decks along the furnace height. Air is introduced in the form of fine jets. The burning and removal of impurities by calcination of industrial waste liquids present in vapor form is accomplished. The products of combustion are removed from gas outlet and low-melting salts which precipitate during the treatment process are melted and periodically discharged. On cooling the gases leaving the furnace condenses and the moisture can be used again. (Sinha-OEIS)

PRELIMINARY DESIGN OF A COMPREHENSIVE WASTE OIL PROCESSING FACILITY,
Environmental Quality Systems, Inc., Rockville, Md.
G. D. Gumtz, and E. J. Martin.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-242 461, $6.00 in paper copy, $2.25 in microfiche. Environmental Protection Agency Report No. EPA-670/2-75-056, May 1975. 133 p, 20 fig, 44 tab, 14 ref, append.

Descriptors: *Oil industry, *Waste water treatment, Facilities, *Pollutant identification, *Recycling, *Resources development, *Oil pollution, Pollutants, Maryland, Metals, Disposal, Sulfates, Halides, Quality control, *Treatment facilities.
Identifiers: *Waste oils, Oil recoveries.

A preliminary design was performed for a comprehensive waste oil recovery and disposal facility for the State of Maryland. The base for this design was an annual state-wide waste oil generation of 22,000,000 gallons which includes all known waste oil sources. With a 90% stream factor, feed to the plant is 66,000 gallons per day. The facility contains two major sections: (1) tank farm and (2) process plant. The tank farm is, in turn, composed of three major subsections: (1) receiving, (2) primary waste oil storage, and (3) product tankage. The comprehensive process plant has been designed to accept a wide range of waste oil types (crankcase, hydraulic, transformer, edible, etc.) and, potentially, provide multiple product oils (fuel, re-refined industrial, etc.). For this, it contains three major subsections: (1) adsorbent treatment, (2) solvent extraction, and (3) incineration. Basic processing will involve, in order, reagent addition and settling, flash distillation, adsorbent treatment followed by filtration, or sovent extraction followed by solvent recovery. Capital cost for this full-scale comprehensive facility is estimated at $5,700,000. Excluding collection, costs, overall system management, and major research and development, annual operating costs are estimated at about $2,331,000. Approximately 16,000,000 gallons of fuel oils and 500,000 gallons of lube oil base stock will be produced by this facility each year. Waste products generated include heavy metal particulates and calcium halides and sulfate. (Sinha-OEIS)

WASTE TREATMENT PLANTS,
Foster Wheeler John Brown Boilers Ltd., London (England). (Assignee).
R. J. Davies, and D. G. Blows.
United States Patent 3,954,605. Issued May 4, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 1, p 243, May, 1976. 1 fig.

Descriptors: *Patents, *Waste disposal, *Incineration, Domestic wastes, *Sewage treatment, Flocculation, *Waste water treatment.
Identifiers: *Shipboard wastes.

A method was patented for disposing of sewage wastes and domestic solid materials on a ship or in a remote land site using a fluidized bed incinerator. The solid material may be combustible, noncombustible, or a mixture. The sewage wastes first enter a reception zone. After collection in the reception zone, the wastes are passed to a macerator. Flocculation aids are introduced to the sewage wastes after maceration. The sewage wastes are passed to a zone for pressure aeration where air is dissolved into them under pressure. The sewage wastes are then passed to another zone and fine air bubbles are liberated, transporting solid particles which have flocculated to the zone's surface and separating the sewage into a clarified liquor and a pulp, which can be fed to the fluidized bed incinerator. The clarified liquor is disinfected and then reused on the ship or in the remote land site or passed to the incinerator. Part of the pulp is returned to the pressure aeration zone. The pulp not returned is passed to a feeding zone of the incinerator. The solid materials are passed to a pulverization zone and converted to incineratable form which can be fed to the incinerator's fluidized bed region. Combustion conditions are provided in the fluidized bed incinerator. The solid materials are passed to the feeding zone. The pulp and the solid materials are mixed in the feeding zone of the incinerator. This mixture is fed directly to the incinerator's fluidized bed region. Any oil waste from the remote land site or ship is introduced into the fluidized bed incinerator. (Snyder-FIRL)

PROCESS AND APPARATUS FOR THE INCINERATION OF AQUEOUS SEWAGE SLUDGE,
Myrens Verksted A/S, Oslo (Norway). (Assignee).
P. A. Loken.
United States Patent 3,954,069. Issued May 4, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 1, p 74-75, May, 1976. 1 fig.

Descriptors: *Patents, *Incineration, *Sludge treatment, Sewage treatment, Solids removal, Dewatering, Odors, *Waste water treatment.

A process and related equipment have been patented for incinerating aqueous sewage sludge, such as from community sewage treatment plants. The aqueous sewage sludge is mechanically dewatered to produce a wet sludge with high solids content. This wet sludge is indirectly heated and substantially dried in a heated drier, producing an exhaust gas containing water vapor and a dried sludge. The dried sludge is conducted to an incinerator for solid refuse. The exhaust gas is conducted through a condenser, condensing the water vapor and removing it, substantially drying the exhaust gas. This dry exhaust gas is conducted into the incinerator's combustion chamber. The exhaust gas is deodorized by heating with the aid of the hot combustion gases in the incinerator. (Snyder-FIRL)

A COMPARISON BETWEEN THE EFFICACY OF SUBMARINE OUTFALL DISPOSAL OF ADVANCED PRIMARY EFFLUENT AND CONVENTIONAL TREATMENT,
Trieste Univ. (Italy). Istituto di Idraulica e Costruzioni Idrauliche.
R. Olivotti.
Berichte der Abwassertechnischen Vereinigung e.V., No. 28, p 215-231, 1976. 2 tab, 55 ref.

Descriptors: *Waste water treatment, *Waste water disposal, *Pre-treatment(Water), *Outfall sewers, Nutrient removal, Viruses, Biochemical oxygen demand.
Identifiers: Marine outfalls.

The optimum choice of systems for treating and disposing of waste water in coastal areas depends on local circumstances. Types of systems frequently used include a long outfall preceded by pretreatment, a long outfall preceded by primary treatment, and biological treatment and chlorination followed by discharge near the coast. Advances which do not substantially change the problem's financial dimensions include the use of advanced primary treatment and following chlorination with dechlorination after biological treatment. Either of the latter two systems can usually meet a requirement that the 80th percentile be less than or equal to 100 fecal coliforms/100 cu cm. Viruses must also be considered as contaminats. Both of these systems can provide satisfactory protection against pollution by viruses, but outfalls must be longer than the current usual length. A long outfall preceded by advanced primary treatment is more effective against eutrophication. Both systems can result in satisfactory water quality near the outlet. Where the minimum prescribed treatment is not higher than advanced primary, either system may be used. The long outfall method, however, cannot be used where biochemical oxygen demand(BOD) standards are strict. Costs of the two systems are usually of the same order. Long outfalls preceded by advanced pretreatment are often preferable when concentrations of dissolved persistent toxicants meet specific standards and conventional 'full' treatment is not legally mandatory. Descriptors: Disinfection, *Ultraviolet radiation, Potable water, Public health, *Bacteria Enteric virus, Pesticides, Streptococcus, *Water treatment.
Identifiers: Colibacilli, Picornavirus, Poliovirus, *Vibrio-Cholerae.

The possibilities of using UV irradiation for disinfecting water, especially drinking-water are yet underestimated. Continuous and intermittent bacteriological trials on filtered and unfiltered river water showed that UV-rays are effective against colibacilli and fecal streptococci but less active against sulfite-reducing clostridia. Vibrio cholerae was completely inactivated by the procedure, and enteroviruses, such as poliovirus, were completely or almost completely inactivated.--Copyright 1975, Biological Abstracts, Inc.

MONITORING AND AUTOMATIC FILTER CONTROL OF THE DREIS-TIEFENBACK TREATMENT PLANT (BETRIEBSUEBERWACHUNG UND AUTOMATISCHE FILTERSTEUERUNG DER AUFBEREITUNGSANLAGE DREIS-TIEFENBACH),
H. Roesel, and H. Stein.
Wasser und Boden, Vol. 28, No. 4, p 76-79, 1976. 5 fig, 1 ref.

Descriptors: *Treatment facilities, *Water treatment, *Filtration, *Water works, *Control, Filters, Aeration, Chlorination, Oxygenation, *Monitoring, Automatic control.

The Dreis-Tiefenbach waterworks and its automatic filter control are described. Raw water obtained from a barrage and from groundwater is first aerated for oxygenation and for the partial removal of carbon dioxide. Suspended matter, iron, and manganese are removed in a first filter stage that uses such chemicals as aluminum sulfate, potassium permanganate, and aqueous lime. Quartz gravel is used for filtration. The water is treated with potassium permanganate, carbon dioxide and lime in a second filter stage composed of Jurassic chalk. In a final step, the water is chlorinated before distribution. THE CHEMISTRY OF OZONE IN THE TREATMENT OF WATER,
Hebrew Univ., Jerusalem (Israel). Graduate School of Applied Science and Technology.
M. Peleg.
Water Research, Vol. 10, No. 5, p 361-365, 1976. 1 tab, 50 ref.

Descriptors: *Ozone, *Water treatment, *Waste water treatment, *Organic compounds, *Kinetics, Analytical techniques, Phenols, Water chemistry, Reviews.
Identifiers: Hydroxyl radicals.

A review is presented of the chemistry of ozone in water and the potential disinfection efficiencies of ozone and its probable dissociation species in water. Ozone, an unstable gas that decomposes slowly in the gaseous phase to ordinary oxygen, will decompose at a greatly accelerated rate under thermal conditions. Knowledge of the mechanism and kinetics of the dissociation of ozone in water is uncertain. On the basis of several studies reviewed, the possible species to be found in aqueous ozone solution are 03, 0H, H02, 0-, 03-, and possibly the free oxygen atom if ozone decomposes before reacting with the water. Ozone has one of the highest oxidation potentials known, 2.07 V in acidic solutions and 1.24 V in basic solutions. Similar reactions of the hydroxyl radical and ozone have been noted. Both produce similar effects in the reduction of the organic carbon content of waste water effluents. Additionally, the ozonization of phenol in aqueous solution and the oxidation of phenol by OH both produce catechol and o-quinone as intermediate products. Investigations suggest that the dissociation products may be more powerful oxidation agents than ozone itself. Further experimental work is being performed in order to make more definitive statements about germicidal properties of ozone and its dissociation species in water. More work is needed on the effect of pH changes and increased catalytic decomposition of ozone on its disinfection ability. (Kramer-FIRL)

MODERN TECHNIQUES OF WASTE DETECTION,
East Worcestershire Waterworks Co., Bromsgrove (England).
R. H. Burch, and K. C. Marlow.
Water Services, Vol. 81, No. 960, p 179-182, March, 1976. 3 fig.

Descriptors: *Water treatment, *Distribution systems, Analytical techniques, Data collections, Sands, Flow rates, Pressure, Computers, Pollutant identification, Water supply, *Water conservation, *Waste identification.

The East Worcestershire Waterworks Company supplies water to a mixed rural and industrial community of about 300 sq mi. Until recently, sand from the wells from which most of this water is obtained entered the distribution system and eventually contributed to waste problems. Waste is defined as water supplied that cannot be accounted for in terms of legitimate domestic, metered, or bulk consumption. Waste dropped from 30% to 26% between 1963 and 1970, due to various water conservation measures. A new waste detection system was instituted in which a computer is used to compare flows at various points in the system. The system was divided into zones. Unusual demand in a zone is indicated by deviation of the solution of the zonal equation from known limits; sudden demands can be located within minutes. Every 24 hr, minimum night line figures are logged for all zones, to detect gradual waste increases. The equations consider losses or gains in reservoir levels in determining water consumption. Flow data is transmitted digitally, in units of 4546 liters for major source works and 455 liters for smaller flows. This system has reduced waste from 25% to 19% since 1971. The effect of pressure on waste level is also being studied. (Snyder-FIRL)

OPERATION OF OZONE TREATMENT APPARATUS (OZONE SHORI SOCHI NO UNTEN),
K. Takaya.
Suido Kyokai Zasshi (Journal of Japan Water Works Association), No. 497, p 38-49, February, 1976. 23 fig, 5 tab, 8 ref.

Descriptors: *Odor, *Ozone, *Water treatment, *Potable water, Rivers, Treatment facilities, Laboratory tests, Pilot plants, Costs, Waste water treatment.
Identifiers: *Japan, Deodorization.

The ozone treatment facility at the Kurashiki Water Works, Japan, for the deodorization of undesirable odors in the drinking water is described. The actual treatment facility was constructed after basic data collection at an experimental plant. The facility treated a maximum of 30,000 cu m/day river water which was first treated by a rapid filtration method, and entered into an ozone reaction bath. The residence time of water in the reaction bath was 3.3 minutes and a diffusion method for the ozone and water contact was employed. The

ozone absorption efficiency and the ozone level in the exhaust gas from the reaction bath agreed in both the experimental plant and the actual facility; ozonized air flow rate was 252 cu m/hr. With the ozone concentration in the flowing air at 1.5 ppm, ozone absorption efficiency by water was about 70% and ozone concentration in the exhaust gas was about 1.6 g/cu m air. Residual ozone from the reaction bath was treated with activated carbon. The dissolved ozone concentration in the water during winter treatment was almost twice that of summer treatment, due to water temperature. Treated water was stored in a pool before being sent into the water main and no residual ozone was found in the water of the water main. The deodorization effect achieved was a decrease in the threshold odor unit from 10 for the pre-treatment to 4 after the treatment. Operational costs of deodorization were 1 cent per cu m water. Dynek Corp., Port Chester, N.Y. (Assignee).
E. Stern.
U.S. Patent No. 3,950,253, 5 p, 3 fig, 11 ref; Official Gazette of the United States Patent Office, Vol 945, No 2, p 825, April 13, 1976.

Descriptors: *Patents, *Water purification, *Water treatment, *Filtration, Domestic water, Potable water, Water quality, Odor, Demineralization, Application equipment, Bacteria.

The invention provides an improved water filtration apparatus which is sufficiently economical in cost and operation to be suitable for domestic use. It has greatly improved effectiveness, and will substantially reduce the bacterial count of drinking water. It also has active filter media which are effective in removing all of the different types of major water contaminants. The apparatus includes a container for treating water and has a reservoir for storing untreated water. A pump has an inlet connected to pump water from the bottom of the reservoir and an outlet connected within the container to the inlet of a filter device also located within the container. The filter device includes an integral outlet spout for discharging the filtered water over the upper edge of the container. (Sinha - OEIS)

WORKING TOWARDS TOUGHER ODOUR CONTROL STANDARDS.
Process Engineering, p 95, February, 1976.

Descriptors: Odor, *Sewage treatment, *Waste water treatment, Municipal wastes, Food processing industry, Ozone, Oxygen, Standards.
Identifiers: Odor control, Odor control standards.

Due to anticipated stricter standards of control for odors from industrial and municipal sources, new technology is being considered in the United Kingdom. Available new equipment includes the high-efficiency KT fume scrubber from Plastic Constructions, a series of ozonators developed by Wallace and Tiernan, and Aeronca's closed-circuit drying system based on its Impinjet scrubber which could prove suitable for the control of escaping dust, vapor and odor. Detailed is the development of the Var 'wet' odor oxidation process using ozone. By scrubbing foul air with ozonated water, oxidation occurs and contact time is reduced to three seconds compared with 30 seconds for 'dry' ozonation. Ozone does not need to be applied in excess. The Var system is currently being installed at two sites near Edinburgh--the Seafield sewage treatment works and Leith Docks. It will be used to treat odors from sludge storage tanks at about 25,000 cu m/hr. The system is also suitable on an industrial scale for gases extracted from individual processes or as a high-volume polishing process on air extracted from an entire facility. A pilot scale test plant has been operating for over a year, treating the very difficult odor from a fish meal plant; performance has been reported to be very encouraging. (Kramer-FIRL)

COST EFFECTIVENESS OF RELEASE PREVENTION CONTROLS FOR TRITIUM AND KRYPTON-85,
International Atomic Energy Agency, Vienna (Austria).
J. J. Cohen.
In: Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment, Proceedings of a symposium held in Stockholm, June 2-5, 1975. IAEA-SM-197/17. p 285-298, 6 fig, 2 tab, 18 ref.

Descriptors: *Environmental effects, *Costs, *Control, Radioactivity effects, *Tritium, Krypton, Nuclear reactors.
Identifiers: *Krypton-85.

The study evaluates and compares potential effects of environmental releases of tritium and krypton 85 with the objective of placing exposure risks in perspective so that costs for release prevention may be related to and made commensurate with the potential hazard and so that cost effectiveness for controls may be established on an objective basis. Based on predicted environmental levels for both nuclides, the dose rate for the year 2000 is predicted. Tritium dose effects will be almost entirely due to natural sources and the residual tritium from atmospheric explosive testing. Any effort to minimize tritium exposure would have to be aimed at reducing tritium effluent. Since environmental krypton 85 is entirely anthropic, proper control measures to minimize its release might produce substantially lower future population dose levels over the next several decades. FIELD DRAINAGE WITH MANIFOLD WELL POINTS,
Agricultural Research Service, Weslaco, Tex.
R. J. Rektorik.
Transactions of the American Society of Agricultural Engineers, Vol. 19, No. 1, p 81-84, January-February 1976. 2 fig, 4 tab, 6 ref.

Descriptors: *Drainage systems, *Drainage wells, *Rio Grande River, *Texas, Water quality control, Aquifers, Plastic pipes, Well screens, Water table, Dewatering, Drawdown, Drainage, On-site investigations, Leaching, Cost analysis, Depth, Transmissivity, Storage coefficient, Pumping, Electric power costs, Centrifugal pumps, Reclamation, Root zone, Hydraulic gradient, Cathodic protection, Corrosion, Electrolysis.
Identifiers: *PVC, *Manifold well point system.

A field study of a manifold well point system was conducted in a highwater table, shallow aquifer in the lower Rio Grande Valley of Texas. The objectives of the study were to determine how effectively well point drainage systems work, how long they would last, their design, and their installation and operational cost. PVC pipe was used for the wells and manifold piping, and plastic screens were used for the well points. These materials

offer much resistance to both corrosion and electrolytic problems and, as such, show promise for a long service life. The cost of well point systems at about $250/ha is materially lower than the $370-500/ha for pipe drain systems. The design of well point systems depends on variations in aquifer parameters. Straight line configurations are most economical to construct but do not produce the most uniform drawdown. Water removal of about 0.26 l/s/ha provides adequate control of the water table in the study area and permits leaching of salts by irrigation or rainfall. (Visocky-ISWS)

THE DESIGN OF WATER QUALITY MANAGEMENT PROJECTS WITH INADEQUATE DATA,
Oklahoma Univ., Norman.
G. W. Reid.
In: Design of Water Resources Projects with Inadequate Data, Vol. 2, Proceedings of the Madrid Symposium, June 1973; Unesco - WMO - IAHS, Unesco - OMM - AISH, 1974, p 350-363. 3 fig, 2 tab, 7 ref.

Descriptors: *Water quality, *Management, Model studies, *Water pollution control, Projects, *Design, Equations, Decision making, Simulation, Equations, Systems analysis.
Identifiers: *Inadequate data, Submodels, Biodegradable model, Thermal model, Dispersed pollution model, Upstream use model, Streeter-Phelps equation.

One of the increasingly important elements in the design of water resource projects is the management of quality; an almost purely hydrological and hydraulic technology is being expanded to include the environmental and ecological impact areas and systems. Besides the interrelationships, flows and transports, the impacts on the living and nonliving water and peripherral environments need to be understood; ecological and water quality models must be developed. Unfortunately, there is rarely adequate data to properly describe these interrelationships. The methodology used for hydrological studies involving inadequate data such as the transfer of observed points to points of interest, short term intense studies, or use of simulation techniques, are being used in quality management modeling. In understanding data requirements using the system approach, the sequence of events are: (1) problem formulation; (2) symbolic modeling; (3) data collection; (4) analysis; and (5) design. Frequently, the order is changed. The complexities arise from an imperfect understanding of hydraulic, hydrological, chemical, biological, and ecological processes. Recognized is the superiority of an explicit quantifiable data and models over intuitive models and hunches. Suggested is a mental model, based on the mixture of incomplete information and intuition similar to most political decision making. A mathematical model deals with the same incomplete information available to an intuitive model, but through organization of information from many different sources into a closed loop. (Bell-Cornell)

REPORT TO THE CONGRESS BY THE NATIONAL COMMISSION ON WATER QUALITY,
National Commission on Water Quality, Washington, D. C.
March 18, 1976. 90 p.

Descriptors: *Federal government, *Water quality act, *Water quality control, Standards, Wastes, Water treatment, Irrigation, *Water quality standards.
Identifiers: *Public Law 92-500, *Interim law modification.

Experience during the three and one half years since enactment of Public Law 92-500, and the Commission's studies and evaluations' indicate that the Law requires 'mid-course adjustments' to keep the nation on a realistic course toward the objective of restoring and maintaining the physical, chemical, and biological integrity of the nation's waters. Recommendations include: (1) Maintain the July 1, 1977 deadline for compliance with uniform treatment requirements by both industry and publicly owned treatment works but with some flexibility, (2a) Maintain 1983 water quality goal, while postponing the 1983 requirements for application of uniform technologies five to ten years, (2b) Postpone, for not more than 10 years, 1983 interim water quality goal, and seek general application of the 1977 requirements, (3) Decentralize regulatory and administrative functions of the national programs by selective certification of states, (4) Stabilize the Federal construction grants program by assuring 75 percent Federal financing for priority treatment needs at a fixed amount, (5) Redefine the goal of elimination of discharge of pollutants as one stressing conservation and reuse of resources, (6) Authorize flexibility in applying control or treatment measures to irrigated agriculture after an inventory of the problem, and (7) support salinity alleviation projects to reduce salt loads from sources other than man's activity. (Heiss-NWWA)

EROSION CONTROL DURING PIPELINE CONSTRUCTION,
Yule, Jordan and Associates, Camp Hill, Pa.
L. R. Robinson, Jr.
In: National Symposium on Urban Rainfall and Runoff and Sediment Control; Proceedings of symposium held July 29-31, 1974, Lexington, Kentucky. Report UKY BU106, p 175-182, October 1974. 16 fig, 5 ref.

Descriptors: *Erosion control, *Pipelines, *Construction, *Pennsylvania, Sedimentation, Erosion, Regulation, Silts, Sediments, Filters, Channels, Spoil banks, Rainfall, Vegetation.
Identifiers: Straw filters, Stream crossings.

On September 21, 1973, the Pennsylvania Environmental Quality Board adopted an 'Implementation Plan and Regulations Dealing with Erosion and Sedimentation Control' which applies to all earthmoving activities in Pennsylvania. Federal and State criteria were used to develop an erosion and sedimentation control plan, as required by the new Pennsylvania regulations, to be used during pipeline construction during the 1973 construction season. Progress of construction and effectiveness of erosion control structures were monitored and pictorially recorded throughout the construction season. As evidenced by photographs and turbidity measurement, it was found that in most situations very little sediment left the site of pipeline construction. Straw bales placed across small streams and draws at critical road crossings and where bodies of water were to be protected, judicious use of pipe trenches and roadside ditches as sediment traps, utilization of the roughness and porosity of construction in the right of way as a runoff retardant, and vegetation alongside the right of way as a sediment filter provided satisfactory erosion control. IMPROVING WATER QUALITY BY CONTROL OF ALGAE: CELLULAR AND EXTRACELLULAR BLUE-GREEN ALGAL POLYSACCHARIDES,
Iowa State Univ., Ames. Dept. of Botany and Plant Pathology.
R. B. Wildman, W. C. Wildman, G. E. Rottinghaus, and B. L. Benner.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-254 614, $6.00 in paper copy, $2.25 in microfiche. Completion Report, Iowa State Water Resources Research Institute Ames, Completion Report, No. ISWRRI-74, December 1975. 119 p, 32 fig., 15 tab., 160 ref. OWRT B-039-IA(2), B-043-IA(1), 14-31-0001-3888/4084.

Descriptors: *Cyanophyta, *Nuisance algae, Algae, Plankton, Aquatic microorganisms, Aquatic algae, Aeration, Water quality, *Eutrophication, Lakes, *Iowa, Water pollution effects, *Pollutant identification, Anabaena, Nostoc, Hydrolysis, Gas chromatography, *Algal control.
Identifiers: *Extracellular products, *Polysaccharides, Aphanizomenon flos-aquae, Anacystic nidulans.

Lakes in Iowa were surveyed for blue-green algal blooms each summer from 1972 through 1975. Physicochemical and biological parameters of four lakes were measured each year during and following blue-green algal blooms of a single dominant species or two co-dominants in one case. One lake was studied for six months during periods of aeration and non-aeration. The ultrastructure of the life cycle of Aphanizomenon flos-aquae was followed in nature and in culture. The influence of strains of Anabaena cylindrica, Anacystic nidulans, and Nostoc muscorum on the pH and buffer capacity of culture media was observed. During periods of dense algal blooms, lake water was collected and processed for isolation of water-soluble organic material which was found to be polysaccharide. The corresponding bloom algae were processed to yield whole cell, wall, intracellular, and sheath (in two cases) polysaccharide fractions. The chemical composition of polysaccharides from lake water and algal fractions was determined by hydrolysis and identifica-

tion of component monosaccharides, using paper, thin-layer, and gas-liquid chromatography. Molar ratios of the component monosaccharides were determined. Polysaccharides of blue-green algae grown in culture were analyzed in the same manner. Studies were initiated on the relationship between blue-green algal bloom species and aquatic bacteria associated with them, particularly concerning the role of algal polysaccharides.

FINANCING POLLUTION ABATEMENT EQUIPMENT FOR TEXTILES AND OTHER SOUTH CAROLINA INDUSTRIES.
Clemson Univ., S.C. Dept. of Economics.
March 26, 1974. 107 p.

Descriptors: *Pollution abatement, *Financing, *Industries, *Bond issues, *South Carolina, Interest rates, Cost repayment, Taxes, Marketing, Legal aspects, Federal government, State governments, Legislation, Methodology.

The contributions to this seminar discuss various aspects of financing industrial pollution abatement facilities, with emphasis on interest rates and costs of pollution control bonds and industrial revenue bonds. A comprehensive discussion of the PCB as a financing instrument, the restrictions imposed upon it both by the investment community and by the IRS, and the versatility of PCB financing is presented. Several alternative state legislative options to finance industrial pollution control, with emphasis on South Carolina, are also presented. Contributions cover the methodology of PCB financing, the role of the underwriter in tax exempt financing for industrial expansion and pollution control, one company's experience with a political subdivision in South Carolina; and the use of tax exempt industrial revenue bonds to finance pollution control projects. All combine to present a detailed picture of the most advantageous financing method for pollution control by industries and municipalities. (See W76-09767 thru W76-09771) (Auen-Wisconsin)

PRESENTATION CONCERNING POLLUTION CONTROL FACILITIES REVENUE BONDS,
Sinkler, Gibbs, Simon and Guerard, Charleston, S.C.
T. B. Guerard.
In: 'Financing Pollution Abatement Equipment for Textiles and Other South Carolina Industries, March 26, 1974, Shrine Hall, Office of Professional Development, Clemson Univ., South Carolina, 15 p.

Descriptors: *Pollution abatement, *Financing, *Industries, South Carolina, Equipment, Facilities, Bond issues, Interest rates, Legislation, Textiles, Cost repayment.
Identifiers: Tax exemption.

South Carolina's approach to financing industrial pollution abatement facilities is encompassed by the Industrial Revenue Bond Act passed in 1967 and by the Pollution Control Facilities Revenue Bond Act of 1971, since the former did not clearly provide for financing for only air or water pollution control facilities. While the 1967 Act can finance pollution abatement facilities as part of a manufacturing plant being financed by bonds, there is no clear authorization to finance pollution abatement facilities independent of financing of the plant. The 1971 Act provides that pollution control facilities may include those designed both for the elimination or abatement of pollution and may be constructed as part of, and may include facilities also designed for, the recovery of chemicals or to serve some other commercially beneficial purpose, but which also contribute to pollution abatement. The primary purpose of financing under both of these acts is to obtain tax-free treatment of interest, and, as a result, reduced interest cost to the industry. The applicability of the Internal Revenue Code to tax exemptions for this type of financing is discussed, particularly if recovery processes are introduced with pollution abatement facilities. ROLE OF THE UNDERWRITER IN TAX EXEMPT FINANCING FOR INDUSTRIAL EXPANSION AND POLLUTION CONTROL,
Interstate Securities Corp., Charlotte, S.C.
C. B. Watson.
In: 'Financing Pollution Abatement Equipment for Textiles and Other South Carolina Industries,' March 26, 1974, Shrine Hall, Office of Professional Development, Clemson Univ., South Carolina. 7 p.

Descriptors: *Pollution abatement, *Financing, *Industries, *Bond issues, South Carolina, Taxes, Interest rates, Marketing.
Identifiers: Tax exemption, Underwriters.

The chief function of the underwriter is that of designing the financial package so that it not only meets the specific needs of his client, the corporation, but that it is also a marketable security. Revenue bond purchasers are generally fire and casualty insurance companies, banking institutions, bond funds, and high tax bracket individuals. In 1973 South Carolina issued $43.6 million in pollution control bonds, with interest rates ranging from 5.318% to 6.386%. The factors affecting interest rates are the financial strength of the lessee; the marketability of the bonds; the rating applied to the bonds; the sizes of the issuing company and issue; the company's industry segment; current market conditions; and the underwriter's expertise of how and to whom to market the issue. The underwriter often suggests that the corporation obtain a credit rating on its industrial revenue or pollution control issue, as rated bonds can lead to lower interest rates and generally have greater marketability than non-rated bonds. The investment banker's job also includes the presentation of various alternatives to the corporate executive and advice in the decision making to provide the lowest available interest cost and simultaneously obtain optimum profitability. THE INDUSTRIAL REVENUE BOND FOR POLLUTION CONTROL: ONE COMPANY'S PERSPECTIVE,
La France Industries, S.C.
J. E. Haller.
In: 'Financing Pollution Abatement Equipment for Textiles and Other South Carolina Industries,' March 26, 1974, Shrine Hall, Office of Professional Development, Clemson Univ., South Carolina. 10 p.

Descriptors: *Pollution abatement, *Financing, *Bond issues, *Industries, Facilities, Textiles, South Carolina, Interest rates, Taxes, Local governments.
Identifiers: Industrial revenue bonds, Tax exemption.

The procedure involved in financing pollution abatement facilities by industrial revenue bonds at the Riegel Textile Corporation, operating in two counties of South Carolina, is described. The bonds are issued by the respective county and are secured by the facility acquired with the proceeds from the bonds. Interest on the bonds and redemption are dependent upon the revenue coming from the user of the facility. The federal and state codes provide that if all of the proceeds of the bond issue are used to provide water or air pollution control facilities, interest paid on the obligation are free of income taxes consequently reducing the interest rate on the bonds. The money is deposited in a construction fund account and is disbursed upon presentation of bills which Riegel certified were for the construction of the facilities. The county executes a Pollution Control Facilities Revenue Note which provides a repayment schedule and also provides that it is a limited obligation of the county and is payable solely out of monies derived by the county from Riegel and does not constitute a pecuniary liability of the county. FINANCING POLLUTION CONTROL PROJECTS IN SOUTH CAROLINA USING TAX-EXEMPT INDUSTRIAL REVENUE BONDS,
Spring Mills, Grace, S.C.
W. A. Moore.
In: 'Financing Pollution Abatement Equipment for Textiles and Other South Carolina Industries,' March 26, 1974, Shrine Hall, Office of Professional Development, Clemson Univ., South Carolina. 7 p.

Descriptors: *Pollution abatement, *Financing, *Industries, *Bond issues, Methodology, South Carolina, Taxes, Amortization, Interest rates, Costs.
Identifiers: Tax exemption.

The vehicle chosen by the Springs Mills, Inc., to finance the pollution abatement facilities at their Grace Finishing Plant in South Carolina was tax-exempt industrial revenue bonds issued by a political subdivision (Lancaster County) but unconditionally guaranteed by the firm. The agent was an investment banking firm who proposed a 20-year serial bond issue at an attractive interest rate. Involved in the process were the company whose credit secures the bonds; the county issuing the bonds; and independent bond counsel who verified the tax-exempt status of the bonds; and the underwriters who distribute them. An interim loan agreement was entered into with the county as this form of agreement allowed the firm to retain ownership of the facilities at all times. The State Board of Health and Environmental Control must also approve the project (after rating the bonds) because of the pollution control aspects; the approval is followed by a 20-day public notice. The trust indenture was finalized following approval of the prospectus. This indenture provides terms for disbursing and receiving funds involved in the issue. The bonds were then sold and the funds were turned over to the trustee for disbursement to the issuing authority who will receive repayments of principal and interest from the company. THE POLLUTION CONTROL BOND,
Clemson Univ., S. C. Dept. of Economics.
J. J. Glocker.
In: 'Financing Pollution Abatement Equipment for Textiles and Other South Carolina Industries,' March 26, 1974, Shrine Hall, Office of Professional Development, Clemson Univ., South Carolina. 59 p. 6 tab.

Descriptors: *Pollution abatement, *Bond issues, *Financing, Industries, Legal aspects, Marketing, Taxes, Interest rates.
Identifiers: *Pollution control bonds, Tax exemption.

The comparatively recent entrance of the pollution control bond (PCB) as an industrial debt instrument to finance pollution abatement facilities, its history, its flexibility, the discord it has caused in the investment community, its marketing problems, and the IRS restrictions on its tax exempt status, are discussed. For the larger company, with established credit rating and a massive cleanup job, the PCB is the cheapest money around. The widely offered incentives of state property exemptions can also generate substantial savings. The advantages of a regional treatment facility, as exemplified by the Gulf Coast Waste Disposal Authority, servicing 140 plants on the Houston Ship Channel, are that they can shift poi-

ıtion control responsibility to a public agency esulting in immunity from prosecution; compaies can also enjoy a 10 to 25% cost saving accrug from economies of scale as well as tax exempt nancing and exclusion from property taxes on ıe facility. The Ohio Water Development uthority is cited as an example of comprehensive nd well designed legislation to provide help to oth industrial and local governmental agency prorams. Among other aspects of PCB financing iscussed, is the dichotomy between the IRS point f view of the PCB tax status regarding recycling r reclaiming byproducts and EPA's conservation bjective. CONOMIC ANALYSIS OF EFFLUENT UIDELINES: GRAIN PROCESSING SEGMENT F THE GRAIN MILLS INDUSTRY,
evelopment Planning and Research Associates, ıc., Manhattan, Kans.
. G. Unger, and M. W. Wjolverton.
vailable from the National Technical Informaon Service as PB-240 196, $7.50 in paper copy, 2.25 in microfiche. Report EPA-230/2-74-014, ebruary 1975. 186 p. 6 fig., 63 tab., 27 ref. 68-01-533.

escriptors: *Economic impact, *Water pollution ontrol, *Food processing industry, Corn(Field), ice, Wheat, Prices, Costs, Employment, Waste ater treatment, Standards, Effluents, Industrial roduction, Employment, Regional economics, inancing.
lentifiers: *Grain milling industry, Flour milling, ice milling, Corn milling.

he structures of the corn wet milling, corn dry illing, bulgar processing, and parboiled rice illing segments of the grain milling industry are nalyzed with respect to the impact of the 'best racticable technology,' 'best available technolo-y' and 'new source performance standards' of ollution abatement on financing, production, emloyment, community impact, and foreign trade. ince most of the plants discharge into municipal ystems whose treatment processes are adequate control pollution, these segments of the indus-y are not likely to experience severe economic npacts through imposition of treatment stanards; many effects would be minimal and would e important only on an individual plant basis. ery few corn wet milling plants discharge rectly to surface water. Individual plant waste chnology is such that no plant need close ecause of pollution controls. The only difficulty at pollution control will impose on these industry gments may be one affecting growth as mucipal treatment systems may prove inadequate to ceive large quantitative increases in wastewater. orn dry milling plants will also be only marginally fected by pollution control costs. Their present ofitability, financial conditions, and production chnologies are sufficient to absorb those costs hich cannot be passed through to purchasers. All isting bulgur and parboiled rice plants discharge to municipal systems. (Auen-Wisconsin)

ATER USE POLICIES AND POWER PLANT CONOMICS,
ouston Univ., Tex.
. Inoue, E. J. Henley, G. H. Otto, and R. G. ıompson.
vailable from the National Technical Informaon Service, Springfield, VA 22161, as PB-239 2, $5.50 in paper copy, $2.25 in microfiche. Reort No. NSF-RA-B-74-014, June 1974. 122 p. 39 ., 5 tab., 32 ref., 7 append. NSF (RANN) 34459.

escriptors: *Water policy, *Electric power costs, Cooling towers, *Water utilization, Cooling ater, Electric power production, Optimization, axes, Operating costs, Water treatment.

How a water withdrawal tax of from 0 to 2 cents/1000 gal; a heat discharge tax of from 0 to 20 cents/10 million BTU; a temperature differential constraint between cooling water discharge temperature and reservoir temperatures of 5 to 20 deg F; and various heat discharge constraints relate to water use and water quality and to the cost of generating electric power and the demand for cooling water, are compared. The effects of these policies and/or combinations (totaling six) on the price of power are computed for a 500,000 KW prototype plant operating at 2000 boiler pressure and 1050 deg F on a once-through cooling system, a closed cycle wet tower cooling system, an open cycle wet tower cooling, and a dry cooling tower system. Each policy variable was changed and the power cycles and cooling systems were reoptimized to find the cooling system and operating conditions which produce the lowest cost power. The stack gas scrubber and the water treatment plant are not explicitly included in the cost and operation equations developed. The computations were based on a parametric search of 19-key designs. (Auen-Wisconsin).

ECONOMIC ANALYSIS OF EFFLUENT GUIDELINES: FERTILIZER INDUSTRY,
Development Planning and Research Associates, Inc., Manhattan, Kans.
M. L. David, J. M. Malk, and C. C. Jones.
Available from the National Technical Information Service, Springfield, VA 22161, as PB-241 315, $7.75 in paper copy, $2.25 in microfiche. Report No. EPA-230/2-74-010, January 1974. 221 p. 9 fig., 74 tab., 2 append. 68-01-1533

Descriptors: *Water pollution control, *Economic impact, *Industries, *Fertilizers, Effluents, Standards, Pricing, Employment, Regional economics, Industrial production, Financing, Return(Monetary), Costs, Foreign trade, Analysis.
Identifiers: Nitrogenous fertilizers, Phosphate fertilizers, Financial analysis.

Based on 1972 conditions and model plant data, the effects of 'best practicable technology' (BPT), 'best available technology' (BAT), and 'new source performance standards' (NSPS) of pollution control are evaluated. It is concluded that the larger companies of the nitrogenous and phosphatic fertilizer segments of the industry will be able to finance new investment in pollution control facilities; smaller companies may find new investment difficult or impossible. Small ammonium nitrate plants may be impacted severely, with over half of the plants and about one-third of capacity possibly shut down. Small diammonium phosphate (DAP) plants may also suffer severly, with just over one-quarter of the capacity affected. Other segments of the fertilizer industry are expected to be impacted much less severely. NSPS may cause some delay in the construction of medium-sized DAP and triple superphosphate plants, but expected higher prices would probably make such plants profitable. NSPS will probably not be a deterrent in the other segments. Total estimated employment losses due to pollution control range from 490 to 1620 jobs with payrolls of $5.9 to $19.4 million, but closures are not expected to impact any one area of the country. Price increases due to pollution abatement would be relatively small in relation to normal swings in export prices with negligible effect on the balance of payments. (Auen-Wisconsin).
W76-09777

SECONDARY EFFECTS OF PUBLIC INVESTMENTS IN HIGHWAYS AND SEWERS.
Environmental Impact Center, Inc., Newton, Mass.
Available from the National Technical Information Service, Springfield, VA 22161, as PB-240 332, $6.00 in paper copy, $2.25 in microfiche. Report EOC 3172deffl, February 1975. 148 p. 18 fig., 26 tab., 19 ref. EQC 317

Descriptors: *Government finance, *Highway effects, *Sewerage, *Land use, Urbanization, Econometrics, Model studies, Regional economics, Zoning, Regression analysis, Regional development, Third party effects, Computer programs.
Identifiers: Case studies, Washington(DC), Boston(Mass), Denver(Colo), Minneapolis-ST. Paul(Minn).

Econometric techniques for forecasting secondary effects of highway and sewer construction on land use patterns of metropolitan regions are described. Data were collected on the amount and location of single and multi-family unit construction, together with commercial and industrial land development at Washington, D.C., Boston, Denver, and Minneapolis-St. Paul and related by regression analysis to sewer service availability, proximity to major highways, amount of vacant land, residential vacancy rate, and land market conditions. The statistical analysis was tested by a dynamic model applied to Washington, D.C. The relative importance of each factor varied substantially between regions. Although several types of development were affected, the greatest influence of sewer investment appeared to be on the single-family housing construction in all areas studied. A greater influence of sewers is anticipated with stricter water pollution control. The effect of new highways on various types of development was marginally dependent on preexisting highways. The study shows that quantitative techniques can be developed for specific regions, which would allow project planners to estimate the magnitude and type of likely secondary effects associated with proposed infrastructure investments. The suggested approach is to develop a set of equations reflecting the particular conditions and circumstances applicable to the specific region. (Auen-Wisconsin).
W76-09778

ECONOMIC ANALYSIS OF EFFLUENT GUIDELINES: APPLE, CITRUS AND POTATO PROCESSING SEGMENTS OF THE CANNED AND PRESERVED FRUITS AND VEGETABLE INDUSTRY,
Development Planning and Research Associates, Inc., Manhattan, Kans.
D. J. Wissman, D. L. Jordening, and S. G. Unger.
Available from the National Technical Information Service, as PB-240 195, $8.00 in paper copy, $2.25 in microfiche. Report EPA-230/2-74-012, February 1975. 224 p. 93 tab. EPA 65-01-1533.

Descriptors: *Economic impact, *Food processing industry, *Water pollution control, *Pollution abatement, Apples, Citrus fruits, Potatoes, Effluents, Standards, Capital costs, Waste water treatment, Operating costs, Employment, Financing, Pricing, Return(Monetary), Regional economics, Asparagus, Foreign trade.
Identifiers: Fruit processing, Vegetable processing.

The canning and freezing segments of the industry consist of 36% small, 29% large, and 10% very large firms, with the large, multiproduct plants increasing their percentage of production. In general, industry concentration--when measured by value of shipments--is greater for the canned and dehydration segments than for the frozen fruit and vegetable segments; between 1963-1970 the larger frozen food firms have increased their share of output. Overall employment is trending downward in the canning segment but almost doubling in the freezing segment. Smaller and some of the medium-size plants may not be able to survive the added costs of pollution abatement. A synthesized analysis of cost and return data projects economic data for a 20-year period, showing estimated pollution abatement costs, with and without internal waste treatment. There is apparently available capital to finance pollution control for large and medium-sized canners, and especially freezers. However, individual plants and

local considerations may have unique overriding conditions that prelude financing. If the industry successfully passes pollution abatement costs to consumers, the price increases would have little impact on consumption patterns. The impact of the imposition of effluent standards on the citrus and apple segments are detailed under price, financial, production, employment, community, and other effects. (Auen-Wisconsin).
W76-09779

ECONOMIC ANALYSIS OF EFFLUENT GUIDELINES: INSULATION FIBERGLASS INDUSTRY.
Environmental Protection Agency, Washington, D.C. Office of Planning and Evaluation.
Available from the National Technical Information Service, Springfield, VA 22161, as PB-240 649, $4.50 in paper copy, $2.25 in microfiche. Report EPA-230/2-74-011, January 1975. 49 p. 5 fig., 8 tab.

Descriptors: *Water pollution control, *Economic impact, *Thermal insulation, *Industries, Effluents, Standards, Waste water treatment, Costs, Prices, Employment, Foreign trade, Regional economics , Financing, Return(Monetary), Industrial production.
Identifiers: *Wool fiberglass industry.

The cost of water pollution control (zero discharge-water recycle) in wool fiber glass plants varies from 0.18 to 1.15 cents/lb of glass wool produced and is sensitive to plant capacity. The incremental capital investment cost is 1.3 to 3.8% of current plant investment and any increase due to pollution abatement will be modest and not likely to increase prices. However, if operating costs increase concurrently, the cumulative total might become significant. With no price increases, those plants with current return on investment of 10-15% or greater will continue to enjoy good returns. Investment cost for water pollution control-recycle is 1.25 - 3.75% of current plant investment which will be expended over three years. The annual expenditures for water treatment and recycle are modest and will not have any significant impact on normal capital expenditures of major companies. The supply/demand projections indicate that pollution abatement expenditures will not affect production. No plant shutdown is likely to occur; rather one major producer plans to increase capacities in spite of additional abatement cost. Glass wool exports represent about 2% of production and pollution abatement costs will not influence import/export markets. No effects on unemployment in the industry or secondary effects on communities are anticipated. (Auen-Wisconsin).

METHOD AND COMPOSITION FOR PREVENTING WATER CONTAMINATED WITH INDUSTRIAL WASTE FROM SEEPING THROUGH SOIL CONTAINING SAID WATER,
American Colloid Co., Skokie, Ill. (Assignee).
A. G. Clem.
U.S. Patent No. 3,949,560, 4 p, 7 ref; Official Gazette of the United States Patent Office, Vol 945, No 2, p 599, April 13, 1976.

Descriptors: *Patents, *Industrial wastes, *Seepage control, *Settling basins, *Confined water, *Water pollution treatment, *Water quality control, *Water pollution control, Bentonite, Impervious soils, Chlorides, Sulfides, Sulfates, Polymers, Soil dispersants.

A method is provided for forming lagoons and other water-holding areas which will not allow seepage of water containing inorganic water-soluble industrial waste compounds. A mixture of soil and a soil sealant composition composed of bentonite, a water-soluble dispersing agent, and a water-soluble polymer are used to form a water containing enclosure. The bentonite is prevented from disintegrating when contacted with water containing water-soluble industrial waste compounds such as inorganic water-soluble chloride salts, sulfate salts and sulfite salts by the use of the water-soluble dispersent and a water-soluble polymer. The water-soluble dispersent can be a water-soluble salt of phosphoric acid such as hypophosphate, orthophosphate, metaphosphate, and pyrophosphate. The preferred water-soluble polymer is polyacrylic acid. (Sinha-OEIS)
W76-09858

COMBINATION PROVIDING SAFETY BERTHING, UNLOADING OF OIL, AND CONDUIT CARRIAGE TO REFINERIES ON LAND, OF LARGE DEEP-SEA-REQUIRING TANKERS,
Parson, Brinkerhoff, Quade and Douglas, Inc., New York. (Assignee).
C. J. Murphy.
U.S. Patent No. 3,950,805, 4 p, 19 fig, 10 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1024, April 20, 1976.

Descriptors: *Patents, Engineering structures, *Environmental effects, *Water pollution control, *Oil industry, Abatement, Pollution abatement, Water quality control, Conduits, Pontoons, Continental shelf.
Identifiers: *Outer Continental shelf, Tankers, Oil tankers, Mooring, Offshore technology.

A subaqueous conduit extends from a mainland terminal and leads to the base of a tubular mooring stanchion which extends above the sea surface. The base of the stanchion is located at a depth of up to 100 fathoms adapting the stanchion for the mooring of very large oil tankers. Secured to the stanchion is a double floating pontoon structure to which tankers can berth. The tankers are moored alongside the pontoon structure and discharge their oil through swivel-jointed tubes at the upper portion of the stanchion which permit relative motion of the tanker caused by sea conditions. The pontoon structure can be ballasted to submerge to a predetermined depth during adverse weather conditions. The stanchion may receive oil from two tankers simultaneously and is adapted for connection to a plurality of submarine conduits by which oil from the stanchion may be received at a number of land-based reception points. (Sinha - OEIS)
W76-09865

APPARATUS AND METHOD FOR RECOVERING PURE WATER FROM NATURAL SOURCES AND INDUSTRIAL POLLUTED WASTE SOURCES,
S. L. Ross, and O. Shuffman.
U.S. Patent No. 3,951,198, 5 p, 5 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1153, April 20, 1976.

Descriptors: *Patents, *Industrial wastes, *Gases, *Air pollution, *Reclaimed water, Water sources, *Condensation, Generators, Potable water, Condensers.
Identifiers: Thermal energy generators.

A method and apparatus is described for purifying industrial waste gases in order to avoid polluting the atmosphere and to produce comparatively pure water. The waste gases are first cooled and then passed to a waste gas purifier unit from which the waste gases are circulated between the outer wall of the waste gas purifier and a surrounding insulated duct prior to exhausting to the atmosphere, with the liquid waste from the waste gas purifier being conducted to a liquid collection means and then to a thermal energy generator for the produ tion of super-heated steam that is subsequentl condensed to produce comparatively pure wate The apparatus includes an in-line condenser f reducing the temperature of the industrial was gases prior to being conducted to the waste gas p rifier. The solid particulate matter of the industri waste gases are collected in suitable disposal co tainers. (Sinha - OEIS)

ASSESSING POTENTIAL OCEAN POLLU TANTS,
National Academy of Sciences, Washington, D.
A Report of the Study Panel on Assessing Pote tial Ocean Pollutants to the Ocean Affairs Boa Commission on Natural Resources, Nation Research Council, 1975. 438 p, numerous tab a ref.

Descriptors: *Water pollution, Resourc development, Pollutant identificatio *Environmental effects, *Waste disposa *Nuclear wastes, Continental Shelf, Toxicity, I dustrial wastes, Iron, Copper, Metals, Organ compounds.
Identifiers: *Outer Continental Shelf, *Ocea dumping, Medical wastes, Environmental impac Tetracyclines, Technetium, Chlorinated hydroca bons, Aromatic hydrocarbons, Metallic wastes.

The purpose of this study was to develop and te a method for reviewing technologies with a pote tial impact on marine systems, and to determi whether they clearly pose a potential hazar whether they are clearly unimportant, or wheth they fall into an intermediate category and ne further study. Six groups of materials we selected for study: transuranic elements; synthe organic chemicals; ocean discharges; metal wastes; medicinal wastes; and marine litter. T study proved successful and some definite concl sions resulted. Two of the materials studied

ransuranic elements and hexachlorobenzene--
ere identified as clear potential problems, at least
hen the present limited production is projected
nto the future. Others; low molecular weight
hlorinated hydrocarbons (LMCH's),
crylonitrile, iron and copper wastes, open ocean
tter, tetracycline, and technetium; present no
emonstrable hazard to open ocean ecosystems at
resent or foreseeable levels of release. In the
emaining cases (aromatic hydrocarbons, certain
umped chemicals, and inshore litter) it was
nought that some local adverse effects were
ossible, but the area of uncertainty could be nar-
owed and the information required to determine
ffects was specified. A general conclusion of this
tudy is that many potential ocean pollution
roblems can be assessed by a detailed review fol-
owed by a limited number of well-planned mea-
urements. (Sinha-OEIS)

esign test and evaluation of a 600 gpm oil-water
parator for ballast water treatment is docu-
ented. The basis of the particular separation con-
pt resides in the use of a very thick, open reticu-
ted, oleophilic foam which is capable of separat-
g the dispersed oil phase from the aqueous con-
uous phase independently of the oil density and
hich is amenable to regeneration by simple ex-
ession. Separation of the oil phase in the oleo-
ilic foam body occurs as a result of filtration, re-
tention and coalescence processes that are discussed in detail. Extensive scavenging and regeneration laboratory tests demonstrated the technical feasibility of a unit in which both processes, separation and regeneration, were performed on a batch basis. During the second phase the conceptual design of a Batchwise In-Situ Regenerated Separator (BIRS) cell and the construction of a 40 gpm bench scale unit for laboratory testing with simulated ballast water was undertaken. Excellent oil separation results were obtained with this unit under a wide variety of operating conditions and contaminant characteristics. The operation manual is incorporated as an appendix.

RECOMMENDED PROCEDURE FOR DEVELOPING DEEPWATER PORTS DESIGN CRITERIA,
Coast Guard, Washington, D.C. Office of Marine Environment and Systems.
Department of Transportation, Office of Marine Environment and Systems, Deepwater Ports Project, Report, Recommended Procedure for Developing Deepwater Ports Design Criteria, 1975. 11 p.

Descriptors: *Design criteria, *Environmental effects, Resources development, Water resources, *Water pollution sources, *Water quality control, Continental shelf, *Ports, Winds, Waves(Water), Currents(Water), Seiches, Tides, Visibility, Temperature, Ice, Protection.
Identifiers: *Deepwater ports, *Superports, Environmental protection, Environmental impact.

The provisions of these procedures are intended to establish methods for defining the environmental conditions which will affect operations at the site and which must be considered in establishing design criteria for all fixed marine and floating components (except hoses) of a deepwater port. Included also is a list of applicable laws concerning protection of the environment. The design criteria treated in this paper are concerned with waves, wind, currents, seiche, tides, visibility, temperature, and ice. In dealing with design loads attention is given to operating mooring loads, operating hawser loads, operating anchor loads, and storm loads. (Sinha - OEIS)

Identifiers: *Outer Continental Shelf, *Beaufort Sea, *Artificial islands, Environmental impact, Mackenzie Delta, Prediction, Scouring.

A multi-million-dollar environmental research program consisting of 33 wildlife, biological, oceanographic, meteorological, sea ice and oil clean-up studies related to the southern Beaufort Sea is described. The studies are designed to provide ecological baselines, a better understanding of the physical environment, knowledge related to the consequences of a possible oil spill and means of oil clean-up in ice-infested waters. Seasonal offshore drilling in the Canadian Beaufort Sea from a floating vessel has been approved in principle and is scheduled to be undertaken during the open-water period of 1976. The results of the studies discussed will be used to set operating constraints to safeguard the environment and minimize any adverse impact. The hostile environment is briefly described and problems arising during one of the worst ice seasons on record are discussed. The scope of the studies, research methods and progress to date in individual studies are outlined and, where possible, results are provided. An important phase of the program is public interface to inform northern natives, government, those with environmental concerns and others about the program and the study results. (Sinha-OEIS)

THE ERADICATION OF THE SEAWEED SARGASSUM MUTICUM FROM BRITAIN,
Portsmouth Polytechnic (England). Dept of Biological Sciences.
W. F. Jones, and E. B. Gareth.
Biol Conserv. 6(1), p 57-58, 1974.

Descriptors: *Aquatic weed control, Ecosystems, Intertidal areas, Shallow water, Europe, Floating plants.
Identifiers: Britain, Japan, *Sargassum-Muticum, *Seaweed eradication.

Studies indicated that S. muticum, accidentally introduced from Japan to the intertidal lagoons of

the Isle of Wight and Portsmouth Harbor, can drastically change the ecosystem of shallow coastal waters by reducing species diversity. Free-floating masses of detached Sargassum annoy fishermen, boaters and swimmers. Volunteers were sought to pick the plants by hand at regular intervals until all larvae, sporelings and adult plants are eliminated from the area.--Copyright 1974, Biological Abstracts, Inc.

Identifiers: Chironomus-Stigmaterus, Procladius-Sp, Tanypus-Grodhausi, Tanytarsus-Sp.

In laboratory, Altosid (isopropyl 11-methoxy-3,7,11-trimethyldodeca-2,4-dienoate) was the most effective compound tested against OP(organophosphate)-resistant and susceptible Chironomus species. This material also was effective against larvae of C. stigmaterus Say and Tanypus grodhausi (Sublette) taken from sewage oxidation ponds and treated in the laboratory. Two slow-release encapsulated flowable formulations of Altosid at 0.2 and 0.1 ppm concentration showed excellent activity against midges of the genera Chironomus, Procladius, and Tanytarsus in small box plots and in field breeding ponds. Both proved superior to the emulsifiable formulations in terms of initial suppression and residual activity. The 2 slow-release and EC (emulsifiable concentrate) formulations were studied in a warm-water lake (5-6 ft deep) where 4-8 acre portions were treated. Slow-release formulations produced good to excellent inhibition of emergence of adults for a period of 1-2 wk. The 10% slow-release greater initial and short-term inhibition of emergence at 0.25 lb/acre AI(active ingredient) than 0.1 lb/acre. EC-formulation yielded lower initial and short-term inhibition of emergence than the 10% slow-release forulation.--Copyright 1974, Biological Abstracts, Inc.

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

ENERGY MODELING AND FORECASTING.
California Univ., Berkeley. Lawrence Berkeley Lab.
Proceedings of the Conference on Energy Modeling and Forecasting, June 28, 29, 1974, Lawrence Berkeley Laboratory, University of California, Berkeley, California. 170 p, 20 fig, 28 tab, 160 ref, 2 append. Benenson, P., Ruderman, H., Merrill, D., and Sathaye, J. (Eds.).

Descriptors: *Energy, *Forecasting, *Methodology, *Model studies, Demand, *Economics, Oil, Environment, Fuels, Supply, Systems analysis, Technology, Simulation analysis, Decision making, Optimization, Water resources, Reservoirs.
Identifiers: Econometrics.

Presented are the proceedings of a conference on methodology in energy modeling and forecasting. The objectives of the conference, held at the Lawrence Berkeley Laboratory, were to evaluate the suitability of present modeling techniques for responding to energy policy questions and to explore approaches for improving each method. Each of the participants in the small but diverse group presented a paper and then a discussion followed, focusing on the strengths and weaknesses of alternative methodologies. The participants were also asked to criticize their methods in terms of the assumptions of the model, the applicability of the model to today's conditions, the policy questions that can most easily be addressed, the time horizon of the model, the treatment of uncertainty, and the phenomena that can be most and least readily described. The first paper deals with the relationship of methods to policy questions. Most of the remaining papers deal with particular methods, including probability theory, network analysis, linear programming, regression analysis, input-output, process analysis, systems dynamics, interactive game theory, and computer simulation techniques. The final presentations, which focus on energy models from a user's point of view, were made by representatives from an oil company and from a public utilities company. ENERGY PROJECTIONS--RELATIONSHIP TO POLICY ISSUES,
Brookhaven National Lab. Upton, N.Y. Energy Systems Analysis Group.
K. C. Hoffman.
In: Proceedings of the Conference on Energy Modeling and Forecasting, Peter Benenson, et al. (Eds.), Lawrence Berkeley Laboratory, University of California, June 1974, p 1-11. 3 ref, 2 fig, 1 tab.

Descriptors: *Energy, *Forecasting, *Projections, Demand, Research and development, Planning, Regulation, Rates, Environment, Standards, Risks.
Identifiers: *Policy issues, Capital investment, Oil allocation.

Accuracy is not the only criterion for evaluating an energy projection. Other attributes of specific forecasts, such as scope, level of aggregation and time horizon should also be considered in light of the policy issue to be addressed. Even a rough approximation of the relative changes attributable to alternative policy actions may be more important than the accurate determination of the demand level. It is not inconsistent for the same groups to use low or high forecasts, depending upon the policy questions they are trying to answer. Because energy policy questions are related to social, economic, political and environmental issues, energy models must be embedded in an overall framework or model that encompasses these issues. One must understand if these differences reflect different economic and social assumptions, different judgements of the influence of the same assumptions, or different degrees of conservatism imposed by the policy issues addressed. This article distinguishes the factors influencing projections in the near, intermediate, and long-term. Four general policy questions have been examined to indicate which attributes are most important. The four policy questions are: research and development planning, capital investment, near-term allocation of oil, and the regulation of rates and environmental standards. A discussion following the article contains such issues as the possibility of combining economic and technical analyses, the level of detail with which one ought to be modeling, and the problem of the self-fullfilling forecast. A PROBABILISTIC MODEL OF THE OIL AND GAS DISCOVERY PROCESS,
Alfred P. Sloan School of Management, Cambridge, Cambridge Mass.
G. M. Kaufman, Y. Balcer, and D. Kruyt.
In Proceedings of the Conference on Energy Modeling and Forecasting, Peter Benenson, et al. (Eds.), Lawrence Berkeley Laboratory, University of California, June 1974, p 13-26. 7 fig.

Descriptors: *Oil, *Probability, *Model studies, *Reservoirs, *Size, Statistical methods, Sampling, Simulation analysis, Monte Carlo methods, Distribution, Rivers, Computers, Graphical methods, Drilling, Economics.
Identifiers: Petroleum gas, Probabilistic models.

Presented is a probabilistic model for the discovery of petroleum deposits. Two assumptions are made regarding the distribution of reservoir sizes and its relationship to the discovery process for reservoirs within a region of uniform geological characteristics, called a 'play': (1) the size distribution within a subpopulation is log-normal; and (2) the probability of discovering a reservoir is proportional to its size. Presented is a statistical analysis of data from plays in Alberta, Canada to support the assumption that the underlying distribution is log-normal. Estimated is the expected sampling distribution of reservoir size in chronological order of discovery. Since the largest reservoirs are most likely to be discovered first the sampling distribution deviates from a log-normal distribution, which leads to an overestimate of the amount of petroleum remaining in place. A Monte-Carlo computer simulation of the discovery process is described. Results show the effect of sample size on the shape of the distribution. Further refinement of the model will be made, and further work will be done to incorporate this physical model into an economic model to investigate the optimum investment strategy for the development of a play over time. Subjects in the discussion following the article include: four methods for estimating the total number of reservoirs in a play; application of the model for predicting cumulative discoveries over time; and a method to incorporate model results into an econometric model for estimating a production function for oil or gas. COUPLED ENERGY SYSTEM-ECONOMIC MODELS,
Brookhaven National Lab., Upton, N.Y. Energy Systems Analysis Group.
K. C. Hoffman, P. F. Palmedo, W. Marcuse, and M. D. Goldberg.
In: Proceedings of the conference on Energy Modeling and Forecasting, Peter Benenson, et al. (Eds.), Lawrence Berkeley Laboratory, University of California, June 1974, p 27-40. 3 fig, 3 tab, 6 ref.

Descriptors: *Energy, *Economics, *Model studies, Systems analysis, Technology, Demand, Supply, Assessment, Fuels, Optimization, Linear programming, Input-output analysis, Environment, Costs, Economic efficiency.
Identifiers: Economic models.

A coupled energy system/economic model is being developed for energy policy analysis and technology assessment. The model emphasizes technological detail of both supply and utilizing devices employed in the energy system, in terms of conversion efficiency, cost, and emissions to the environment. The model consists of the Reference Energy System format and the Brookhaven Energy System Optimization Model. Special features of the model that are important for projecting energy supply and demand are the scope of the model in allowing for interfuel substitution, the incorporation of a load-duration curve for the electrical sector, and the inclusion of the utilizing device as an important element in interfuel substitution. The presentation has dealt in detail with the method for developing the requisite inputs mentioned above, and for operating the model. The model yields the optimal energy flows within the energy demand and resource-supply constraints that are applied for a particular analysis. Also determined is the total annual cost of service and an inventory of emissions to the environment associated with a given energy flow solution. Finally, a study is provided of the range of cost and efficiency ove

ich given technologies are competitive. A
ıpling of the optimization overcomes some of
difficulties in the conventional input-output
roach by providing for technological change
interfuel substitution in the energy sector. A
cussion following this article considers adapting
model to permit the input-output coefficients
change when prices change. (See also W76-
02) (Bell-Cornell)

s, Industries, Input-output analysis, Prices, De-
nd, Estimating, Fuels, Methodology, Evalua-
ı, Taxes, Effects, Equations, Systems analysis,
estment.
ntifiers: Producer behavior, Energy projec-
ıs, Energy policy, Interindustry model, Interin-
try transactions.

dson's approach to analyzing energy develop-
nts and energy-nonenergy economic relation-
ps involves: (1) an interindustry model of U.S.
nomy, incorporating nine intermediate sectors,
h emphasis on the energy-producing sectors;
econometric models of producer behavior for
h of the domestic producing sectors; (3) a
croeconomic growth model; and (4) sub-models
personal consumption expenditures and of in-
tment, government and export components of
l demand. Prices of domestic availability of
put and the input-output coefficients in the
duction of this output are endogenous func-
ıs, simultaneously determined within the
ducer behavior models. Output prices and
duction structure reflect producer adjustment
he prevailing set of prices of the products of all
tors and of capital, labor, and competing im-
ts. The macro-econometric growth model con-
s of endogenous production and household sec-
s and exogenous foreign and government sec-
s. The model integrates demand and supply
ditions or consumption, investment, capital
labor. Dynamic aspects of capital accumula-
ı and consumer behavior are incorporated.
del applications reported include a set of pro-
tions of energy use and its composition, an
lysis of structural changes resulting from an
rgy use tax, and an estimate of the effects of an
rgy tax policy designed to promote energy in-
endence. (See also W76-09602) (Bell-Cornell)

s paper describes preliminary work on a model
stimate the long-run price, cross-price, and in-
ne elasticities of energy sources using
nometric analysis on pooled international data.
recognizing the derived demand nature for
de oil and the numerous possibilities for long-run interfuel substitution, Griffin proposes determining the aggregate final demand for energy in each of eight fuel-using sectors. In a second step, the shares of the respective fuels would be determined. The sample consists of observations for 20 OECD countries drawn at 5 year intervals from 1955-70, giving 80 observations. Discussed are two alternative procedures for estimations of fuel shares. The first is use of ordinary least squares. An alternative approach popularized by Christenson, Jorgenson and Lau is the Translog cost function approach. The advantages and drawbacks of each are discussed. The basic issues are whether the restrictive theoretical conditions of the Translog approach are met statistically and how large the loss in goodness-of-fit will be with the Translog model. Model applications are envisioned to be for long-run forecasting and policy analysis. (See also W76-09602) (Bell-Cornell)

ENERGY SYSTEMS: MODELING AND POLICY PLANNING,
Massachusetts Inst. of Tech. Cambridge. Energy Lab.
M. L. Baughman, and E. Hnyilicza.
In: Proceedings of the Conference on Energy Modeling and Forecasting, Peter Benenson, et al. (Eds.), Lawrence Berkeley Laboratory, University of California, June 1974, p 91-100. 1 tab, 19 ref.

Descriptors: *Energy, *Systems analysis, *Planning, *Model studies, Economics, Methodology, Simulation analysis, Optimization, Fuels, Estimating, Supply, Demand.
Identifiers: *National energy policy, Multidisciplinary, Cost minimization.

This presentation is drawn from two papers. The first is an overview of the major issues pertinent to the formulation of national energy policy, including such issues as the nonrenewability of fossil fuels, imports, national security, and balance of payments. The modeling task and steps are (1) development of conceptual models, (2) identification of data needs, (3) estimation of parameters, (4) assessment of model validity, and (5) testing, prediction, and policy analysis. Alternative ways in which models can be used for policy planning through simulation and optimization techniques are presented. The second paper contains the theoretical framework and results of a descriptive model of energy supply and demand. Demand is broken down into residential, commercial, industrial and transportation sectors. The model is used to establish the consistency of estimates and projections and to maintain a system of accounting. Baughman has used his interfuel substitution study as an example of the model building process described in his modeling and policy planning paper. He gives two examples of how the choice of model depends upon the particular characteristics of a sector and the data availability. The first example is the residential-commercial sector, where fuel choice is a two-step process. The second example is the model for electricity supply, for which he uses engineering estimates. Baughman suggests: (1) linking macro mode models that account for political intervention with micro models that describe fuel supply and demand; and (2) coupling optimization techniques with descriptive models such as the one he has described. (See also W76-09602) (Bell-Cornell)
W76-09608

ENERGY CONSUMPTION AND FUEL CHOICE BY RESIDENTIAL AND COMMERCIAL CONSUMERS IN THE UNITED STATES,
Massachusetts Inst. of Tech., Cambridge. Energy Lab.
M. L. Baughman, and P. L. Joskow.
In: Proceedings of the Conference on Energy Modeling and Forecasting, Peter Benenson, et al. (Eds.), Lawrence Berkeley Laboratory, University of California, June 1974, p 101-119. 4 tab, 3 fig, 15 ref, 2 append.

Descriptors: *Energy, *Model studies, *Simulation analysis, *Decision making, *Fuels, United States, Estimating, Prices, Economics, Electricity, Natural gas, Oil, Equations, Temperature, Systems analysis.
Identifiers: *Energy consumption, Commercial, Residential.

This paper reports the conceptual design and estimation results of models for total demand and aggregate fuel choice decisions in the residential and commercial sector. Fuel utilization decisions can be separated into a two-level decision process. First, the consumer decides on the level of energy using services he desires to meet his functional needs, then he seeks to find the combination of fuels that will provide these services most cheaply. This dichotomy forms the basis for the models adopted. The model used to explain total demand for energy in the residential and commercial sector is a simple flow adjustment model. The long run price and income elasticities of demand in this sector are estimated to be about -0.50 and 1.0 respectively. The short run elasticities were about 16% of these values. Finally, a set of simulations to 1980 are performed using some hypothesized price scenarios. Results show that much conservation can be expected to take place in the residential and commercial sector as a result of price increases and that the geographic shifts in consumption are highly dependent on both the particular fuel in use and the cost of competing fuels in the region. Both these effects should have important significance for policy decisions in the energy area. The paper concludes with a discussion of the modeling and of the potential role of behavioral sciences in the quantitative analysis of supply and demand. (See also W76-09602) (Bell-Cornell)
W76-09609

JOINT USA/JAPAN PROJECT ON GLOBAL SYSTEMS ANALYSIS AND SIMULATION (GLOSAS) OF ENERGY, RESOURCES, AND ENVIRONMENTAL (ERE) SYSTEMS,
Japan GLOSAS Project Committee, Tokyo.
T. Utsumi, and E. A. Eschbach.
In: Proceedings of the Conference on Energy Modeling and Forecasting, Peter Benenson, et al. (Eds.), Lawrence Berkeley Laboratory, University of California, June 1974, p 121-144. 4 fig, 36 ref.

Descriptors: *United States, *Projects, *Simulation analysis, *Energy, *Systems analysis, Effects, Resources, Environment, Computers, Methodology, Networks, Decision making, Research, Design, Supply, Demand, Fuels, Technology, Planning.
Identifiers: *Japan.

Described is a joint United States-Japanese project currently under development for Global Systems Analysis and Simulation (GLOSAS) with special emphasis on the problems of energy, resources and environmental systems. The GLOSAS project is intended to provide decision makers in the participating countries with comprehensive solutions within an international framework. Impacts on domestic economies, international trade and the international monetary system are included. When completed, the project will employ an international computer conferencing network via satellite telecommunications for worldwide interactive simulation modeling. Global simulation would be carried out by running submodels of socio-economic systems on computers throughout the world linked by the communications system. Typical submodels would be for crude petroleum production, world petroleum trade, and domestic economic and energy models. Such diverse modeling techniques as systems dynamics, input/output, linear programming and econometrics would be employed where appropriate. The models will permit input of policy makers' decisions via interactive terminals. Thus an interactive gaming situation for alternative scenarios will exist whereby the results of policy decisions or strategies formulated in different

countries could be exhibited. An objective of the project is to improve cooperation for setting worldwide energy policy. (See also W76-09602) (Bell-Cornell)

THE USE OF ECONOMETRICS TO PROJECT ENERGY DEMANDS,
Data Resources, Inc., Lexington, Mass.
P. K. Verleger, Jr.
In: Proceedings of the Conference on Energy Modeling and Forecasting Peter Benenson, et al. (Eds.), Lawrence Berkeley Laboratory, University of California, June 1974, p 145-157. 17 ref.

Descriptors: *Energy, *Demand, *Mathematical models, Prices, Forecasting, Economics, Fuels, Transportation, Industries, Equations, Systems analysis, *Projections.
Identifiers: *Econometrics, Disaggregation.

Presented is a critique of econometric techniques for projecting energy demands, and the usefulness of these techniques for analyzing policy is discussed. The pairing of modeling techniques with specific problems is necessary if projections made by econometric techniques are to be accurate. During the last five years most of the econometric projections have been at a very aggregated level and price impacts have been systematically excluded. A subset of these studies is mentioned having the following characteristics: (1) a specific sector and fuel is examined; (2) the model is regionally disaggregated; (3) price is included as an explanatory variable; and (4) attention is paid to the theoretical structure of demand. A model with these characteristics may, given proper projections of exogenous data, function as a good forecasting tool. An important difference between the two model types is that the disaggregated model attempts to distinguish between the energy usage pattern and the capital stock of energy-using devices. The stock-flow separation is discussed in detail and a model is sketched that incorporates this distinction. This model allows for extramarket constraints on the choice of fuel, such as the unavailability of fuel in a particular region. Such a model can be used under the situations prevailing today. Price effects and regulatory constraints can be included. Several drawbacks of this model are also discussed. The problem of data disaggregation by fuel, industry, and region is explored. Following the paper is a discussion, including applications of econometric models. (See also W76-09602) (Bell-Cornell)

ENERGY MODELS AND FORECASTS: A USER'S POINT OF VIEW,
Exxon Corp., New York. Corporate Planning Dept.
P. P. McCall.
In: Proceedings of the conference on Energy Modeling and Forecasting, Peter Benenson, et al. (Eds.), Lawrence Berkeley Laboratory, University of California, June 1974, p 159-165. 1 fig.

Descriptors: *Energy, *Demand, *Forecasting, *Mathematical models, Linear programming, Oil, Industries, Supply, Technology, Fuels, Economics, Systems analysis.
Identifiers: Disaggregation, Fuel substitution, Functional demand.

During the past twenty years, Exxon has employed the forecasting methods of judgment and trend extrapolation. Energy demand forecasts for the individual units of the company were accurate, but forecasts for the total industry were low. Exxon's projections of the world energy supply indicated a flattening out of world oil production in the late 1980's or early 1990's, alerting them to the energy crisis. Currently Exxon uses a linear program for the world oil industry. It is highly disaggregated by geographical region, refining technology, transportation technology, and type of oil. It is used to forecast future oil prices and to provide a framework for facilities planning. The important components of an ideal energy model were outlined. Functional demand should be considered first in an energy model. Price, alternative supply technologies, fuel substitution, and the natural resource base also should be considered. Further, here is a need for disaggregation to incorporate these considerations and to monitor changes in trends. No all-purpose model is expected. The Brookhaven model is useful because it deals with functional demand, alternative supply technologies, and interfuel substitution. Its hierarchical structure renders it useful to policy makers. Following the paper is a discussion of the Exxon linear programming model. (See also W76-09602) (Bell-Cornell)

ENERGY MODELS AND FORECASTS: A USER'S POINT OF VIEW,
Pacific Gas and Electric Co., San Francisco, Calif.
R. L. Breen.
In: Proceedings of the Conference on Energy Modeling and Forecasting, Peter Benenson, et al. (Eds.), Lawrence Berkeley Laboratory, University of California, June 1974, p 167-170.

Descriptors: *Energy, *Forecasting, *Demand, *Mathematical models, Economics, Decision making, Costs, Systems analysis.
Identifiers: *Econometrics, Disaggregation, Credibility.

Econometrics can be used to complement modeling techniques such as input-output and process analysis to model the total energy system. Once this has been accomplished, high priority should then be attached to sectoral and regional disaggregation. This step is needed because policy decisions impact differently on different industries and geographical regions. A user's evaluation of a model takes into account (1) the policy question to be answered, (2) the level at which the decision will be made, and (3) the cost of the model. Concerning the first point, the policy issues must be clearly stated before the usefulness of a model can be determined. For example, a utility which must consider the issues of rate structure design, facilities planning, siting, and environmental impacts needs a regional model. Such models should be linked with more comprehensive national models, but the methods for doing this are not well developed. A particular problem is whether price determination takes place in the regional or the national model. Furthermore, once it is determined, by what method can it be incorporated in the model to which it is linked. A user of models also takes into account that decisions are made at several very dissimilar levels (national, regional and corporate); no single model can answer questions at all these levels. Finally, the model builder must be able to justify the costs of the model to the potential user. Models should be applied only to the uses for which they were intended. Discussed is the linkage problem. (See also W76-09602) (Bell-Cornell)

THE COST ASSIGNMENT OF THE COOPERATIVE WATER RESOURCE DEVELOPMENT: A GAME THEORETICAL APPROACH,
Tokyo Inst. of Tech. (Japan).
M. Suzuki, and M. Nakayama.
Management Science, Vol. 22, No. 10, p 1081-1086, June 1976. 4 tab, 7 ref.

Descriptors: *Water resources development, *Cost allocation, Linear programming, Rivers, Water supply, Agriculture, Optimization, Mathematical models, Systems analysis.
Identifiers: Cooperation, Game-theoretic approach, Japan.

As the demand for natural resources intensifies, the costs of further exploitation of these resources become enormous. These costs, in turn, require the development of a given resource to be a cooperative venture among several participants, each of whom must be assured that the costs and benefits of the venture will be 'fairly' distributed among them. It is at this point that the theory of cooperative games may offer guidelines as to what is fair or not fair to each participant or player in a given cost allocation. To illustrate an application of cooperative game theory in assigning 'fair' costs and benefits to the participants in a cooperative venture, an example problem in water resources is considered. A mathematical model of water resource development is applied to the case of Kanagawa prefecture in Japan, for which it is assumed that a dam will be constructed on the River Sakawa and that the diversion of water from agricultural use to city service is done in the basins of the Rivers Sakawa and Sagami. THE COST-EFFECTIVENESS OF WATER RESOURCES SYSTEMS CONSIDERING INADEQUATE HYDROLOGICAL DATA,
Technion - Israel Inst. of Tech., Haifa. Lowdermilk Faculty of Agricultural Engineering.
N. Buras.
In: Design of Water Resources Projects with Inadequate Data, Vol. 2, Proceedings of the Madrid Symposium, June 1973; Unesco - WMO - IAHS - Unesco - OMM - AISH, 1974, p 649-659. 2 fig, tab, 9 ref.

Descriptors: *Water resources, *Hydrologic data, Projects, Design, Costs, Effects, Planning, Reservoirs, Water demand, Groundwater development, Probability, Equations, Decision making, Management, Mathematical models, Systems analysis.
Identifiers: *Cost effectiveness, *Inadequate data, Reservoir capacity.

How much hydrological information is necessary for the design of water-sources systems is not yet satisfactorily known. In general, the cost of a project decreases with the amount of available hydrological data. However, additional hydrological data involve increased cost, interms of more gauging stations and more costs incurred to society by delaying the design for data collection and processing. These two cost functions can be shown as two curves intersecting in the data-cost space; the parabola is the sum of the two functions. Adequate hydrological data is defined as the amount of information corresponding to the minimum ordinate of the total cost curve. Information in excess of this amount is as inadequate as not enough data, and may increase the project

t. Insufficient data is used for information less
n adequate, and redundant data for information
xcess. Considered are the consequences of in-
quate hydrological data on the cost and effec-
eness of water resources structures and pro-
ts. Discussed is cost-effectiveness, flexibility in
nning, reversible vs. irreversible decisions. For
nning and design with inadequate data, two ex-
ple problems are considered: (1) determining
capacity of a surface reservoirto satisfy a
en demand; and (2) evolving a planning and
nagement model of a groundwater development
ject. (Bell-Cornell)

Harvard Univ., Boston, Mass. Graduate School of Business Administration.
G. C. Rausser, and C. E. Willis.
Water Resources Research, Vol. 12, No. 3, p 317-330, June 1976. 2 fig, 5 tab, 35 ref.

Descriptors: Water resources, *Design, *Investment, *Water allocation(Policy), Technology, Desalination, Costs, Decision making, Constraints, *California, Computers, Water supply, Water demand, Regional analysis, Estimation, Optimization, Equations, Mathematical models, Systems analysis, Water quality, *Cost allocation.
Identifiers: Quadratic programming, Integer programming, Sequencing, Cost minimization.

Four of the more important unresolved problems in the design of water resources systems involve a determination of methods to deal with technological progress (e.g., new desalting processes), availability of water from more than a single supply source, the rate of investment in the capital complex employed to exploit the resource along with the allocation of water once the capital complex is in place, and price sensitive demands for water. The importance of these issues is demonstrated, and a decision framework is advanced which formally incorporates each along with a new technique for solving large-scale investment-sequencing and water allocation problems. The allocation process is formulated as a quadratic programming problem, and the investment-sequencing process is specified as an integer programming problem. Four theorems are advanced which outline the consistency and convergence properties of this iterative approach. The framework is applied to an empirical situation in California with encouraging results. (Bell-Cornell)

METAGAME THEORY AND ITS APPLICATIONS TO WATER RESOURCES,
Waterloo University (Ontario). Dept. of Civil Engineering.
K. W. Hipel, R. K. Ragade, and T. E. Unny.
Water Resources Research, Vol. 12, No. 3, p 331-339, June 1976. 14 fig, 4 ref.

Descriptors: *Water resources, *Operations research, *Political aspects, Water pollution control, Management, Behavior, Equations, Feasibility, Decision making, Systems analysis.
Identifiers: *Metagame theory.

Metagame theory is a new scientific method that reconstructs classical game theory on a nonquantitative basis in order to analyze political conflicts. It is a positive descriptive approach that can be used for the political resolution of water resource conflicts. Quantitative methods of operations research may be integrated with the political analysis so as to arrive at solutions to water resource problems that are politically feasible as well as economically and technically feasible. Herein, various resource problems are formulated, and it is shown by two examples that classical game theory, which is based on the theory of rationality, does not work. The concepts of metagame theory are surveyed within a nonquantitative set theoretic framework. The conflicts examined illustrate the potential of metagame theory for analyzing water resource management problems. (Bell-Cornell)

SPECIFICATIONS FOR CONTAINER FACILITIES BY SIMULATION,
O. Beeman, and G. Vallicelli.
In: Symposium On Modeling Techniques, Volume I: 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 23-42, 1975.

Descriptors: *Model studies, *Harbors, *Facilities, *Docks, Ships, Mathematical models, Simulation analysis, Operation and maintenance, Equipment, *Oregon.
Identifiers: *Container facilities, Shipping, Port facilities, Portland(Ore).

The cost of container facilities is now approaching $15,000,000 per berth. Concurrently, standby costs of a modern container vessel can exceed $20,000 per day. The high costs and high risks involved demand that rule of thumb planning be replaced by modern planning techniques, including simulation of the system to optimize its design and to assure that it is brought on-line at a proper time. The techniques described were originally devised to set performance specifications for a new container facility at the Port of Portland, Oregon. These techniques were used to analyze the following criteria and parameters: (1) required berth length, (2) queuing and servicing times per vessel, (3) berth utilization, (4) crane utilization, (5) yard equipment utilization, (6) type of equipment, (7) number of cranes and other container handling equipment, (8) general yard layout, (9) design of entry gate, and (10) number of shifts worked per day. In each case, the simulation was used to test the impact of changing berth scheduling, ship size, load per vessel, berth length, crane productivity, etc. Rather than using a single simulation for all problems, emphasis was placed on having the appropriate simulation for each given problem, and to tackle the problems at the lowest possible level. A large scale microsimulation was used in order to check the effect of all decisions on the entire system. (See also W76-09941) (Sims - ISWS)

HYDROELECTRIC POWER POTENTIAL AT CORPS OF ENGINEERS PROJECTS. RECOMMENDATIONS AND EXECUTIVE SUMMARY,
Institute for Water Resources (Army), Fort Belvoir, Va.
R. L. Trisko.
IWR Research Report 75-R2, May 1975. 42 p.

Descriptors: *Energy, *Electric power production, *Hydroelectric plants, *Feasibility studies, Project feasibility, Pumped storage, Competing uses, Peaking capacity, Water resources, Limiting factors, Water supply, Fossil fuels, Environmental effects, Electric power rates, Electric power costs, Evaluation, Interest rates, Discount rates, Projections, Cost-benefit ratio, Federal project policy.
Identifiers: *Corps of Engineers projects, *Hydro/energy potential.

This summarization of the comprehensive report of the same title is prefaced by recommendations for the Corps of Engineers to study new projects previously considered unfeasible, of power potential at existing projects without power, and additions to existing projects with power. The Corps should re-examine operating rules at reservoirs with power installations in view of increased power values relative to other benefits, and the possibilities of enhancing or increasing power generation and capacity. The federal role in the development of pumped storage should be defined so that the economic, social, and environmental problems associated with the need for additional peaking power can be thoroughly analyzed and federal hydropower development and operation should emphasize increased sources of peaking power. The federal policy relating to the marketing of its hydropower should reflect present economic development, energy supplies, and costs and should permit market prices based on revised rate structures consistent with value. A single benefit-cost ratio should be deemphasized and project planning should stress maximum displacement of scarce fuels. Water resource development should be based on comprehensive assessments of long range water needs on regional and national bases, including requirements of thermal energy production and processing industries, as well as hydropower generation. Descriptors: *Energy, *Electric power production, *Hydroelectric plants, *Feasibility studies, Projections, Project feasibility, Reservoir operation, Federal project policy, Pumped storage, Peaking capacity, Pricing, Power marketing, Water resources, Project planning, Efficiencies, Economic feasibility, Evaluation, Model studies, Fuels, Electric power industry, Electric power costs.
Identifiers: *Corps of Engineers projects, *Hydro/energy potential.

An overview of hydropower potential in the context of energy and water resources and demands, energy economics, and federal policy, organization, and practices pertaining to hydropower development and marketing presents a framework within which the Corps of Engineers might conduct studies at existing projects and on streams susceptible of development by the Corps. The discussion focuses on energy resources, consumption, regional hydropower distribution, load curve, economic, and environmental perspectives; and potential displacement of fossil fuels through increased hydropower development is related to the selection of thermal alternatives, environmental and balance of payment implications, and pumped storage. The economics of hydroelectric power are evaluated as they relate to its complexities, standards based on interest rates, determination of power values, use of levelized costs, cost allocation, and electrical cost characteristics and trends. Appendices contain samples of hydropower values assigned by Federal Power Commission regional offices, long run fossil fuel thermal power generating real costs and economics. A computerized cost model for evaluating capacity is supplemented by examples of calculation results. The survey of federal hydropower marketing and rate making practices includes various rate schedules and a financial data summary. Federal power marketing practices detail overall power marketing and by agency. (See also W76-09764) (Auen-Wisconsin)

Descriptors: *Oil industry, *Fossil fuels, *Resources development, *Economic impact, *Economic justification, Continental Shelf, New England, Massachusetts, Oil fields, Coasts, Models, Regional economics, Industries.
Identifiers: *Outer Continental Shelf, *Refineries, North Atlantic Ocean, Georges Bank.

Georges Bank, an historically prolific fishing ground off the coast of New England, is one of three areas along the Atlantic OCS of particular interest in terms of potential oil and gas reserves and production. A representation of the hypothetical development of individual Georges Bank oil and gas fields was constructed. Its results were used to make judgments about some of the implications of a buildup of a potential Georges Bank petroleum basin, i.e., a number of fields. A multi-industry multiregional economic model was adapted to provide insights into the kinds of direct and indirect effects alternative offshore oil and gas and petroleum refinery developments could have on the region. Hypothetical production from a Georges Bank petroleum province is projected for consideration. The potential offshore petroleum and refinery investment is seen in two parts: direct investment demands associated with potential offshore petroleum development and potential refinery activity within New England. The regional economic consequences of the developments are projected and tabulated. The impacts on a coastal area, Bristol County, Massachusetts are used to illustrate the projections for a particular geographic unit. (Sinha-OEIS)

dentifiers: *Water authority, Rate making, Private water firms, Water consumer, Level of ilization, Customer mix, Technological costs.

he performance of unregulated municipal water uthorities and regulated private water firms is ompared. Four study groups were selected. uthorities and private firms using 80 percent of pply from surface water formed groups one and vo. The same type firms using 80 percent ground-ater composed groups three and four. Cost com-risons between groups one and two showed that technological costs are lower for private firms than for municipal authorities, but that when the institutional differences of tax and interest are taken into account, private firms' costs are higher than those of the municipal authority. Factors consistently influencing cost significantly are customer mix, level of utilization, and output. Between 35 and 50 percent of variation in cost was explained by these variables. The analysis of well water firms -- both private and municipal authority -- was much less conclusive. Private firms have higher cost levels than municipal authorities over much of the relevant range of output. When the revenue and cost functions of the firms studied were examined it was concluded that rate of return regulation of municipal authorities would not be beneficial to the consumer. ARIZONA ENERGY: A FRAMEWORK FOR DECISION.
Arizona Univ., Tucson.
Arizona Academy, Phoenix, 28th Arizona Town Hall Research Report, April, 1976. 154 p, 34 tab, 24 fig, 69 ref. $5.00.

Descriptors: *Electric power production, *Arizona, *Energy conversion, *Water management(Applied), *Water utilization, *Water allocation(Policy), Energy, Hydroelectric power, Tidal energy, Thermodynamics, Planning, Thermal pollution, Air pollution, Water quality standards, Nuclear powerplants, Water cooling, Fossil fuels, Coals, Conservation, Geothermal studies, Water reuse, Waste water disposal, Colorado River.
Identifiers: *Biological energy sources, *Solar energy.

Technical and planning-related information on Arizona's energy needs and resources are presented, with some specific attention to the potentials of hydropower and to water use for extraction and conversion of energy minerals and for cooling in thermal power generation. Material is presented on the state's energy economy including discussion of supply sources and consumption patterns, technical explanations of energy conversion and use, potential energy sources and their availability, and decision-making issues and prospects. Although coal is abundant, large quantities of water are needed to process it, as well as for gasification. Hydropower cannot compete in output with the coal-fired Navajo Generating Station at Page, Arizona, because of a lack of enough suitably placed river water. Pumped storage for secondary hydroelectric generation is an economical way of providing required peaking power. Water needs for processing and cooling are outlined; the Navajo station, for instance, uses 13.5 acre-feet of water per year for each megawatt produced. Sources include surface, ground and waste water; groundwater is most versatile and abundant, but overdraft is becoming widespread and supplies are limited. Waste water discharge and reuse potentials are also described. Legal questions concerning Colorado River water use and thermal pollution problems are discussed. (Jahns-Arizona)

POWER GENERATION IN ARIZONA AND ITS ENVIRONMENTAL IMPLICATIONS,
Arizona Univ., Tucson. College of Engineering, Engineering Experiment Station.
S. E. Smith.
EES Series (1976) Report No. 47. 215 p, 46 fig, 41 tab, 101 ref, 4 append.

Descriptors: *Electric power production, *Hydroelectric plants, *Nuclear powerplants, *Arizona, *Thermal powerplants, *Water demand, Industrial water, Powerplants, Electric power costs, Colorado River, Coals, Turbines, Environmental effects, Economic efficiency, Water consumption(Except consumptive use), Fuels, Electric power, Effluents, Radioactive waste, Water pollution.
Identifiers: Gas turbines.

Information is presented on hydroelectric, coal-fired, gas turbine and nuclear power generation with analyses of their respective natural resource demands and impacts in Arizona. Comparisons are made between different types of power plants as to the amount of land and water needed to sustain that generation process. Most power plants require substantial amounts of water to cool condensers; tables are provided showing the water use pattern of different plant designs and input-use balance data for the state. The percentage contribution of hydropower to Western electrical needs has decreased steadily since 1950; as the number of conventional thermal power plants has increased, hydroelectric power has assumed less of a base load and more of a peak load service role. Coal is most abundant, but its extraction causes more serious ecological damage. The advantages and disadvantages of these power generation systems are described with respect to economic and environmental impacts, including water use and pollution. (Jahns-Arizona)

PROBLEMS AND SOLUTIONS IN ESTIMATING THE DEMAND FOR AND VALUE OF RURAL OUTDOOR RECREATION,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
R. L. Gum, and W. E. Martin.
American Journal of Agricultural Economics, Vol. 57, No. 6, p 558-566, November 1975. 4 tab, 13 ref.

Descriptors: *Recreation demand, *Estimating, *Rural areas, *Regional analysis, Mathematical models, Resource allocation, Value, Methodology, Evaluating, Arizona, Fishing, Hunting, Costs, Regression analysis, Equations, Systems analysis.

An improved methodology for estimating demand functions for outdoor recreation and evaluating the outdoor recreation resource by use classification is presented. The illustrative framework is a large-scale empirical study of all outdoor recreation activities in all areas of Arizona. The first step of the analysis is to estimate statistical demand relationships for the recreation experience as a whole. Demand relationships were derived for: (a) deer hunting; (b) other big game hunting; (c) small game hunting; (d) waterfowl hunting; (e) predator hunting; (f) cold water fishing; (g) warm water fishing; and (h) general rural outdoor recreation for each of the seven Arizona Department of Fish and Game regions in the state where more than twenty-five area-activity observations were obtained. The use of the improved procedures produces estimates of resource values which are much larger than in most previous studies and which are about the size of estimates of gross variable expenditures. It is argued that the time has come to relax the search for improved estimating methodology and concentrate on interpretation of the estimates in studies of resource allocations. (Bell-Cornell)

AN ECONOMIST'S VIEW OF THE OCEANS,
Yale Univ. New Haven, Conn.
R. N. Cooper.
In: Perspectives on Ocean Policy, Conference on Conflict and Order in Ocean Relations, October 21-24, 1974, Airlie, Virginia, p 143-165. 3 fig, 8 ref, append. (Prepared for NSF by Johns Hopkins University, Washington, D. C.)

Descriptors: *Oceans, *Management, *Economic efficiency, *Fisheries, Benefits, Optimization, Water pollution, Mathematical models, Equations, Systems analysis.
Identifiers: Scarcity rent, Maximum sustainable yield, Shipping, Seabed minerals, National security.

Taken is a global perspective in analyzing how better ocean management can maximize benefits to the world at large. The oceans are no longer a free common resource, but have taken on economic value commanding scarcity rent. Efficient use of the oceans requires limiting access to those willing to pay this rent; suggested are principles for collecting the rent. Ocean fisheries are analyzed in detail. It is found necessary that the rent be prevented from influencing entry and investment in the industry; a charge could be levied on all those engaged in the fishing industry. Such an arrangement would increase efficiency and would generate substantial revenues that could be used for developmental purposes and other interests of the international community. For optimal management of fisheries along these lines,

hstocks need be generally kept larger than is ggested by the principle of maximum sustaina- yield. While methods of maximizing the gains m ocean's resources need not be a source of nflict, the distribution of the gains is a potential urce of disagreement, and they should be used inly to serve global objectives, such as nomic growth of developing countries. velopment of accurate scientific and economic ormation is imperative for an efficient manage- nt system. Appended to this article is a simple thematical model of a fishery and a guide to op- um management. (Bell-Cornell)

PA AND A STATE'S ROLE IN WATER SOURCES MANAGEMENT,
w York State Dept. of Environmental Conser- tion, Albany.
P. Curran, and T. W. King, Jr.
ter Resources Bulletin, Vol. 10, No. 1, p 127- 5, February 1974.

scriptors: *Water resources, *Management, nvironment, New York, Legislation, Projects, deral government, Decision making.
ntifiers: *Environmental impact, *National En- onmental Policy Act.

e National Environmental Policy Act of 1969 s been called a revolutionary piece of legisla- n. It has changed, and is still changing, the tradi- nal ways of governmental decision-making. EPA has strongly influenced the field of water sources management. An environmental state- nt can now be seen not as a document to sup- rt or justify a plan, but an objective assessment what environmental costs and benefits are in- lved. New York State has seized upon NEPA as important feature of its environmental quality nagement programs and has used the opportu- y to comment upon draft environmental state- nts under NEPA to increase its influences upon deral decision making. The Department of En- onmental Conservation coordinates and nthesizes all comments and provides one unified ate response on a statement. At the State level, cking a comprehensive 'little NEPA,' an exten- e environmental analysis program has been ilt by utilizing a wide spectrum of Federal and ate Laws and administrative regulations. F. Nonstructural Alternatives

FLOODPLAIN MANAGEMENT RAMEWORK WITH STRUCTURAL AND ON-STRUCTURAL MEASURES,
assachusetts Univ., Amherst. Water Resources search Center.
L. Kaul, C. E. Willis, and J. H. Foster.
Available from the National Technical Information Service, Springfield Va., 22161, as PB-254 544, $5.50 in paper copy, $2.25 in microfiche. Publication No. 61, Completion Report FY-76-8, October 1975. 114 p, 3 fig, 27 tab, 209 ref, 5 append. OWRT B-043-MASS(5) 14-31-0001-5081.

Descriptors: Management, *Connecticut, *Nonstructural alternatives, Cost analysis, Cos-benefit analysis, Warning systems, *Flood protection, Flood plain insurance, Decision making, *Flood plain zoning.
Identifiers: Farmington(Conn).

A decision framework is developed which describes the results of an investigation of the economic potential of structural as well as nonstructural measures for a floodplain in Farmington, Connecticut. The analysis demonstrates the potential usefulness of operations research methods to flood zone decision makers. A review of the literature is included. Components of the decision framework are developed, regional application is attempted, the distributional equity impacts of the alternative measures are discussed. It is clearly feasible to develop an operations research framework, featuring the floodplain management alternatives considered here, which: treats rent or land values as a function of level of development; is capable of considering interrelationships among uses; is capable of formally reflecting planners' aversion to uncertainty; and which provides for early period decisions which are conditional upon forecast later period situations.

LANDSLIDE HAZARD IN THE UNITED STATES: A RESEARCH ASSESSMENT,
Colorado Univ., Boulder. Inst., of Behavioral Science.
J. H. Sorensen, N. J. Ericksen, and D. S. Mileti.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-242 979, $5.00 in paper copy, $2.25 in microfiche. Report No. NSF-RA-E-016, June 1975. 90 p. 9 fig., 11 tab., 48 ref. NSF GI 32942.

Descriptors: *Landslides, *Research priorities, *Hazards, *Costs, Land use, Damages, Social impact, Protection, Warning systems, Land management, Rehabilitation, United States, California, Colorado, Forecasting, Insurance, Probability, Regulation.
Identifiers: Research needs, Case studies, San Jose(Calif), San Francisco(Calif), Los Angeles(Calif).

Research requirements for landslide hazards are proposed relating to both the reciprocal actions to landslides by protection, prediction, land use management, disaster preparedness, relied and rehabilitation, and insurance (by increasing the limits of coverage for the National Flood Insurance Program) together with constraints mitigating against the effectiveness of the reciprocal actions. A description of each research need is presented, then a framework for examining those proposals is suggested. Levels of expenditures believed to be required for the successful outcome of the research are provided. The needs for research are substantiated by discussions of the nature of landslides and their regional distribution. Human adjustment to landslides is defined by classifying adjustments, the nature, responsibility, effectiveness, and cost of such actions and constraints on their adoption, adjustment trends, and interaction and combination of adjustments. The national cost of landslides is defined, citing two case studies in California, and the catastrophe potential, and cost distribution. Exogenous forces affecting landslides are cited as population growth, environmental concerns, and the public energy policy with its impact on landslide potential. (Auen-Wisconsin)
W76-09781

A LINEAR PROGRAMMING MODEL FOR USE IN GUIDING URBAN FLOODPLAIN MANAGEMENT,
Arizona Univ., Tucson. Dept. of Agricultural Economics.
J. C. Day, and R. N. Weisz.
Water Resources Research, Vol. 12, No. 3, p 349-359, June 1976. 1 fig, 6 tab, 42 ref, 2 append.

Descriptors: *Flood plains, *Management, *Linear programming, *Flood control, Optimization, Engineering, Economic efficiency, Land use, Constraints, Alternative planning, Operations research, Mathematical models, Equations.
Identifiers: *Urban planning, Land use allocation, Site elevation, Time variables, Maximization model, Regression equations.

Modern planning seeks better solutions to urban flood problems through floodplain management practices involving coordinated land use and engineering approaches. Land use control can be integrated with dams, levees, channel works, etc., but the physical and economic interrelationships must be taken into account. Trade-offs require quantification of the economic impacts of dissimilar alternatives. Herein, a linear programming land use assignment model is combined with discrete sets of public land acquisition and engineering works. Solution of the management system yields an economically desirable mix of measures which can be constrained by noneconomic conditions. Empirical testing of the approach and sensitivity analysis verify that useful planning guidelines for large and small urban areas alike can be produced. The computational technique presented herein is applied to the Tucson situation to determine the optimum combination of flood control works and land development policies; information helpful for floodplain management is yielded. THE SAHELIAN DROUGHT AND ITS DEMOGRAPHIC IMPLICATIONS,
Australian National University, Canberra, Department of Demography.
J. C. Caldwell.
American Council on Education, Overseas Liason Committee, Paper No. 8, December, 1975. 88 p, 4 tab, 1 fig, 103 ref.

Descriptors: *Droughts, *Human population, *Africa, *Arid lands, *Environmental effects, Grasslands, Mortality, Crop production, Land use, Livestock, Weather patterns, Weather data, Water resources development, Planning, Migration.
Identifiers: *Sahel, Nomads.

The Sahelian drought region and its demography are analyzed with specific attention to fertility control, effects on population and mortality rates, savannah imbalance, nomadic-sedentary relationships and general reactions of the population to the drought condition. Sahelian population will increase by about 17 million in the next 25 years. Growth rates among nomads could force sedentarization of considerable numbers of these people. Possible weather changes and past trends are described, along with the effect on herds, crop production and pasturage. Large-scale irrigation appears limited in usefulness and too costly. The region had received two seasons of satisfactory rainfall by the end of 1975, and emergency relief

had mostly been replaced by 'medium-term development' and 'long-term assistance' programs aimed at increasing food production and improving the savannah's position as a provider of livestock meat for coastal countries. (Jahns-Arizona)

AN ASSESSMENT OF ESTUARINE AND NEARSHORE MARINE ENVIRONMENTS,
Virginia Inst. of Marine Science, Gloucester Point.
Report No. FWS/OBS-76/05, March 1976. 132 p, 3 fig, 34 tab, 209 ref. Editors: Lynch, M. P., Laird, B. L., Theberge, N. B., and Jones, J. C.

Descriptors: *Estuarine environment, *Water demand, *Estuarine fisheries, Recreation demand, Water management(Applied), Commercial fishing, Marine animals, Income analysis, Evaluation, Environmental effects, Regional analysis, Wildlife management.
Identifiers: National Water Resources Assessment.

The impacts of water uses and projected water demands upon the estuarine and nearshore marine environments of the United States have been evaluated as part of the 1975 National Water Resources Assessment. The evaluation included a regional review of major estuarine nearshore marine habitats, major problems impacting water and water resources, the management approach of the states, and Federal management initiatives, particularly Federal-State interactions. Geological history, tidal amplitude, weather, currents, latitude, and estuarine environments are described for each region. Estuarine resource harvest and projections are given for commercial fisheries, sport fishing, waterfowl, other wildlife harvest, bird watching, and recreational boating. Conflict areas include domestic versus foreign fleets, commercial versus sport fishing, subsistence versus commercial harvest activities. Future harvest and recreational projections include demand/supply of fisheries products, and recreation and hunting demands. Impacts of predicted water resource utilization include demand/supply, patterns of water use, seasonal and annual freshwater outflows, and effects of increased comsumptive use. Appendixes include a partial list of estuarine dependent and nearshore marine species, a list of species under each waterfowl harvest category, projected changes in population for water resource regions, projected per capita income for water resource regions, and present status of selected species of interest to U. S. fishermen. (Fish and Wildlife Service)

METHODOLOGIES FOR THE DETERMINATION OF STREAM RESOURCE FLOW REQUIREMENTS: AN ASSESSMENT,
Utah State Univ., Logan. Dept. of Wildlife Science.
C. B. Stalnaker, and J. L. Arnette.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-253 152, $7.75 in paper copy, $2.25 in microfiche. U.S. Fish and Wildlife Service, Office of Biological Services, Report No. FWS/OBS-76/03, 1976, 199p.

Descriptors: Water quality, Measurement, Environmental effects, Water resources, Flow, Flow control, Flow measurement, Wildlife, Aquatic biology, Fish, Mathematical models, Recreation facilities, Aesthetics, Reviews, Research priorities, Methodology, Model studies, Evaluation.

Techniques for establishing instream flow requirements and assessing the effects of changing stream flows, are summarized and evaluated. The state-of-the-art summation is intended to provide a basis for further work in developing methodologies and defining research needs. Standard nomenclature is presented. Basic stream flow measurements and relationships are described and methodologies for evaluating water quality in streams and estuaries in relation to flow changes are examined. Methods for assessing instream flow needs for fish, other aquatic life, and terrestrial wildlife are discussed. Problems of determining the impact of stream flow changes on recreational activities and aesthetic values are considered. (Fish and Wildlife Service)

THE CONTRIBUTION OF A WATER INFORMATION SYSTEM FOR ENVIRONMENTAL PLANNING IN MINNESOTA,
Minnesota Univ., Minneapolis. Dept. of Geography.
B. R. Higgins.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-254 626, $5.00 in paper copy, $2.25 in microfiche. Water Resources Research Center Bulletin 86, University of Minnesota. March 1976. 70 p, 19 fig, 3 tab. OWRT A-031-MINN(2).

Descriptors: *Minnesota, *Planning, *Environment, *Attitudes, Data collections, Information exchange, Social values, Social change, Watershed management, Land use, Water quality, Lakes, Fish.
Identifiers: *Information systems, *Environmental planning, Information dissemination, Housing, *Swan River Watershed(Minn).

A conceptual design of a computerized statewide water information system is devised in order to use existing land and water data together for environmental planning decisions. In order to specifically demonstrate the potential of such a system, a case study area was chosen, the Swan River Watershed in southeastern Itasca County, and the rudiments of a water information system were constructed. Research being conducted by the Center for Urban and Regional Affairs of the University of Minnesota and the State Planning Agency has produced a computerized land management data base for the Arrowhead planning region which includes Itasca County, Minnesota. In this system there are already some variables which are considered water information variables. These include: flood potential for urban residential land use; drainage class of soil landscape unit; wetness problem for urban residential construction; septic tank limitations for urban residential construction; groundwater contamination potential for urban residential construction; land use; and water orientation. By including other water variables which were available, a more complete environmental planning methodology may be constructed and environmental policy modified. The following water variables were computer coded for each forty acre parcel in the Swan River Watershed: watershed boundaries; Minnesota Pollution Control Agency water quality classification; Minnesota Department of Natural Resources; water appropriation permits; Minnesota Pollution Control Agency point source discharge; Lakeshore Study lakeshore physical combinations; lake fish type; lake crowding potential; and lake relative water crowding. To demonstrate, clarify, and elaborate a possible planning approach, the topic of housing was discussed in terms of water and environmental planning.

ENVIRONMENTAL IMPACT STUDY OF OFFSHORE SAND AND GRAVEL MINING,
National Oceanic and Atmospheric Administration, Tiburon, Calif. Marine Minerals Technology Center.
H. D. Hess.
Marine Technology Society Journal, Vol 7, No 1, p 49-52, January-February 1973. 5 fig.

Descriptors: *Mining, *Dredging, *Environmental effects, Model studies, Continental Shelf, New England, Sands, Gravels, Monitoring, Massachusetts, Planning.
Identifiers: *Outer Continental Shelf, *Environmental impact, *Offshore technology, United Kingdom, Massachusetts Bay, New England Offshore Mining Environmental Study(NOMES).

The New England Offshore Mining Environmental Study (NOMES) is a four-year, NOAA-sponsored, cooperative federal/state experiment designed to assess the environmental impact of offshore sand and gravel mining. The project will include monitoring a short duration dredging operation in Massachusetts Bay and determining by field tests and laboratory studies the nature, magnitude, and impact of resultant environmental disturbances. Prediction techniques, developed through complementary laboratory testing and modeling, will enable planners and decision-makers to estimate the general nature of the environmental impact. Through the data generated and environmental guidelines developed, Project NOMES will provide a scientific basis for establishing realistic environmental safeguards over any future offshore mining operations of this type. The experiment obviously will not provide immediate answers to all of the questions concerning the effects of marine sand and gravel mining on the environment in all potentially promising offshore areas. However, it will provide the beginnings of an understanding of the broad cause-

and-effect relationships involved and assist decision making through sounder judgments based on predictive models. (Sinha - OEIS)

ACADEMIC DATA-NEEDS FOR ENVIRONMENTAL ASSESSMENTS OF OFFSHORE TECHNOLOGICAL OPERATIONS,
New York Ocean Science Lab., Montauk.
R. Nuzzi.
Marine Technology Society Journal, Vol 9, No 5, p 25-28, July 1975. 7 ref.

Descriptors: *Baseline studies, *Environmental effects, Resources development, *Water quality control, Ecosystems, Monitoring, Continental Shelf.
Identifiers: *Outer Continental Shelf, *Offshore technology, Environmental impact.

Questions currently being asked cannot be answered concerning environmental impact because technology, as generally thought of in the phrase 'offshore technology,' is years ahead of science. While we have the technical ability to build bridges, or offshore power stations, or drill for oil in 300 feet of water, we do not yet have the ability to predict the consequences of these activities in ecological terms. We must face up to the realization that the conclusions of most environmental impact statements as they are performed today, are based on relatively easily obtainable information, but certainly not on all the information that is required to answer some very pertinent questions. Baseline studies and monitoring of chemical, physical and biological properties should be initiated immediately in areas that are expected to be impacted by offshore technological operations, however, one year baseline studies are not considered adequate for proper characterization of an area. Instruments and techniques need to be developed for more meaningful baseline and monitoring studies. No parameter can be disregarded simply because instrumentation and/or economical techniques for its study are currently unavailable. Laboratory studies investigating the function and interactions of species, populations and communities within the ecosystem must be initiated. (Sinha-OEIS)

Descriptors: *Streamflow, *Model studies, *Network design, *Regression analysis, Statistical method, Analytical techniques, Evaluation.

A procedure of streamflow network design is outlined using regression relations and assuming levels of acceptable errors in estimating the values of statistical parameters. Problems arise in the implementation of the procedure. One of these problems relates to the compounding of model and time errors. The term model error refers to the classical standard error of regression, whereas, the term time error refers to the error introduced by regressing estimates of the values of statistical parameters rather than the true values themselves on the values of the physiographical and meteorological variables. Another problem pertains to the relationship between the values of the statistical parameters needed to meet the condition of homoscedasticity in the regression relation. (Woodard-USGS)

Reprint from Proceedings of the Third Federal Inter-Agency Sedimentation Conference, 1976, held at Denver, Colorado, March 22-25, 1976: Water Resources Council, Sedimentation Committee, p 7-54 - 7-64, 1975. 11 p, 5 fig, 1 tab, 2 ref.

Descriptors: *Sediment transport, *Sampling, *Methodology, Research and development, Equipment, Pumps, Data collections, Sediment yield, Storm runoff.
Identifiers: *Sediment sampler.

The U.S. Geological Survey has used pumping-sediment samplers to study the sediment transport characteristics of small streams in Maryland for the last 10 years. Four different samplers developed by the Federal Inter-Agency Sedimentation Project were used to sample suspended sediment on five streams with drainage areas ranging from 1.2 to 54.6 square kilometres (0.47 to 21.1 square miles). A PS-62 sampler has been in continuous operation since its installation in 1966. The sampler provided satisfactory coverage for 139 of 220 storms between 1966 and 1975. Installation of a streamlined intake structure, commercial electrical power, and in-line battery chargers increased the reliability of the sampler from 32 percent in 1969 to 84 percent in 1973. It is estimated that the latest version of pumping samplers, the PS-69, would provide reliable service during 90 percent of the storms if the installation were properly designed and maintained. THE MODIFIED FERNOW FROST GAGE,
Massachusetts Univ., Amherst. Dept. of Forestry and Wildlife Management.
B. O. Wilen, and W. P. Mac Connell.
Soil Sci. 115(4), p 326-328, 1973.

Descriptors: *Gages, *Frost, *Instrumentation, Measurement, *Soil measurements, Depth.
Identifiers: *Fernow frost gage.

The Fernow Gage developed by Patric and Fridley was reported to give accurate measurements of soil frost penetration, except during periods of fast freezing and thawing when the tops of the gages were exposed to the weather and when soil frost penetration was shallow. These problems were caused by the heat conducted by the copper well-casing used to hold the gage. A modification solved the problem of the heat conduction by the well-casing by breaking the copper well-casing into short segments. The problem of the gage's inability to measure subsurface frost when the surface soil was unfrozen was also solved by inserting beads into the gage. The beads divided the gage into short compartments to prevent the whole column of ice from thawing when the surface soil thawed while the subsoil remained frozen.--Copyright 1974, Biological Abstract, Inc.

Descriptors: *Maps, *Soil structure, *Bedrock, eptic tanks, *Water pollution sources, Soil ag-regates, Soil compaction, Soil density, Mapping, erial photography, Geological surveys.
dentifiers: Morrison-Evergreen quadran-les(Colo).

his map shows the relative amounts of soil and ard bedrock within the upper 6 feet (1.8 m) of the and surface. It provides information useful for road-scale land-use decisions. The map is based n reconnaissance field studies and aerial-photo-raph interpretation. Although the unconsolidated naterials in this area are easily excavated for sep-ic systems with leach fields, the seasonal rise of he water table and local inundation of the surface nake this area one of high potential constraint. Only after careful site evaluation, especially dur-ng infiltration of the spring snowmelt, can this rea be considered safe for septic systems with each fields. Along major valleys, septic systems vith leach fields may drain through highly permea-le alluvial gravels and contaminate nearby treams. Septic systems with leach fields should e restricted to those few areas where acceptable mounts of unconsolidated material can be located n suitable slopes or where pervious fill can be dded. HYDROLOGIC DATA FOR MOUNTAIN CREEK, TRINITY RIVER BASIN, TEXAS, 1974,
Geological Survey, Austin, Tex.
H. D. Buckner.
Open-file report, May 1976. 13 p, 1 fig.

Descriptors: *Hydrologic data, Surface waters, *Streamflow, *Reservoirs, *River basins, *Texas, Rainfall, Runoff, Water yield, Water storage, Lakes.
Identifiers: *Mountain Creek(Tex), Trinity River basin(Tex).

Surface-water runoff and storage data collected during the 1974 water year in the Mountain Creek basin, Texas, are presented. Basin outflow for the water year was 80,480 acre-ft which is 7,310 acre-ft above the 14-year (1960-74) average of 73,170 acre-ft. Storage in Mountain Creek Lake showed a net loss of 1,030 acre-ft during the water year. Rainfall over the area was about 35 inches, which is about 1 inch above the long-term mean (1960-74). CONCEPT ANALYSIS: OFFSHORE BREAK-WATER-OIL STORAGE SYSTEM,
Raymond Technical Facilities Inc., New York.
J. Peraino, and T. Plodowski.
Available from the National Technical Information Service, Springfield, VA 22161, as AD-A010 348, $4.50 in paper copy, $2.25 in microfiche. Department of the Army Coastal Engineering Research Center Miscellaneous Paper No. 4-75, April 1975. 66 p, 23 fig, 4 tab, 7 ref, append. DACW72-73-C-005.

Descriptors: *Offshore platforms, *Breakwaters, *Oil industry, *Resources development, Continental Shelf, Environmental effects, Water resources, Storage, Deepwater, Harbors, Construction, Design.
Identifiers: *Deepwater ports, *Superports, *Petroleum, *Ports, U. S. East Coast, Breakwater-storage.

A satisfactory method of providing a prompt and efficient answer to the fast-growing need for deep-draft berthing facilities along the U. S. east coast is studied. The general concept of large hollow precast floating units towed to the site, and sunk into position lends itself particularly to using the hollow interiors as storage space for liquid bulk cargo in large quantities. Since the trend for more economical transportation of petroleum products is by use of large deep-draft carriers, the combination breakwater-oil storage system is a possible

solution. Assumptions were made as to probable site conditions, i.e., water depths, sea conditions, bottom conditions, and a preliminary design developed for the units. Various construction procedures were studied and compared from both technical and construction cost aspects. Once all technical advantages and disadvantages had been considered, the most suitable design was completed, a construction procedure laid out, and a basic budget estimate prepared. With this basic estimate, it was possible, with a series of factors, to adjust this basic cost to other water depths and other locations. Design principles, construction procedures and cost estimates are detailed in the report, including basic assumptions, sample design calculations, and estimate breakdown. (Sinha - OEIS)

ENERGY DISSIPATION ON A ROUGH SLOPE,
Massachusetts Inst. of Tech., Cambridge Dept. of Civil Engineering; and Massachusetts Inst. of Tech., Cambridge. Ralph M. Parsons Lab. for Water Resources and Hydrodynamics.
O. S. Madsen, and S. M. White.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 102, No. WW1, Proceedings Paper 11904, p 31-48, February 1976. 7 fig, 2 tab, 9 ref, 2 append.

Descriptors: *Coastal engineering, *Coastal structures, *Ocean waves, Unsteady flow, Energy dissipation, Slopes, Mathematical studies, Breakwaters, Waves(Water), Reflectance.
Identifiers: *Energy dissipators, Wave dispersion, Wave runup.

Assuming long normally incident waves, described by linear theory, the energy dissipation on a rough slope was accounted for by introducing a term expressing the bottom shear stress. The theoretical development leads to a determination of the reflection coefficient as a function of the horizontal extent of the slope relative to the wave length in front of the slope and an equivalent slope friction factor. A method for the accurate determination of the reflection coefficient from experimental data was developed and used to establish an empirical relationship for the frictional characteristics of a rough slope. The resulting semi-empirical procedure for estimating the reflection coefficient of rough slopes was shown to yield fairly accurate results. The results showed that bottom friction may account for the dissipation of 80% of the incident wave energy on a slope as large as 1:3 where the incident waves show no sign of breaking. TRANSVERSE FORCES ON VERTICAL CYLINDERS IN WAVES,
Cambridge Univ. (England). Dept. of Engineering.
M. de St. Q. Isaacson, and D. J. Maull.
Journal of the Waterways, Harbors, and Coastal Engineering Division, American Society of Civil Engineers, Vol. 102, No. WW1, Proceedings Paper 11934, p 49-60, February 1976. 10 fig, 18 ref, 2 append.

Descriptors: *Coastal engineering, *Coastal structures, *Underwater, *Piles(Foundations), *Ocean waves, Hydraulic models, *Waves(Water), Model studies, Laboratory tests, Vortices.
Identifiers: Lift, Pile structures, Transverse waves.

The results of a laboratory investigation into the development of forces on a vertical circular cylinder in regular waves were presented. The force transverse to the direction of waves propagation was examined in detail and its relation to the shedding of vortices was considered. It found that the Keulegan-Carpenter number is important in determining whether lift forces will be developed and at what frequency compared with the wave frequency. The unsteady pressure distribution round the cylinder at various depths has been measured and the sectional forces derived from these distributions. The flow in waves has been compared with that round a circular cylinder oscillating in still water. (Morris - ISWS)

HYDROLOGY FOR ENGINEERS, SECOND EDITION,
Stanford Univ., Calif.
R. K. Linsley, M. A. Kohler, and J. L. H. Paulhus.
McGraw-Hill, New York, N. Y. 1975. 482 p.

Descriptors: *Hydrologic data, *Engineering, *Hydrologic aspects, Climatic data, Precipitation(Atmospheric), Streamflow, Evaporation, Transpiration, Subsurface waters, Groundwater, Hydrographs, Runoff, Probability, Synthetic hydrology, Stochastic processes, Mathematical studies, Sedimentation, Channel morphology, Flooding, Floodwater, Watersheds(Basins).
Identifiers: *Engineering hydrology.

Hydrology describes the occurrence, circulation, distribution, and chemical and physical properties of the earth's waters. Engineering hydrology includes those segments of the field pertinent to design and operation of engineering projects, mainly hydraulic structures, for the control and use of water. Data collection and methods of analysis are broad catagories encompassing the design phase of hydrological engineering. Other factors which affect hydrologic conditions are weather, precipitation, streamflow, evaporation, transpiration, and subsurface water. Probability and stochastic hydrology are important considerations in the design of hydrologic structures. Sedimentation and river basin morphology are topics which lend themselves to an understanding and development of watershed analysis and planning. Each of these subjects are treated individually and in combination to provide a broad base for the study of engineering hydrology. (Heiss-NWWA)

HYBRID-ELEMENT METHOD FOR WATER WAVES,
Massachusetts Inst. of Tech., Cambridge, Dept. of Civil Engineering.
C. C. Mei, and H. S. Chen.
In: Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 63-81, 1975. 4 fig, 10 ref.

Descriptors: *Model studies, *Waves(Water), *Numerical analysis, Mathematical models, Computer models, Shallow water, Coasts, Harbors, Equations, Coastal engineering, Fluid mechanics, Hydraulics.
Identifiers: *Hybrid-element method.

A hybrid-element method for calculating water waves in an infinite fluid region was summarized. By introducing artificial boundaries the fluid region was divided into the finite-element region

vhich is the neighborhood of solid bodies and the uper-elements which are the neighborhoods of in-inity or of singular points. In the finite-element re-ion polynomial interpolating functions were used o represent the unknown function approximately. n the super-elements infinite series solutions were sed which satisfy exactly the governing equation nd the boundary condition at infinity or at the sin-ular point. Matching of the two regions at the ommon boundary was made easy by a special ariational principle. Numerical computations nly involved integrations in a finite domain and he inversion of a banded symmetric matrix. Ex-mples for shallow water waves in a harbor were iven. LARGE WAVE CHANNEL FOR 'FULL SCALE-MODELING' OF WAVE DYNAMICS IN SURF ZONES,
Technische Hochschule, Hanover (West Ger-many). Franzius-Institut fuer Grund und Wasser-au.
. Grune, and A. Fuhrboter.
n: Symposium On Modeling Techniques, Volume ; 2nd Annual Symposium of the Waterways, Har-ors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 975. American Society of Civil Engineers, New ork, p 82-100, 1975. 11 fig, 13 ref.

Descriptors: *Model studies, *Hydraulic models, Facilities, *Waves(Water), Surf, Beaches, Equipment, Research equipment, Research facili-ies, Fluid mechanics, Flumes, Channels, Hydrau-ics.

Simulation of wave dynamics in models is an ap-roved method for solving coastal engineering roblems. However, recent investigations have hown that the strong interactions in surf zones an neither be reproduced in small scale models ior described by theoretical derivations. Scale ef-ects due to air entrainment and to the scaling of each materials (sand) and certain structure naterials necessitate a 'modeling in full scale'. For his purpose, a full-scale wave channel is under reparation by SONDERFORSCHUNGBEREICH 79' at the niversity Hannover; the main dimensions of the hannel are: full depth 7.2 m, maximum water epth 5.0 m, width 5.0 m, length 320 m. Regular aves or wave spectra with wave heights up to 2.0 n will be generated. A description of this large ave channel was presented and an example of he need for modeling surf dynamics in full scale as given. (See also W76-09941) (Sims - ISWS)

WAVE MOTIONS IN AN OFFSHORE HARBOR,
Massachusetts Inst. of Tech., Cambridge. Dept. of Civil Engineering; and Massachusetts Inst. of Tech., Cambridge. Ralph M. Parsons Lab. for Water Resources and Hydrodynamics.
O. S. Madsen, and Y. K. Vyas.
n: Symposium on Modeling Techniques, Volume ; 2nd Annual Symposium of the Waterways, Har-ors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 975. American Society of Civil Engineers, New ork, p 101-119, 1975. 12 fig, 1 tab, 9 ref.

Descriptors: *Model studies, *Waves(Water), Nuclear powerplants, *Harbors, Hydraulic models, Breakwaters, Laboratory tests, Hydrau-ics.
Identifiers: *Offshore powerplants, Offshore har-ors.

Results of an experimental investigation of wave nduced oscillations in a model of an offshore uclear power plant were presented. The purpose f the investigation was to compare experimental nd theoretical results. The model was designed to eproduce as closely as possible the harbor model ssumed in the theoretical study. A thorough calibration of the test facility was presented, including an estimate of the expected accuracy of the results. Experimental results showed a fair agreement with theoretical predictions for tests performed with an empty breakwater enclosure, whereas a definitely poor agreement was obtained for the case of bottom seated power plants in place within the breakwater enclosure. The poor agreement was attributed to real fluid effects not accounted for in the theoretical model. The conclusion of the study was that the accuracy of model tests of this type primarily is governed by the degree to which the wave absorbers lining the basin are perfect. It is also found that the requirement of locating the model within the region of uniform incident waves in some cases may be relaxed. This may enable testing of large models in test basins of reasonable size. (See also W76-09941) (Sims - ISWS)
W76-09947

MODELING OF WIND-WAVES WITH JONSWAP SPECTRA,
Chicago Bridge and Iron Co., Plainfield, Ill. Marine Research and Development.
S. K. Chakrabarti, and R. H. Snider.
In: Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 120-139, 1975. 12 fig, 9 ref, 1 append.

Descriptors: *Model studies, *Waves(Water), *Ocean waves, *Atlantic Ocean, Oceans, Winds, Storms, On-site investigations, On-site data collections, Mathematical models, Hydraulics.
Identifiers: *North Sea, *Wave spectra, Overshoot parameter, Spectral energy, JONSWAP wave spectra.

The Joint North Sea Wave Project (JONSWAP) spectra represent the best least square fit to the observed spectra during ideal generation conditions in the North Sea. It is more sharply peaked than the Pierson-Moskowitz spectrum for the fully-developed sea. The mean overshoot parameter for the North Sea Project was found to be 3.3. Wave energy spectra recorded during past and recent North Atlantic storms were compared here with the spectral model empirically derived during the Joint North Sea Wave Project. For these North Atlantic storms, the overshoot parameter was found to vary between 1 and 4.4. The overall comparison of the recorded unimodal energy spectra with the JONSWAP model was found to be generally good. Also, the measured significant wave heights correlated well with the significant JONSWAP heights. (See also W76-09941) (Sims - ISWS)

USE OF MATHEMATICAL MODELS IN THE PALO ALTO MARSHLAND REHABILITATION PROJECT,
Water Resources Engineers, Walnut Creek, Calif.
D. L. Tucker, D. F. Kibler, J. R. Monser, L. C. White, and B. L. Pawloski.
In: Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 140-158, 1975. 12 fig, 1 tab, 4 ref.

Descriptors: *Model studies, *Marshes, *Rehabilitation, *California, Mathematical models, Wetlands, Coasts, Tidal waters, Tidal marshes, Hydraulic properties, Flood control, Harbors.
Identifiers: *Palo Alto(Calif), Flood basins.

This paper described the recent use of mathematical models in the Palo Alto marshland restoration and Yacht Harbor study conducted by Water Resources Engineers for the City of Palo Alto. The 600 acre marshland area to be restored presently serves as a flood basin created 25 years ago by perimeter levees and a tidal headworks which closed the basin to tidal inflows from San Francisco Bay. The basin area has been designated recently by the City as a wetland preserve in which it is desired to establish a balanced marsh habitat having both fresh and salt water communities. At the same time, the restored marshland must retain its present function as a flood storage basin for protection of the City during periods of excessive urban runoff and high tides. The primary objective of the study thus was to devise and simulate hydraulic measures for introducing an artificial tidal circulation in the Flood Basin which also would meet the essential flood storage requirements. A second objective was to simulate the increase in hydraulic circulation and reduction in channel shoaling in the adjoining Yacht Harbor resulting from controlled Flood Basin releases. Details of the model structure for both the Flood Basin and Yacht Harbor, together with their respective roles in guiding engineering judgment, were provided. Sedimentation and other environmental factors were also discussed. (See also W76-09941) (Sims - ISWS)

SOME HARD LESSONS IN NUMERICAL HYDRAULICS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
R. H. Multer.
In: Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 208-219, 1975. 7 ref, append.

Descriptors: *Model studies, *Hydraulic models, *Mathematical models, *Numerical analysis, Hydraulics, Mathematics, Mathematical studies, Computer models, Equations.
Identifiers: *Boundary conditions.

Methods which may be used to solve problems in numerical hydraulics were surveyed. Available techniques have been used satisfactorily in a number of numerical studies. There are, however, basic pitfalls which may trap the unwary modeler and cause him to produce highly erroneous results. The most significant of these would seem to be the improper specification of boundary conditions and/or careless interpretation of numerical results relative to the boundary condition specified. The problem of boundary conditions is not a special characteristic of numerical models; it also occurs in physical model studies. Boundary conditions may be particularly troublesome in investigations in which modifications of the hydraulic system are to be studied. Numerical modeling results should be carefully examined to determine if system modifications are influencing boundary conditions. If this is the case, it may be essential to use alternate boundary conditions. (See also W76-09941) (Sims - ISWS)

SIMULATION OF TIDAL HYDRODYNAMICS - MASONBORO INLET,
Water Resources Engineers, Inc., Austin, Tex.
F. D. Masch, and R. J. Brandes.
In: Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 220-239, 1975. 8 fig, 11 ref. CERC DACW72-72-C-0028.

Descriptors: *Model studies, *Inlets(Waterways), *Mathematical models, *North Carolina, Channels, Jetties, Estuaries, Coasts, Velocity, Tides, Tidal waters, Flow, Hydraulics, Hydrodynamics.
Identifiers: *Masonboro Inlet(NC).

A two-dimensional finite difference tidal hydrodynamics model has been adapted to Masonboro Inlet, North Carolina. The model was calibrated for prototype conditions of September and October, 1969. Operational runs simulated tides and currents corresponding to pre-project undeveloped inlet conditions of November 1964, and modified inlet and north jetty conditions of June 1967. For each case, the model was operated with mean and spring tides. The model applied uses an explicit numerical solution of the two-dimensional equations of motion and continuity. It accounts for the effects of variable bathymetry, bottom roughness, tidal inundation, wind setup, weir flow over a section of the jetty and other system features. Because of the size and detail required in the simulations, a dual-model approach was employed. In this procedure, a coarse grid model was used to compute tidal flows which were then applied as boundary conditions to a fine grid sub-model of the immediate inlet area. Verification of the dual-grid model was accomplished through comparisons of measured and simulated tides at six gage locations and measured and simulated tidally generated velocities at fifteen stations throughout the inlet area. Further verification was obtained through comparisons of tidal prisms in selected areas common to the coarse and fine grid models. Results of operating the models under different ocean tides and with pre- and post-project bathymetry included water surface elevation and tidal velocity simulations at each of the stations used in the model verification. In: Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 294-314, 1975. 10 fig, 4 tab, 3 ref.

Descriptors: *Hydraulic models, *Evaluation, *Inlets(Waterways), Velocity, Flow, Tides, Waves(Water), Ocean waves, Model studies, Coasts, Beaches, Estuaries, Jetties, Hydraulics.
Identifiers: *Masonboro Inlet(NC).

An evaluation of state-of-the-art tidal inlet hydraulic model procedures was performed to determine the usefulness and reliability of a physical model to accurately predict the hydraulic characteristics of an inlet-bay system. Masonboro Inlet, a single-jettied inlet on the North Carolina coast, was selected as the prototype. The Masonboro Inlet tidal model was constructed to scales of 1:300 horizontally and 1:60 vertically. Model calibration tests assured that the model tidal heights and velocities were in agreement with those of the prototype 1969 conditions. To evaluate the model's predictive capability under different conditions, an additional set of hydraulic data was collected in July 1974, after the inlet thalweg had migrated further northward against the jetty. Tidal heights, velocities, and surface flow patterns using dye streaks were obtained in the prototype. The model was remolded to the 1974 bathymetry, and data were collected at identical locations as in the prototype. Using the same roughness distribution as the verified 1969 condition, velocity and tides were shifted one-half hour due to too much roughness at the entrance because of the narrower but deeper cross section. Model bay tide ranges were 11% less than the prototype and velocities averaged 0.6 ft/sec different than prototype, although the average difference in maximum velocities was only 0.3 ft/sec. Model dye streak patterns showed good agreement with the prototype when wind waves were reproduced, better than a nonwave condition. Also wave reproduction improved model-prototype velocity comparisons at the inlet entrance. (See also W76-09941) (Sims-ISWS)

PRINCIPLE OF MANAGEMENT OF DEGENERATED INLETS AND ESTUARIES,
Laval Univ., Quebec. Dept. of Civil Engineering.
M. Frenette, Y. Ouellet, A. Poire, and J-L. Verrette.
In: Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 315-334, 1975. 12 fig, 1 tab, 13 ref.

Descriptors: *Management, *Inlets(Waterways), *Model studies, Hydraulic models, Estuaries, Coasts, Channels, Erosion, Sedimentation, Salinity, Saline water intrusion, Tides, Waves(Water), Rivers, Discharge(Water), Hydraulics.

Efficient and proper utilization of inlets and estuaries requires a good knowledge of the evolution of the physical, hydraulic, sedimentological and biological components. Very often, a management can serve a cause to the detriment of another one. Research on scale model has been undertaken in order to define some principles of solutions for the management of degenerated inlets and estuaries so that a channel could be created without bringing too much change to the other aspects of the inlets or estuaries. The model itself represented a river interconnected with a maritime basin by means of an estuary. Fluvial hydrograms, sediment histograms, bed morphology, tides, salt-water and freshwater, and coastal currents and waves, as well as different techniques of management, were simulated in the model. PHYSICAL MODEL OF DISCHARGE IN A TWO-LAYER STRATIFIED AMBIENT,
Duke Power Co., Charlotte, N. C.
B. L. Sill, and B. L. Edge.
In: Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 388-406, 1975. 13 fig, 1 tab, 12 ref.

Descriptors: *Model studies, *Stratification, *Jets, *Reservoirs, Hydraulic models, Density stratification, Pumped storage, Mixing, Buoyancy, Thermal stratification, Conductivity, Measurement, Instrumentation, Dye releases, Diffusion, Dispersion.

A physical model was used to study the degree of mixing produced by neutrally buoyant discharges into stratified ambients. The discharge was located at the interface between the hypolimnion and the epilimnion to produce as much mixing from these two layers as possible. The physical model used a salt solution to create the original stratification. The most important results were: (1) large volumes and surface areas (over 1000 gallons and 150 sq ft) can be stratified quickly and uniformly with the floating diffuser technique developed; (2) except in the zone of flow development, visual and conductivity measurements show that the discharge moves as an interlayer between the epilimnion and hypolimnion and does not effectively mix fluid from above and below; (3) a simple analytical model developed to describe plume movement into a stagnant thermocline agrees well with experimental values; and (4) for condition test, discharge into the epilimnion did not adversely affect the stratification in the far field. In: Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 466-483, 1975. 8 fig, 2 tab.

Descriptors: *Model studies, *Alluvial channels, *Mississippi River, Mathematical models, Erosion, Sedimentation, Sediments, Geomorphology, Channel morphology, Rivers, River beds, Sand waves, Flow, Unsteady flow, Streamflow.

For study of the important aspects of the unsteady flow phenomena in alluvial channels, a mathematical model was utilized to represent the original hydraulic system. The model was developed by formulating the unsteady flow of sediment-laden water with the one-dimensional partial differential equations representing the conservation of mass for sediment, and the conservation of mass and momentum for sediment-laden water. The effects of lateral water and sediment inflow, the sediment motion, the fluid friction, and the irregular channel geometry were considered. The set of equations were solved by a linear-implicit method using a digital computer. The mathematical model developed was valuable for studying various types of unsteady flow problems in open channels such as the flood routing of water and sediment in channels, degradation and aggradation near hydraulic structures, and channel response to development. To test the mathematical model two practical applications were analyzed. First, a mathematical model was used to simulate the propagation of sand waves in a laboratory flume. Second, a mathematical model was utilized to study the geomorphic changes in the Upper Mississippi River and the adjacent land. The simulated flows generated by the mathematical model compared well with field measured data. (See also W76-09941) (Sims - ISWS)

ndistorted movable-bed model similarity criteria or quasi-steady flows around and inside hydraulic tructures located along curved alluvial streams ere developed. These similarity conditions were pplied to a model study of flow conditions and ediment movement of the Missouri River in the icinity of and within an intake structure of the ooper Nuclear Station, near Brownville, ebraska. The test results confirmed their applica-ility. The model study revealed that a combina-on of trailing wall and skimming weir placed arallel to the face of the intake structure was the ost effective sediment-reducing scheme that also atisfies the Corps of Engineers channel-en-roachment constraint. This scheme was installed n the Missouri River in August 1974, and has esulted in significant reduction in size and quanti-y of sediment entering the circulating/service ater systems. dentifiers: *Riverbank recessions.

ocking facilities and cooling water intake struc-ures along large rivers are sometimes expensive nd difficult to construct because of bankline in-tabilities and large velocities in the river. These ifficulties can be overcome by excavating a ecession in the river bankline for the facilities. ithin the recession, the flow field is charac-erized by one or more large vortices with vertical xis. The vortices pump sediment and floating ebris from the main channel into the recession nd cause increased turbulence levels along the ankline immediately downstream of the reces-ion. Because of the vortex motion, it is expedient o locate the cooling water discharge structure out-ide and downstream of the recession. To obtain nformation to assist in the design of a bank reces-ion, a 1/50-scale rigid-bed hydraulic model of a 1-nile reach of the Lower MIssissippi River channel vas tested. Velocity fields were measured in the nodel channel and recession and the movements of lightweight sediment and surface debris were mapped. These data and Toffaleti's sediment transport equations were used to estimate sedimentation rates in the recession. The shape and orientation of the recession was varied to achieve a good compromise solution for design. (See also W76-09941) (Sims - ISWS)

Identifiers: *Stratified fluids, Modeling techniques.

The 'design system' or 'computational system' builds and runs mathematical models of a given class when presented only with the basic model description. Two design systems for stratified flows were described: the S12/13 for one-dimensional two- and three-layer flows, and the S22/23 for two-dimensional two- and three-layer flows. Each system possesses hydrodynamic, transport-dispersion, and water quality stages. Together, these systems comprise the 'Neptune' project. Some specific difficulties and problems associated with the development of the systems were outlined, with illustrations. The systems approach appears to make possible the simulation of stratified flows and associated water quality phenomena with acceptable accuracy-cost characteristics. CONSTRUCTION PLANNING OF A HYDRO POWER STATION,
Beas Designs Organization, Nangal (India).
O. P. Datta.
Indian Journal of Power and River Valley Development, Vol. XXV, No. 3, p 77-81, March 1975. 3 fig, 6 ref.

Descriptors: *Construction, *Planning, *Hydroelectric plants, Size, Excavation, Design, Water resources, Penstocks, Drainage, Equipment, Storage, Installation, Sites.
Identifiers: Concrete production.

Described are the important features that are associated with the planning and construction of a hydro power station. Factors governing the location of power-houses are discussed with relative merits, and criteria for the type and size of units are explained. Considered are excavation, concrete production and placement, penstock chamber, and drainage arrangements. Composite flow sheet charts for major construction operations of excavation and concrete production would help in judicious planning of sequential operations. After deciding the location and size of a hydro power station, it is advantageous to plan carefully the construction operations, starting from excavation and concrete placement to coordinated installation of generating equipment in order to achieve the targets of completion of the structure and to keep to the commissioning schedule. OPERATION OF HYDROGENERATOR AS SYNCHRONOUS CONDENSOR,
Bharat Heavy Electricals Ltd., Hardwar (India).
S. C. Mukhopadhyaya.
Indian Journal of Power and River Valley Development, Vol. XXV, No. 4, p 113-115, April 1975. 4 fig, 4 ref.

Descriptors: *Hydroelectric plants, *Generators, *Condensers, Transmission line, Operations, Costs, Economic efficiency, Equipment.
Identifiers: *India.

A large number of hydro stations in India are either seasonal or peak load stations, and the generators in such stations have long idle time. This idle time of the generators can be economically used to run as synchronous condensors to reduce the transmission line losses and to utilize the available sources of power to maximum extent. Hydro stations mainly situated far away from the load centers, however, offer little advantage in running them as synchronous condensors. But there are many hydrostations in India around which industrial complexes or plants having large consumption of power have been constructed. These consumers are mainly supplied from the

nearby hydro stations. But sometimes power is fed from sources located at long distances. The analysis herein concludes that the running of hydro sets as synchronous condensors is very convenient and the expenditure involved in providing additional equipment is negligible. The modifications required to provide such facilities in existing power houses are also not much, as no change is involved in the main equipment. The only requirement is the provision of air inlet to runner chamber and some minor changes in control circuit. (Bell-Cornell)

SLUICE GATES HELP REGULATE PLANT'S HYDRAULIC FLOWS.
Water and Sewage Works, Vol. 123, No. 5, p 77-79, May, 1976.

Descriptors: *Sluice gates, *Hydraulic gates, Hydraulic structures, *Flow control, *Sewage treatment, *Waste water treatment, Engineering structures, Gates, Sewage lagoons, Activated sludge, Sanitary engineering, Treatment facilities.
Identifiers: Contact stabilization.

A sluice gate arrangement for regulating hydraulic flows at a new Jackson, Mississippi, sewage treatment plant is described. The plant uses an activated sludge treatment process with contact stabilization and is designed so that influent must either be processed or temporarily stored in lagoons when flooding conditions exist. Comminuters and grit chambers in the plant make use of a 16-gate arrangement to control flows. Four 42 by 36-inch sluice gates are arranged around a comminuter pool controlling flows to four additional gates located at the grit chamber influent. Eight other gates are located on the grit chamber. Flow from the grit chambers passes on to the contact stabilization tanks, reaeration tanks, and ultimately to clarifiers. Four 48 by 48-inch gates located in the contact tanks and eight 30-inch diameter gates in the aeration tanks can be modulated to regulate flows in accordance with commands given by a control room operator who has access to flow meter readings. When the plant reaches its hydraulic capacity of 60 million gallons, excess flow is diverted to lagoons via a 60-inch diameter storm water bypass gate. Other gates at the plant include three self-contained gates at the effluent end of the chlorination lagoon and an additional modulating gate at the effluent outfall. (Kreager-FIRL)

NEAR-FIELD JET PENETRATION AND RESERVOIR MIXING,
Georgia Inst. of Technology, Atlanta.
P. G. Mayer.
In: Symposium On Modeling Techniques, Volume I; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 380-387, 1975. 4 fig.

Descriptors: *Model studies, *Hydraulic models, *Reservoirs, *Jets, Mixing, Dispersion, Circulation, Powerplants, Pump turbines, Pumped storage, Photography, Dye releases.
Identifiers: *Jet penetration.

The objectives were to build and operate hydraulic models which would (1) assist the Georgia Power Company in deciding on relative locations of the power house and the spillway in its Wallace Dam Pumped-Storage project, and (2) define factors pertinent to the locations of four reversible pump-turbine units and of two conventional turbine units within the power house. The laboratory investigations were conducted with two different models. One model was an idealized undistorted model built on a scale of 1:400. This model served to gather information useful to the construction and operation of a second and considerably more comprehensive reservoir model. The reservoir model was built on a distorted scale of 1:400 horizontally and 1:60 vertically. The models were operated on appropriate time-scales. Jet penetration and reservoir mixing were studied by means of dye injections. The operation of the reservoir model included both pumping cycles and generating cycles. Time-lapse color photography was used to study and analyze the jet geometrics and the jet induced reservoir mixing patterns. The results of these studies were immediately useful to the design engineers in the selection of a suitable configuration for turbine settings. The results to date were also useful in the examination of water quality aspects arising from the projects during operation. (See also W76-09941) (Sims - ISWS)

POLYETHYLENE PIPE TACKLES DIFFICULT SEWER REPAIR JOB,
Water and Sewage Works, Vol. 123, No. 2, p 48, February, 1976.

Descriptors: *Sewers, *Repairing, *Plastic pipes, Installation.
Identifiers: Slip-lining, *Pipe relining.

A difficult sewer repair problem at La Mesa, California, was completed by the insertion of long, fused lengths of polyethylene pipe. A 55-year-old six-inch concrete sewer located in an area of beautifully landscaped homes on a steep, rocky hillside was badly in need of replacement due to heavy infiltration and exfiltration and stubborn root penetration which was causing stoppages. The first step was to inspect the line by video camera, recording the interior. Polyethylene pipe (OD 5.375 inches) was pulled through the pipe in 38-foot sections. As each section was lined, lateral connections were made. The project required five weeks to complete 3000 feet of relining; service was interrupted only when lateral connections were being effected. The final cost was much less than that of direct replacement. (Orr-FIRL)
W76-09403

HOW MANY SEWER LEAKS CAN YOU AFFORD.
Weston (Roy F.), Inc., Houston, Tex.
D. S. Diehl.
The American City and County, Vol. 91, No. 4, p 55-57, April, 1976.

Descriptors: *Sewers, *Sewerage, *Pipelines, *Infiltration, *Inflow, *Repairing, Measurement, Instrumentation, Drainage, Rainfall.
Identifiers: Sewerage construction grants, Infiltration/inflow.

The basic problems caused by infiltration/inflow (i/i) in a sewer system are: excessive maintenance, discharge of poorly treated waste water during periods of high groundwater or rainfall, backups and overflows of raw sewage, surchaged sewer lines which prevent the use of plumbing facilities in low-lying areas; and the overloading of treatment plants, pump stations and interceptors. Sewer systems are eligible for federally funded sewerage construction grants, provided an infiltration/inflow analysis demonstrates that it would be more economical to repair the sewers than to treat the i/i. In order to estimate the magnitude of i/i to which a system is subject, the peak, average and minimum flows during dry and wet weather for major sections must be determined. Three flow measuring devices generally used are Cipolletti weirs with liquid level recorders, event recorders, and bypass times. In evaluating the system, each manhole must be physically inspected on a drainage basin by drainage basin basis. In some systems, it is cost effective to smoke test the manhole and lines leading to it. Other steps in the evaluation include simulation of rainfall and quantification of the rate of infiltration or inflow from a particular source or suspected manhole or sewer section. Those lines with obvious potential for 'excessive' i/i should be cleaned and internally inspected with closed circuit TV. A final evaluation report must show all i/i sources as well as justification and a method for rehabilitation and repair of specific sections. (Kramer-FIRL)
W76-09404

POLYETHYLENE PIPE INSERTION REHABILITATES OLD SEWERS,
Freeport Public Works, N. Y.
E. H. Prefer.
Water and Sewage Works, Vol. 123, No. 4, p 92-94, April, 1976.

Descriptors: *Sewers, *Pipelines, *Plastic pipes, *Inspection, Testing, Equipment, Repairing, Rehabilitation, Sewerage, Costs.
Identifiers: *Pipe relining.

Sewers can be rehabilitated with less cost and disruption by inserting a new polyethylene pipe inside the old sewer pipe than by replacing the whole pipline. The existing sewer line must be inspected before inserting new pipe; TV or other methods may be used for the inspection. Lengths of polyethylene pipe are joined by heat fusion, producing a joint as strong as the pipe itself. The new pipe is inserted by pulling it into the old pipe with a cable. When shallow house service lines are connected to deep sewers by vertical risers, an expandable connector can be inserted through the top of the riser. When excavation down to the connection spot is required, fusion saddles or, when conditions are wet, tapping saddles may be used. After the houses are connected, the annular space between the old and new sewer pipes is sealed. Such a renewal project was carried out in Freeport, New York, where many of the sewers were badly deteriorated and one section had caved in. The initial insertion involved lining a 565-ft length of lightly deteriorated 8-in. pipe. The sewer section that had caved in was replaced with clay pipe, but the parallel section on the other side of the street was lined with polyethylene pipe. No obstructions were encountered in lining the first section, but the second section, which had not been inspected immediately before insertion, became jammed with material flaking off the original pipe. The re-lining and reconnection were nevertheless completed in 5 days, at a savings of 90% as compared to the replacement of clay pipe on the other side of the street. (Snyder-FIRL)

W76-09459

SEWER INSPECTION: CHECKING IT OUT,
L. Fielding.
Water and Wastes Engineering, Vol. 13, No. 4, p 6, April, 1976.

Descriptors: *Sewers, *Maintenance, *Cleaning, Repairing, Inspection, Equipment, Maintenance costs.
Identifiers: *Television inspection.

Trends and commonly used techniques for sewer inspection and maintenance are discussed. Visual on-site inspection is the most commonly used inspection method. Closed circuit television cameras are becoming more commonly used. The sewers in Sparks, Nevada, are inspected visually in manholes and internally by a closed circuit television system. The visual inspection is performed weekly, while television inspection is performed on a time available basis. Rodders, vacuum units, electric eels, and buckets and brushes are all used to varying degrees to clean sewers. Tree roots are the most common problem found in routine maintenance. Slip-liner technology for the replacement of deteriorated mains is being considered by Oklahoma City. The frequency of inspection and maintenance depends on available manpower and time. Money is another important factor. At Sparks, Nevada, about 5% of the system is inspected visually weekly, 10% is cleaned every three months, 5% is cleaned every year, 15% is cleaned every two years, 20% is cleaned every five years, and about 40% is not cleaned. Approximately 48% of the utility budget of Sparks is spent on sewer inspection and maintenance. (Orr-FIRL)

GRP LAUNDERS AT SEWAGE TREATMENT PLANT.
Reinforced Plastics, Vol. 20, No. 2, p 44-45, February, 1976.

Descriptors: *Sewage treatment, Equipment, *Plastics, Construction materials, *Waste water treatment, Corrosion control, Treatment facilities.
Identifiers: Launders, *Reinforced plastics.

New glass fiber reinforced plastic (GRP) launders and diffusers have been developed for use in sewage treatment plants. These plastics give increased strength and a high surface finish, with the incorporation of high density polyurethane foam in their sandwich construction. These launders, or trough-shaped conduits, had formerly been constructed of concrete and steel. With the lighter reinforced plastic construction, the equipment will be easier to transport and hoist and will discourage the growth of algae. (Kramer-FIRL)

EXPERIMENTS ON THE CULTURE OF THE LARGE SNAKE-HEAD OPHICEPHALUS MARULIUS (HAMILTON),
Reg. Cent., Mandapam Camp, Tamil Nadu, India, Cent. Mar. Fish. Res. Inst.
M. Devaraj.
Indian J Fish. 20(1), p 138-147, 1973.

Descriptors: *Fish, Swamps, Fish hatcheries, Wells, *Growth rates, Breeding.
Identifiers: Snake-Head, Ophicephalus-marulius, Tilapia-mossambica, Fish breeding.

The growth of fry and fingerlings of O. marulius is 32 mm/mo. in a swamp, 15.6 mm in a nursery, 6.4 mm in a backyard well and up to 29 mm in irrigation wells under different feeding conditions. During the 1st yr of the experiment in a farm pond where forage fishes were introduced, the monthly growth of 1 and 2 yr old O. marulius was 12 mm and 8 mm respectively. Eutrophification of the pond during the2nd yr increased the growth rate to 33 mm in fingerlings and 27 mm in 1 yr old fish. Survival of fingerlings during the 1st yr was 1.3% in the nursery, 13.6% in backyard wells and 34.0% in irrigation wells. Recovery from farm ponds where adult fishes were grown, ranged from 57.5 to 100% in a period of 1-1 1/2 yr. This was due to breeding in the pond which resulted in the production of younger fish of size-groups much smaller than those stocked. When the juveniles attained about 125 mm in length (4-5 mo. old) they became piscivorous and dispersed from the broods. They should be collected at this stage for stocking purposes. Rate of stocking in wells should not exceed 10 fish/well. For culture in farms, 0.25-0.5 ha ponds and a stock rate of 1000-4000 fingerlings/ha are suggested. Tilapia mossambica of less than 80 mm formed the chief food of O. marulius on the farm. Desparity in the growth rate within the same habitat increased cannibalism and hence mortality of smaller ones was high. The importance of periodic netting for the larger fish is emphasized.--Copyright 1975, Biological Abstracts, Inc.
W76-09487

ENGINEERING RECLAMATION, A MOST IMPORTANT MEANS OF INCREASING FISH PRODUCTIVITY OF WATERS, (IN RUSSIAN),
Ukrainian Research Inst. of the Fish Industry, Kiev (USSR).
G. I. Shpet, and I. F. Demchenko.
Gidrobiol Zh. 9(4), p 87-90, 1973.

Descriptors: Fish management, *Fish reproduction, *Productivity, *Fisheries, Ponds, Fertilizers, Drainage, Fish diets, Grading.
Identifiers: *Engineering reclamation.

The application of feed and fertilizer is an important means of increasing the productivity of pond fisheries, but engineering reclamation is also important. The productivity of a pond depends on a number of hydrological conditions (pond area, depth, flow, drainability) which can be improved by engineering. Although there is no obvious proportional relationship between pond size and productivity, ponds with an area of 50-150 ha are the most productive since such ponds are more amenable to the use of mechanization and hydraulic engineering. Drainability, cultivation and grading of pond bottom are important features in engineering reclamation. A good reclamation system and graded bottom provide complete draining and shorten fish catching time by 3-4 times.--Copyright 1975,Biological Abstracts, Inc.

PHYSIOLOGIC RESPONSES TO WATER IMMERSION IN MAN: A COMPENDIUM OF RESEARCH,
National Aeronautics and Space Administration, Moffett Field, Calif. Ames Research Center.
J. Kollias, D. Van Derveer, K. J. Dorchak, and J. E. Greenleaf.
NASA Technical Memorandum, TM X-3308, February, 1976, 74 p, 245 ref.

Descriptors: *Animal behavior, *Animal physiology, *Biology, *Bibliographies, *Abstracts, Environmental effects, Laboratory animals, Mode of action, Moisture stress, Reviews, Information retrieval, Environmental engineering, Manpower.
Identifiers: *Water immersion, Physiological responses(Human), Space flight, Weightlessness, Zero-gravity effects, Fluid immersion, Simulated environments.

Since the advent of space flight programs, scientists have been searching for ways to reproduce the zero-gravity effects of weightlessness. Brief periods of weightlessness up to 1 minute were feasible using Keplerian trajectory, but comprehensive study of the prolonged effects of the weightless state necessitated the development of other methods. Thus far the two approaches most widely used have been complete bedrest and fluid immersion. Surprisingly, these simulated environments have produced essentially all of the symptoms found in astronauts. This compendium contains reports appearing in the literature through December, 1973. When the author's abstract or summary was adequate, it was used. If these were not available a detailed annotation was provided under the subheadings: (a) purpose, (b) procedures and methods, (c) results, and (d) conclusions. The annotations are in alphabetical order by first author; author and subject indexes are included. Additional references are presented in the selected bibliography. (Katz)

A Screening Bioassay Using Daphnia Pulex for Refinery Wastes Discharged into Freshwater,
W76-09653 5A

Environmental Quality Research, First Annual Report,
W76-09654 5C

BIOASSAYS
Development of Laboratory Model Ecosystems as Early Warning Elements of Environmental Pollution,
W76-09643 5C

The Role of Bioassays in Environmental Research,
W76-09644 5A

Substitute Chemical Program - Initial Scientific and Minieconomic Review of Captan.
W76-09651 5C

BIOCHEMICAL OXYGEN DEMAND
Wastewater Treatment System with Controlled Mixing,
W76-09433 5D

A Study of Rotating-Disc Treatment Units Operating at Different Temperatures,
W76-09674 5D

Effluent Detention Ponds Dechlorinate Wastewater,
W76-09678 5D

The Effluent Lagoons Greifswald-Ladebow (Das Abwasserteichsystem Greifswald-Ladebow),
W76-09682 5D

Possibilities and Limits of Extended Waste Water Purification (Moeglichkeiten und Grenzen der Weitergehanded Abwasserreinigung),
W76-09683 5D

Technique Alternatives for a Package Stabilization Plant,
W76-09705 5D

Biological Production Processes in the Ural River, (In Russian),
W76-09919 5C

BIOCHEMISTRY
Studies on the Metabolism of a Sulfur-Oxidizing Bacterium. VII. Purification and Characterization of Soluble Components Indispensables for Sulfur Oxidation by Thiobacillus Thiooxidans,
W76-09592 5C

BIOCONTROL
Possibilities and Limitations in Biological Control of Weeds,
W76-09920 4A

Recent Trends in Weed Control in Freshwater,
W76-09921 4A

BIODEGRADATION
Effects of Gamma Radiation from Co60 on Dilute Aqueous Solutions of Linear Alkyl Sulfonate Surfactants and other Organic Pollutants,
W76-09531 5D

Methods for Measurement of Biodegradability of Chemical Compounds,
W76-09599 5C

Development of Laboratory Model Ecosystems as Early Warning Elements of Environmental Pollution,
W76-09643 5C

Biodegradability and Process for Biological Purification of Waste Water (La Biodegradabilite et Les Procedes D'Epuration Biologique Des Effluents),
W76-09693 5D

BIOGEOCOENOSES
Use of the Principles and Methods of Radio-Ecology in Solving Some Urgent Problems of Man's Effect on the Environment, (In Russian),
W76-09936 6G

BIOHYDROCENOSES
Anthropogenic Effect on Continental, Marine, and Oceanic Biohydrocoenoses, (In Russian),
W76-09819 5C

BIOINDICATORS
Myxobacteria of the Myxococcus Group as Indirect Indicators of Fecal Matter in Surface Water: 1. Communication, (In German),
W76-09591 5A

Species Composition and Diversity of Polychaetes in the New York Bight,
W76-09650 5C

Balanidae as Pollution Indicators in the Bay of Guanabara, (In Portuguese),
W76-09823 5A

Biological Indicators of Environmental Quality. A Bibliography of Abstracts,
W76-09860 5A

BIOLOGICAL COMMUNITIES
Ecosystem Modeling,
W76-09645 5C

BIOLOGICAL ENERGY SOURCES
Arizona Energy: A Framework for Decision.
W76-09484 6D

BIOLOGICAL TREATMENT
Sludge Control and Decant System,
W76-09419 5D

Apparatus for Sewage Treatment and Wastewater Reclamation,
W76-09420 5D

Waste Purification System,
W76-09431 5D

Waste Treatment Apparatus,
W76-09432 5D

Who Says Sewage Treatment Plants Have to be Ugly,
W76-09437 5D

Some Critical Views of Selected Processes for the Biological Treatment of Sewage,
W76-09457 5D

A Study of Rotating-Disc Treatment Units Operating at Different Temperatures,
W76-09674 5D

Assessment of Virus Removal by a Multi-Stage Activated Sludge Process,
W76-09676 5D

Possibilities and Limits of Extended Waste Water Purification (Moeglichkeiten und Grenzen der Weitergehanded Abwasserreinigung),
W76-09683 5D

Biodegradability and Process for Biological Purification of Waste Water (La Biodegradabilite et Les Procedes D'Epuration Biologique Des Effluents),
W76-09693 5D

Technique Alternatives for a Package Stabilization Plant,
W76-09705 5D

Method of Biological Purification of Industrial Effluents from Chromates and Bichromates,
W76-09856 5D

BIOLOGICAL TREATMENTS
Sanitary Waste Treatment Plant,
W76-09414 5D

BIOLOGY
Physiologic Responses to Water Immersion in Man: A Compendium of Research,
W76-09655 10C

BIOMASS
Studies of Phytoplankton Ecology in the Bay of Valparaiso: II. Phytoplankton 1970-1971, (In Spanish),
W76-09408 5A

Rotifer Production in Lake Baikal, (In Russian),
W76-09791 5C

The Primary Production of Phytoplankton in Lake Balaton April-September 1972,
W76-09992 5C

BIXLER RUN BASIN (PA)
Hydrology and Sedimentation of Bixler Run Basin, Central Pennsylvania,
W76-09830 2J

BLUEFISH
The Effect of Temperature on the Behavior of Marine Fishes, a Comparison Among Atlantic Mackerel, Scomber Scombrus, Bluefish, Pomatomus Saltatrix, and Tautog, Tautoga Onitis,
W76-09507 5C

BOGS
The Qualitative Organic Matter Composition of Some Marshy Soils of Nizhnevelikoretsk Plain, (In Russian),
W76-09888 2G

BOND ISSUES
Financing Pollution Abatement Equipment for Textiles and Other South Carolina Industries.
W76-09766 5G

Role of the Underwriter in Tax Exempt Financing for Industrial Expansion and Pollution Control,
W76-09768 5G

The Industrial Revenue Bond for Pollution Control: One Company's Perspective,
W76-09769 5G

Financing Pollution Control Projects in South Carolina Using Tax-Exempt Industrial Revenue Bonds,
W76-09770 5G

The Pollution Control Bond,
W76-09771 5G

BOREHOLES
Operation and Maintenance of a Deep-Well Water-Level Measurement Device, 'The Iron Horse',
W76-09835 4B

BORON
Removal of Dissolved Boron and Silicon During Estuarine Mixing of Sea and River Waters,
W76-09725 2K

Experimental Effect of Boron on Anticarious Action of Fluorine in Drinking Water, (In Russian),
W76-09885 5F

BOTTOM SAMPLING
Effects of Discharge from a Dredge Spoils Site on Carroll Island, Maryland,
W76-09647 5C

BOTTOM SEDIMENTS
Interstitial Protozoa and Algae of Louisiana Salt Marshes,
W76-09593 5C

Marine Soil Pollution and Self-Purification, (In Russian),
W76-09789 5A

Bottom Deposits of the Kuban Deltaic Limans, (In Russian),
W76-09935 2L

BOUGHTON MODEL
Parameter Optimization for Watershed Models,
W76-09853 2A

BOUNDARY CONDITIONS
Some Hard Lessons in Numerical Hydraulics,
W76-09952 8B

BRACKISH WATER
New Technologies in Water Purification and Their Application to Arid Lands,
W76-09481 3A

Chemistry of Dissolved Inorganic Carbon in Estuarine and Coastal Brackish Waters,
W76-09597 2L

Method and Apparatus for Converting Saline Water to Fresh Water,
W76-09871 3A

Method and Apparatus for the Conversion of an Aqueous Scale-Formed Liquid,
W76-09872 3A

BRAIDING
Modeling of Meandering and Braiding in Rivers,
W76-09974 2J

BRAZIL (BAY OF GUANABARA)
Balanidae as Pollution Indicators in the Bay of Guanabara, (In Portuguese),
W76-09823 5A

BREAKING WAVES
Probability Distributions of Breaking Wave Heights Emphasizing the Utilization of the Jonswap Spectrum,
W76-09721 2L

BREAKWATERS
Concept Analysis: Offshore Breakwater-Oil Storage System,
W76-09904 8A

BRYOPHYTIC VEGETATION
The Aquatic and Subaquatic Bryophytic Vegetation of the Belgian Part of the River Sambre, Related to Ecological Conditions and Water Pollution, (In French),
W76-09986 5C

BUDGETING
Cost of Producing Crops in the Irrigated Southwest, Part II: New Mexico,
W76-09475 3F

BULGARIA (OGOSTA RIVER)
Pollution Influence on the Infusorial Fauna (Protozoa, Ciliata) of Bulgarian Rivers II. The Ogosta River and its Effluents,
W76-09714 5A

BUNGER VALVES
Howell Bunger Valves as Irrigation Outlets,
W76-09615 3F

CADMIUM
Environmental Pollution by Cadmium and Zinc Discharged from a Braun Tube Factory, (In Japanese)
W76-09405 5B

CALCIUM HYPOCHLORITE
On the Extermination of Polyclads: Calcium Hypochlorite (CaOC12) Treatment in the Period of High Water Temperature, (In Korean),
W76-09801 5C

CALIFORNIA
A Three-Dimensional Galerkin Finite Element Solution of Flow Through Multiaquifers in Sutter Basin, California,
W76-09562 2F

Contribution of Salts to the Water Potential of Woody Plants,
W76-09691 3C

Investment Sequencing, Allocation, and Learning in the Design of Water Resources Systems: An Empirical Application,
W76-09846 6A

Development of a Prototype Airborne Oil Surveillance System, Final Report,
W76-09898 5A

A Post Construction Survey of Several Manmade Islands Off the Coast of California,
W76-09911 2L

Use of Mathematical Models in the Palo Alto Marshland Rehabilitation Project,
W76-09949 8B

Forecasts for the Sacremento River System,
W76-09967 2E

Results of Salinity Tests on the San Francisco Bay-Delta Hydraulic Model,
W76-09978 2L

CANADA
Observations of the California Undercurrent Off Washington and Vancouver Island,
W76-09584 2L

Operational Model for Predicting the Movement of Oil in Canadian Navigable Waters,
W76-09908 5B

An Environmental Research Program for Drilling in the Canadian Beaufort Sea,
W76-09912 5G

CANALS
Irrigation Systems in Taiwan: Management of a Decentralized Public Enterprise,
W76-09848 3F

Application of Water Quality Models to Finger Fill Canals,
W76-09981 5B

CANOPY
Micro-Climate Effects on Water Use Efficiency by Plants in an Arid Climate,
W76-09480 3B

CAPACITY EXPANSION
On the Capacity-Expansion of Desalination Plants and Storage Tanks,
W76-09618 3A

CAPTAN
Substitute Chemical Program - Initial Scientific and Minieconomic Review of Captan.
W76-09651 5C

CAPTAN METABOLITES
Substitute Chemical Program - Initial Scientific and Minieconomic Review of Captan.
W76-09651 5C

CARBOHYDRATE OXIDIZING MICROORGANISMS
Marine Soil Pollution and Self-Purification, (In Russian),
W76-09789 5A

CARBON
Chemistry of Dissolved Inorganic Carbon in Estuarine and Coastal Brackish Waters,
W76-09597 2L

CARBONATE ROCKS
Role of Carbonate Rocks in Modifying Flood Flow Behavior,
W76-09784 2A

CARBONATES
Using a CHN Analyzer to Reduce Carbonate Interference in Particulate Organic Carbon Analyses,
W76-09940 5A

CARBONIZATION EFFLUENTS
Microbial Aspects of Carbonisation Effluent Treatment,
W76-09712 5D

CARDIUM
Bottom Deposits of the Kuban Deltaic Limans, (In Russian),
W76-09935 2L

CARIES PREVENTION
Experimental Effect of Boron on Anticarious Action of Fluorine in Drinking Water, (In Russian),
W76-09885 5F

CENTRIFUGATION
Laboratory Centrifuge Saves Time and Money,
W76-09704 5D

CERATIUM-HIRUNDINELLA
The Primary Production of Phytoplankton in Lake Balaton April-September 1972,
W76-09992 5C

CEREAL CROPS
The Leaching Behavior of Different Nitrogen Sources in Lysimeter Experiments, (In German),
W76-09793 2G

CERIUM
Determination of Fluorine in Drinking Water with a Cerium(III)- or Lanthanum Alizarin Complex, (In Russian),
W76-09796 5A

CESIUM-137
Concentration of Cesium-137 in Aquatic Organisms, Water and Bottom Deposits of Water Bodies with a Different Mineral Compositions of the Water, (In Russian),
W76-09410 5C

CHANNEL BEHAVIOR
The Influence of Urbanization on Stream Channel Behavior,
W76-09744 4C

CHANNEL FLOW
The Influence of Urbanization on Stream Channel Behavior,
W76-09744 4C

CHARALES
The Vegetation of the 'Lukniany Lake' Nature Reserve in the Mazurian Lake District,(In Polish),
W76-09990 5C

CHEMCONTROL
Water Conservation in Arid-Zone Soils,
W76-09478 3B

Recent Trends in Weed Control in Freshwater,
W76-09921 4A

CHEMICAL ANALYSIS
Hydrologic and Chemical Analysis of the Principal Piedmontese Tributaries of Lago Maggiore in Relation to its Trophic Modifications, (In Italian),
W76-09576 5C

Water Chemistry of the St. Lawrence Estuary,
W76-09581 5A

Geochemical and Isotopic Analyses of Waters Associated with the Edwards Limestone Aquifer, Central Texas,
W76-09836 2K

CHEMICAL DEGRADATION
Radiation Chemical Destruction of Phenol in Oxygenated Aqueous Solutions,
W76-09530 5D

Effects of Gamma Radiation from Co60 on Dilute Aqueous Solutions of Linear Alkyl Sulfonate Surfactants and other Organic Pollutants,
W76-09531 5D

Effects of Gamma Irradiation on the Degradation of Dyes,
W76-09532 5D

Possible use of High-Level Radiation for the Degradation of Some Substances Present in Urban and Industrial Waters,
W76-09533 5D

CHEMICAL PRECIPITATION
Removal of Phosphate from Waste Water,
W76-09458 5D

CHEMICAL TREATMENT
Phosphate Removal--Tackling Eutrophication from the Other Side,
W76-09436 5D

CHEMICAL WASTES
Furnace for Thermal Treatment of Liquid Industrial Waste Waters Containing Toxic Organic Impurities (Pech' Dlya Termicheskogo Obezvrezhivaniya Zhidkikh Promyshlennykh Stokov S Toksicheskimi Organicheskimi Primesyami),
W76-09875 5D

CHEMICALS
Interaction Mechanisms of Radioactive, Chemical and Thermal Releases from the Nuclear Industry, Methodology for Considering Co-Operative Effects,
W76-09491 5C

Methods for Measurement of Biodegradability of Chemical Compounds,
W76-09599 5C

ERNOZEMS
Studies on the Relationships Between Moisture and Suction in Some Soils of the Tisa Plain, (In Rumanian),
W76-10000 2G

ESAPEAKE BAY
Research and Investigation of Geology, Mineral, and Water Resources of Maryland.
W76-09565 4A

Maryland Chesapeake Bay Beaches - General Distribution and Classification,
W76-09568 2L

Visual Observation of the Suspended Sediments and Nearshore Ice Signatures in Chesapeake Bay,
W76-09571 2L

Modeling the Chesapeake Bay and Tributaries: A Synopsis,
W76-09587 2L

Effects of Discharge from a Dredge Spoils Site in Carroll Island, Maryland,
W76-09647 5C

Microbial Degradation of Model Petroleum at Low Temperatures,
W76-09648 5C

Modeling of Three-Dimensional Flows in Estuaries,
W76-09977 2L

ISELING
Crop Response to Chiseling and Irrigation in Soils with a Compact A2 Horizon,
W76-09985 3F

LORINATION
Biological Effects of Simulated Discharge Plume Entrainment at Indianpoint Nuclear Power Station, Hudson River Estuary, USA,
W76-09497 5C

LORINE
Effluent Detention Ponds Dechlorinate Wastewater,
W76-09678 5D

LORINE ANALYZER
Effluent Detention Ponds Dechlorinate Wastewater,
W76-09678 5D

LOROPHYLL
Primary Production in the Frozen Lake Balaton,
W76-09991 5C

LOROPHYTA
An Observation of Water Quality and Red Water in Still Water Fish Ponds, (In Korean),
W76-09799 5C

N ANALYZER
Using a CHN Analyzer to Reduce Carbonate Interference in Particulate Organic Carbon Analyses,
W76-09940 5A

OLERA VILRIOS
Ecology of Cholera Vibrios, (In Russian),
W76-09409 5C

ROMATOGRAPHY
Presence and Some Properties of Bacteria of the Family Pseudomonadaceae in the River Danube, (In German),
W76-09792 5A

CITIES
The Distribution of Heavy Rainfall in a Major Urban Area,
W76-09734 2B

CLAMS
Pathology of Acute Poisoning with the Insecticide Sevin in the Bent-Nosed Clam, Macoma Nasuta,
W76-09649 5C

CLARIFIER TANKS
Sludge Removal System,
W76-09416 5D

CLAY-POLYMER SLUDGE
Van Clarifies Sludge Options,
W76-09438 5F

CLAYS
Volume Changes in Swelling Clays,
W76-09881 2G

CLEANING
Sewer Inspection: Checking it Out,
W76-09460 8G

CLEAR-CUTTING
Effects of Management Practices on Water Quality and Quantity: Penn State Experimental Watersheds,
W76-09463 4D

Forest Management Practices as Related to Nutrient Leaching and Water Quality,
W76-09471 4C

CLEAR LAKE (IOWA)
Calculation of Water Temperatures in Clear Lake, Iowa,
W76-09879 5B

CLIMATES
A Model for the Thermodynamic Growth of Sea Ice in Numerical Investigations of Climate,
W76-09722 2C

CLUSTER ANALYSIS
Role of Carbonate Rocks in Modifying Flood Flow Behavior,
W76-09784 2A

COAGULATION
Purification of Waste Water By Polymer Exchangers (Jatevesien puhdistaminen polymeerivaihtajilla),
W76-09675 5D

COAL MINES
Water-Resources Investigations of the U.S. Geological Survey in the Major Coal and Oil Shale Areas of Wyoming, 1975-76,
W76-09833 4A

COASTAL ENGINEERING
Energy Dissipation on a Rough Slope,
W76-09582 8B

Transverse Forces on Vertical Cylinders in Waves,
W76-09583 8B

COASTAL MARSHES
Linear Distribution of the High Marsh Vegetation Communities of the Lower Eastern Shore and its Geological Significance,
W76-09570 2L

COASTAL STRUCTURES
Energy Dissipation on a Rough Slope,
W76-09582 8B

Transverse Forces on Vertical Cylinders in Waves,
W76-09583 8B

COASTS
The Relationship of the Nearshore Longshore Bar and Sand Waves at Ocean City, Maryland,
W76-09569 2L

Coastal Water Research Project. Annual Report for the Year Ended 30 June 1975,
W76-09899 5B

COBALT-60
Effects of Gamma Radiation from Co60 on Dilute Aqueous Solutions of Linear Alkyl Sulfonate Surfactants and other Organic Pollutants,
W76-09531 5D

Fission Product Gamma-Ray Sources as an Alternative to Cobalt-60 Sources for Sewage Sludge Sterilization,
W76-09541 5D

Dosimetry at a High-Activity Co60 Waste Treatment Facility,
W76-09547 5D

COLD REGIONS
Oil in the Arctic,
W76-09902 5C

COLIFORMS
The Microbiological Pollution of North Sea and English Channel Shore, (In French),
W76-09657 5C

Steroids in Effluents,
W76-09696 5A

Hygienic Assessment of Changes in Mineral Water Properties During its Treatment for Use in Internal Balneotherapeutic Procedures, (In Russian),
W76-09795 5C

The Distribution of Coliforms in Fresh Water, (In Japanese),
W76-09934 5C

COLLOIDS
Purification of Waste Water By Polymer Exchangers (Jatevesien puhdistaminen polymeerivaihtajilla),
W76-09675 5D

COLORADO
Computer Estimates of Natural Recharge from Soil Moisture Data - High Plains of Colorado,
W76-09761 2F

Appraisal of Water Resources of Northwestern El Paso County, Colorado,
W76-09828 2E

COLORIMETRY
Determination of Tetramethylthiuram Disulfide (TMTD) in Water and Air by Colimetry, (In Russian),
W76-09590 5A

COLUMBIA RIVER
Cycling of Fe55 and Zn65 in Columbia River Carp Following Reactor Shutdown,
W76-09508 5C

COMBINED EFFECTS (POLLUTANTS)
Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment,
W76-09490 5C

COMBINED SEWERS
Give Stormwater Pollutants the Spin,
W76-09461 5D

An Application of the Storm Water Management Model,
W76-09738 5D

Is the Separation of Sewers Desirable,
W76-09739 5D

Combined Sewage Overflows - Frequency, Environmental Effects, and a Corrective Program,
W76-09741 5D

COMBINED TREATMENT
Apparatus for Treating Industrial and Domestic Waste Waters,
W76-09429 5D

COMMERCIAL FISH
The Mercury Content of Industrial Fish Products: Its Relative Variation with the Treatment (Cooking in Salt Water, Pickling and Fish Production), (In Spanish),
W76-09802 5C

COMPUTER ESTIMATES
Computer Estimates of Natural Recharge from Soil Moisture Data - High Plains of Colorado,
W76-09761 2F

COMPUTER MODELS
ILLUDAS - The Illinois Urban Drainage Area Simulator,
W76-09735 2E

Hydrologic Forecasting for the Ohio River Waterway,
W76-09944 2E

Anisotropic Sand Transport in Tidal Inlets,
W76-09955 2L

COMPUTER PROGRAMS
Optimal Activated Sludge Design Under Uncertainty,
W76-09628 5D

A Combined Model for Operating Irrigated Agricultural Systems Under Uncertainties,
W76-09634 3F

Proposed Revision to the Modified Einstein Method of Computing Total Sediment Discharge,
W76-09842 2J

Operational Model for Predicting the Movement of Oil in Canadian Navigable Waters,
W76-09908 5B

CONCEPTUAL MODELS
Conceptual Hydrological Model for an Averaged-Sized Catchment Area, I. Concepts and Relationships,
W76-09579 2A

CONDENSATION
Apparatus and Method for Recovering Pure Water from Natural Sources and Industrial Polluted Waste Sources,
W76-09867 5G

CONDENSERS
Operation of Hydrogenerator as Synchronous Condensor,
W76-09637 8C

CONFERENCES
Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment,
W76-09490 5C

Radiation for a Clean Environment.
W76-09512 5D

National Conference of District Chiefs, Albuquerque, New Mexico, September 28-October 3, 1975--Proceedings,
W76-09838 2A

CONFINED WATER
Method and Composition for Preventing Water Contaminated with Industrial Waste from Seeping Through Soil Containing Said Water,
W76-09858 5G

CONNECTICUT
A Floodplain Management Framework with Structural and Non-Structural Measures,
W76-09754 6F

CONSTRUCTION
Construction Planning of a Hydro Power Station,
W76-09616 8C

Erosion Control During Pipeline Construction,
W76-09743 5G

Storm-Period Variables Affecting Sediment Transport from Urban Construction Areas,
W76-09840 2J

Urban-Area Sediment Yield--Effects of Construction-Site Conditions and Sediment-Control Methods,
W76-09841 4D

CONSTRUCTION MATERIALS
Value Engineered Sewage Plant Moves Fast,
W76-09672 5D

CONTACT STABILIZATION
Technique Alternatives for a Package Stabilization Plant,
W76-09705 5D

CONTAINER FACILITIES
Specifications for Container Facilities by Simulation,
W76-09943 6A

CONTROL
Cost Effectiveness of Release Prevention Controls for Tritium and Krypton-85,
W76-09506 5G

Monitoring and Automatic Filter Control of the Dreis-Tiefenback Treatment Plant (Betriebsueberwachung und Automatische Filtersteuerung der Aufbereitungsanlage Dreis-Tiefenbach),
W76-09679 5F

CONVEYANCE STRUCTURES
Irrigation Vehicle,
W76-09869 3F

COOLING PONDS
Effect of Heated Water Discharge of Thermal and Nuclear Power Plants on Invertebrates of Cooling Ponds, (In Russian),
W76-09811 5C

COOLING TOWERS
Water Use Policies and Power Plant Economics,
W76-09776 5G

COOLING WATER
Environmental Responses to Thermal Discharges from the Chesterfield Station, James River, Virginia,
W76-09652 5C

COPEPODS
The Relationship Between Temperature and Duration of Egg Development in Some Epiphytic Cladocera and Copepoda from the River Thames, Reading, with a Discussion of Temperature Functions,
W76-09659 5C

Organic Productivity of Inshore and Offshore Waters of Barbados: A Study of the Island Mass Effect,
W76-09938 5C

Changes in the Population of Cladocera and Copepoda in Three Fishponds of the Dombes (In French),
W76-09995 2

COPROSTANOL
Steroids in Effluents,
W76-09696 5A

CORES
Upward Water Movement in Field Cores,
W76-09726 3I

CORN (FIELD)
Effect of Different Spring Soil Moisture Level on Moisture Stress,
W76-09412 3I

Crop Response to Chiseling and Irrigation i Soils with a Compact A2 Horizon,
W76-09985 3I

CORPS OF ENGINEERS PROJECTS
Hydroelectric Power Potential at Corps of En gineers Projects. Recommendations and Executive Summary,
W76-09764 6I

Hydroelectric Power Potential at Corps of En gineers Projects,
W76-09765 6I

CORROSION
Method and Apparatus for the Conversion o an Aqueous Scale-Formed Liquid,
W76-09872 3A

COST ALLOCATION
The Cost Assignment of the Cooperative Wate Resource Development: A Game Theoretic Approach,
W76-09619 6A

Investment Sequencing, Allocation, and Learning in the Design of Water Resources Systems An Empirical Application,
W76-09846 6A

COST ANALYSIS
Cost of Producing Crops in the Irrigate Southwest, Part II: New Mexico,
W76-09475 3

COST COMPARISONS
Sioux Falls Restores Four Wells with Collecto Pipe,
W76-09510 3

Water Authority Rate Making,
W76-09717 6

A Guide to the Selection of Cost-Effectiv Wastewater Treatment Systems,
W76-09772 5

Wastewater Sludge Utilization and Disposa Costs,
W76-09773 5

Costs of Wastewater Treatment by Land Application,
W76-09774 5D

OST EFFECTIVENESS
The Cost-Effectiveness of Water Resources Systems Considering Inadequate Hydrological Data,
W76-09626 6A

OST MINIMIZATION
On the Capacity-Expansion of Desalination Plants and Storage Tanks,

Landslide Hazard in the United States: A Research Assessment,
W76-09781 6F

OTTON
Planting Pattern, Plant Population, Irrigation, and Insect Interactions in Cotton.
W76-09998 3F

REEKS
Re-Evaluation of the Effects of Man-Made Modifications on Gordon Creek Between 1887 and 1973 and Especially as Regards its Fish Fauna,
W76-09407 4C

ROP PRODUCTION
Cost of Producing Crops in the Irrigated Southwest, Part II: New Mexico,
W76-09475 3F

Dependence of Pasture Grass Yield on Soil Moisture Level, (In Russian),
W76-09930 4A

Crop Response to Chiseling and Irrigation in Soils with a Compact A2 Horizon,
W76-09985 3F

ROP RESPONSE
Crop Response to Chiseling and Irrigation in Soils with a Compact A2 Horizon,
W76-09985 3F

ROP YIELD
Effect of Different Spring Soil Moisture Levels on Moisture Stress,
W76-09412 3F

CROSSLINKED AROMATIC POLYAMIDE MEMBRANES
Reverse Osmosis Process Using Crosslinked Aromatic Polyamide Membranes,
W76-09877 3A

CRUSTACEA
Effects of Discharge from a Dredge Spoils Site on Carroll Island, Maryland,
W76-09647 5C

CRUSTACEANS
Generation Time, Length of Life, Instar Duration and Frequency of Moulting, and their Relationship to Temperature in Eight Species of Cladocera from the River Thames, Reading,
W76-09658 5C

The Relationship Between Temperature and Duration of Egg Development in Some Epiphytic Cladocera and Copepoda from the River Thames, Reading, with a Discussion of Temperature Functions,
W76-09659 5C

Changes in the Population of Cladocera and Copepoda in Three Fishponds of the Dombes, (In French),
W76-09995 2I

CULTIVATED LAND
Cost of Producing Crops in the Irrigated Southwest, Part II: New Mexico,
W76-09475 3F

CURRENTS (WATER)
Finite-Amplitude Baroclinic Disturbances in Downstream Varying Currents,
W76-09560 2L

Velocity Observations in the West Passage of Narragansett Bay: A Partially Mixed Estuary,
W76-09561 2L

CYANIDE
Oscillopolarographic Determination of Cyanide in Waste Electroplating Industrial Effluents,
W76-09822 5A

CYANOPHYTA
Improving Water Quality by control of Algae: Cellular and Extracellular Blue-Green Algal Polysaccharides,
W76-09760 5G

An Observation of Water Quality and Red Water in Still Water Fish Ponds, (In Korean),
W76-09799 5C

CYCLING NUTRIENTS
Forest Management Practices as Related to Nutrient Leaching and Water Quality,
W76-09471 4C

Phosphorus and Nitrogen Cycle on a Transect in Lake Ontario During the International Field Year 1972-1973 (IFYGL),
W76-09594 5C

Materials Budgets of Lake Champlain,
W76-09756 5A

Sedimentation and Phosphorus Balance in Lake Lucerne (Horw Bay) and in the Rotsee, (In German),
W76-09790 5C

CYCLOTELLA-BODANICA
The Primary Production of Phytoplankton in Lake Balaton April-September 1972,
W76-09992 5C

CYTOLOGICAL STUDIES
Effecto De La Temperatura De Aclimatacion Sobre La Proliferacion De Precursores Eritropoyeticos En Carassius Auratus, (The Effect of Acclimation Temperature on Proliferation of Erythropoietic Precursors in Carrassius Auratus and on the Uptake of Tritiated Thymidine in Haematopoietic and Intestinal Tissue),
W76-09509 5C

DAMAGES
A Procedure for Estimating Off-Site Sediment Damage Costs and an Empirical Test,
W76-09632 4A

DAPHNIA
A Screening Bioassay Using Daphnia Pulex for Refinery Wastes Discharged into Freshwater,
W76-09653 5A

The Action of Some Pollutants on the Growth of Daphnia Magna Strauss, (In French),
W76-09937 5C

DAPHNIA PULEX
A Screening Bioassay Using Daphnia Pulex for Refinery Wastes Discharged into Freshwater,
W76-09653 5A

DATA COLLECTIONS
On Long-Term Stability of Zooplankton Composition,
W76-09600 5C

A Water-Land Use Management Model for the Sevier River Basin Phases I and II,
W76-09844 4A

DATA PROCESSING
Evaluation of Mean Square Error Involved in Approximating the Areal Average of a Rainfall Event by a Discrete Summation,
W76-09572 2B

How to Build a Better Bench Sheet,
W76-09701 5D

DATA REQUIREMENTS
Data Requirements for the Optimization of Reservoir Design and Operating Rule Determination,
W76-09622 4A

DECANTING (WASTES)
Sludge Control and Decant System,
W76-09419 5D

DECHLORINATION
Effluent Detention Ponds Dechlorinate Wastewater,
W76-09678 5D

DECISION MAKING
Energy Consumption and Fuel Choice by Residential and Commercial Consumers in the United States,
W76-09609 6A

DECOMPOSING ORGANIC MATTER
The Role of Microflora in the Productivity of a Salmon Breeding Lake, (In Russian),
W76-09818 5C

Biological Production Processes in the Ural River, (In Russian),
W76-09919 5C

DEEP WELLS
Operation and Maintenance of a Deep-Well Water-Level Measurement Device, 'The Iron Horse',
W76-09835 4B

DEEPWATER PORTS
Concept Analysis: Offshore Breakwater-Oil Storage System,
W76-09904 8A

Recommended Procedure for Developing Deepwater Ports Design Criteria,
W76-09907 5G

DEHYDROGENASE ACTIVITY (SLUDGE)
Development of a Measurement Method for the Total Activity Rate of Activated Sludge (Contribution a La Mise Au Point D'une Methode De Mesure Du Taux D'Activite Totale Des Boues Activees),
W76-09695 5D

DELAWARE RIVER
Combined Sewage Overflows - Frequency, Environmental Effects, and a Corrective Program,
W76-09741 5D

DELTAS
Bottom Deposits of the Kuban Deltaic Limans, (In Russian),
W76-09935 2L

River Delta Computer Simulation Model (Simudelt),
W76-09954 2L

Results of Salinity Tests on the San Francisco Bay-Delta Hydraulic Model,
W76-09978 2L

DEMAND
Methdological Issues in the Econometric Estimation of Energy Demand Elasticities,
W76-09607 6A

The Use of Econometrics to Project Energy Demands,
W76-09611 6A

Energy Models and Forecasts: A User's Point of View,
W76-09612 6A

Energy Models and Forecasts: A User's Point of View,

Transformation of Concentrated and Complex
Phosphorus Fertilizers in Modow-Bog Soil with
a High Moisture Content, (In Azerbaijani),
W76-09786 5B

The Leaching Behavior of Different Nitrogen
Sources in Lysimeter Experiments, (In Ger-
man),
W76-09793 2G

FILTER GRATINGS
Inductive Cavitator Keeps Filter Gratings Clear
of Debris,
W76-09677 5D

FILTERS
Apparatus for Treating Industrial and Domestic
Waste Waters,
W76-09429 5D

Development of a Continuous Inclined Sand
Bed Filter,
W76-09668 5D

Inductive Cavitator Keeps Filter Gratings Clear
of Debris,
W76-09677 5D

FILTRATION
Method and Apparatus for Rejuvenating a Bed
of Granular Filter Medium,
W76-09424 5D

Apparatus for Treating Industrial and Domestic
Waste Waters,
W76-09429 5D

Reverse Osmosis -- Can it Replace Distillation,
W76-09667 5D

Development of a Continuous Inclined Sand
Bed Filter,
W76-09668 5D

Inductive Cavitator Keeps Filter Gratings Clear
of Debris,
W76-09677 5D

Monitoring and Automatic Filter Control of the
Dreis-Tiefenback Treatment Plant
(Betriebsueberwachung und Automatische Fil-
tersteuerung der Aufbereitungsanlage Dreis-
Tiefenbach),
W76-09679 5F

Industrial Experience of Sewage Sludge
Processing with Zimpro Installations in the
Netherlands,
W76-09709 5D

Domestic Water Filtration Apparatus,
W76-09862 5F

FINANCING
Financing Pollution Abatement Equipment for
Textiles and Other South Carolina Industries.
W76-09766 5G

Presentation Concerning Pollution Control
Facilities Revenue Bonds,
W76-09767 5G

Role of the Underwriter in Tax Exempt Financ-
ing for Industrial Expansion and Pollution Con-
trol,
W76-09768 5G

The Industrial Revenue Bond for Pollution
Control: One Company's Perspective,
W76-09769 5G

Financing Pollution Control Projects in South
Carolina Using Tax-Exempt Industrial Revenue
Bonds,
W76-09770 5G

The Pollution Control Bond,
W76-09771 5G

FINGER FILL CANALS
Application of Water Quality Models to Finger
Fill Canals,
W76-09981 5B

FINITE ELEMENT ANALYSIS
A Three-Dimensional Galerkin Finite Element
Solution of Flow Through Multiaquifers in
Sutter Basin, California,
W76-09562 2F

FINLAND
Purification of Waste Water By Polymer Exchangers (Jatevesien puhdistaminen polymeerivaihtajilla),
W76-09675 5D

FISH
Re-Evaluation of the Effects of Man-Made Modifications on Gordon Creek Between 1887 and 1973 and Especially as Regards its Fish Fauna,
W76-09407 4C

Experiments on the Culture of the Large Snake-Head Ophicephalus Marulius (Hamilton),
W76-09487 8I

Environmental Quality Research, First Annual Report,
W76-09654 5C

FISH CONTROL AGENTS
Reaction Times of Certain Freshwater Fishes to a Rotenone-Containing Piscicide,
W76-09993 5C

FISH DIETS
Feeding Habits of the Population of Whitefish (Coregonus Lavaretus (L.)) in Haugatjern: A Eutrophic Norwegian Lake,
W76-09882 2H

FISH DISEASES
Pathology of Acute Poisoning with the Insecticide Sevin in the Bent-Nosed Clam, Macoma Nasuta,
W76-09649 5C

FISH FEEDING HABITS
Feeding Habits of the Population of Whitefish (Coregonus Lavaretus (L.)) in Haugatjern: A Eutrophic Norwegian Lake,
W76-09882 2H

FISH FOOD ORGANISMS
Concentration of Cesium-137 in Aquatic Organisms, Water and Bottom Deposits of Water Bodies with a Different Mineral Compositions of the Water, (In Russian),
W76-09410 5C

Feeding Habits of the Population of Whitefish (Coregonus Lavaretus (L.)) in Haugatjern: A Eutrophic Norwegian Lake,
W76-09882 2H

FISH PONDS
An Observation of Water Quality and Red Water in Still Water Fish Ponds, (In Korean),
W76-09799 5C

FISH PRODUCTS
The Mercury Content of Industrial Fish Products: Its Relative Variation with the Treatment (Cooking in Salt Water, Pickling and Fish Production), (In Spanish),
W76-09802 5C

FISH REPRODUCTION
Additional Observations on the Effects of Strip Mining on Small-Stream Fishes in East-Central Kentucky,
W76-09468 5C

Engineering Reclamation, A Most Important Means of Increasing Fish Productivity of Waters, (In Russian),
W76-09800 8I

FISHERIES
An Economist's View of the Oceans,
W76-09617 6E

Engineering Reclamation, A Most Important Means of Increasing Fish Productivity of Waters, (In Russian),
W76-09800 8I

FIXED-BED MODELS
Physical Modeling Techniques Used in River Models,
W76-09972 2E

FJORDS
Water Transport in the Sill Area of Balsfjord North Norway, During Vernal Meltwater Discharge,
W76-09999 2L

FLOCCULATION
Cationic Acrylamide-Styrene Copolymers and Flocculation of Sewage Therewith,
W76-09434 5D

Purification of Waste Water By Polymer Exchangers (Jatevesien puhdistaminen polymeerivaihtajilla),
W76-09675 5D

The Relationship Between Dissimilatory Nitrate Reduction and Oxygen Uptake by Cells of an Alcaligenes Strain in Flocs and in Suspension and by Activated Sludge Flocs,
W76-09686 5D

Increasing the Capacity of Sedimentation Tanks by Means of Sloping Plates,
W76-09706 5D

FLOOD CONTROL
Evaluation of Flood Control Under Changing Conditions,
W76-09630 4A

Flood Problems in Uttar Pradesh,
W76-09640 4A

A Flood Management Model for Urbanizing River Basins,
W76-09737 4C

Management of Flood Control and Drainage in the Urbanizing Zone,
W76-09750 4A

A Linear Programming Model for Use in Guiding Urban Floodplain Management,
W76-09849 6F

FLOOD FLOW
Role of Carbonate Rocks in Modifying Flood Flow Behavior,
W76-09784 2A

FLOOD FREQUENCY
Effect of Sequence Length n on the Choice of Assumed Distribution of Floods,
W76-09851 4A

FLOOD PEAK
Remedial Measures for Urban Flood Peak Reduction,
W76-09736 2E

FLOOD PLAIN CHANGES
A Primer on Floodplain Dynamics,
W76-09831 2E

FLOOD PLAIN ZONING
A Floodplain Management Framework with Structural and Non-Structural Measures,
W76-09754 6F

FLOOD PLAINS
A Primer on Floodplain Dynamics,
W76-09831 2E

A Linear Programming Model for Use in Guid ing Urban Floodplain Management,
W76-09849 6I

FLOOD PROTECTION
A Floodplain Management Framework witl Structural and Non-Structural Measures,
W76-09754 6I

FLOODING
Effects of Flooding and of Irrigation Wate Salinity on Eucalyptus Camaldulensis Dehr From Three Seed Sources,
W76-09664 3(

FLOODS
A Primer on Floodplain Dynamics,
W76-09831 2I

Effect of Sequence Length n on the Choice o Assumed Distribution of Floods,
W76-09851 4A

FLORIDA
Application of Water Quality Models to Finge Fill Canals,
W76-09981 5I

FLOTATION REAGENT BB-2
Hygienic Standardization of Flotation Reager BB-2 and its Components as Industrial Cor taminants of Water Bodies, (In Russian),
W76-09886 5I

FLOW
Use of the Computer Program 'STORM' fo Analysis of the Quantity and Quality of Urba Storm Water Runoff,
W76-09740 5I

Numerical Two-Dimensional Flow Model fo River Systems,
W76-09964 2

Two-Dimensional Model of Flow Toward In takes,
W76-09965 2

Mathematical Model of Flow in a Stream Aquifer System,
W76-09966 2I

Modeling of Three-Dimensional Flows i Estuaries,
W76-09977 2I

FLOW CHARACTERISTICS
Effects of Management Practices on Wate Quality and Quantity: Newark, New Jersey Municipal Watersheds,
W76-09465 4I

Watershed Response to Partial Area Applica tions of Simulated Rainfall,
W76-09467 2A

FLOW CONTROL
Sluice Gates Help Regulate Plant's Hydrauli Flows.
W76-09680 8(

FLOW DURATION
Effects of Management Practices on Wate Quality and Quantity: Penn State Experimental Watersheds,
W76-09463 4I

FLOW MODELS
Numerical Two-Dimensional Flow Model fo River Systems,
W76-09964 2I

Mathematical Model of Flow in a Stream-Aquifer System,
W76-09966 2E

IODIZED BEDS
Waste Treatment Apparatus,
W76-09432 5D

IODINE
Determination of Fluorine in Drinking Water with a Cerium(III)- or Lanthanum Alizarin Complex, (In Russian),
W76-09796 5A

Experimental Effect of Boron on Anticarious Action of Fluorine in Drinking Water, (In Russian),
W76-09885 5F

ALLUVIAL SEDIMENTS
Cenozoic Deposits of Southeastern New Mexico and an Outline of the History of Evaporite Dissolution,
W76-09837 2J

FOOD PLANTS
Comparative Evaluation of Food Plants of the Ararat Cochineal Scale (Porphyrophora Hamelii) (In Russian),
W76-09406 2I

FOOD PROCESSING INDUSTRY
Economic Analysis of Effluent Guidelines: Grain Processing Segment of the Grain Mills Industry,
W76-09775 5G

Economic Analysis of Effluent Guidelines: Apple, Citrus and Potato Processing Segments of the Canned and Preserved Fruits and Vegetable Industry,
W76-09779 5G

FOODS
Use of Sewage Sludge as Fodder,
W76-09554 5D

Determination of Microquantities of Naphthalene in Environmental Objects, (In Russian),
W76-09620 5A

FORECASTING
Energy Modeling and Forecasting.
W76-09602 6A

Energy Projections--Relationship to Policy Issues,
W76-09603 6A

Energy Models and Forecasts: A User's Point of View,
W76-09612 6A

Energy Models and Forecasts: A User's Point of View,
W76-09613 6A

A Review and Analysis of Selected Hydrologic Modeling Concepts,
W76-09718 2E

Relationship of Heavy Rainfall to Soil Erosion in View of its Forecasting, (In Bulgarian),
W76-09807 2J

Forecasts for the Sacremento River System,
W76-09967 2E

FOREST MANAGEMENT
Forest Management Practices as Related to Nutrient Leaching and Water Quality,
W76-09471 4C

Effect of Thinning on the Foliage and Forest Floor Properties of Ponderosa Pine Stands,
W76-09474 4A

Distribution of Ponderosa Pine Forest Densities on the Salt-Verde River Basin,
W76-09477 4A

FOREST SOILS
Effect of Thinning on the Foliage and Forest Floor Properties of Ponderosa Pine Stands,
W76-09474 4A

FORESTS
Distribution of Ponderosa Pine Forest Densities on the Salt-Verde River Basin,
W76-09477 4A

FOSSIL FUELS
Offshore Petroleum and New England - A Study of the Regional Economic Consequences of Potential Offshore Oil and Gas Development,
W76-09893 6B

FRANCE (DOMBES)
Changes in the Population of Cladocera and Copepoda in Three Fishponds of the Dombes, (In French),
W76-09995 2I

FROST
The Modified Fernow Frost Gage,
W76-09880 7B

FUELS
Energy Consumption and Fuel Choice by Residential and Commercial Consumers in the United States,
W76-09609 6A

FULVIC ACIDS
The Qualitative Organic Matter Composition of Some Marshy Soils of Nizhnevelikoretsk Plain, (In Russian),
W76-09888 2G

FURROW IRRIGATION
Efficiency of Irrigation Methods for Strawberries,
W76-09897 3F

GAGES
The Modified Fernow Frost Gage,
W76-09880 7B

GAMMA RAYS
Fission Product Gamma-Ray Sources as an Alternative to Cobalt-60 Sources for Sewage Sludge Sterilization,
W76-09541 5D

GAS CHROMATOGRAPHY
Application of Real-Time Mass Spectrometric Techniques to Environmental Organic Geochemistry. I. Computerized High Resolution Mass Spectrometry and Gas Chromatography-Low Resolution Mass Spectrometry,
W76-09687 5A

Gas-Liquid Chromatographic Determination of Butyl Acetate, Butanol and Acetone Present Together in Waste Waters, (In Russian),
W76-09929 5A

GASES
Determination, Storage, and Preservation of Low Molecular Weight Hydrocarbon Gases in Aqueous Solution,
W76-09834 2K

Apparatus and Method for Recovering Pure Water from Natural Sources and Industrial Polluted Waste Sources,
W76-09867 5G

GELATINOUS ZOOPLANKTON
Underwater Observations of Gelatinous Zooplankton: Sampling Problems, Feeding Biology, Land Behavior,
W76-09598 5C

GENERATORS
Operation of Hydrogenerator as Synchronous Condensor,
W76-09637 8C

GEOCHEMICAL EXPLORATION
Exploration Rock Geochemistry-Detection of Trace Element Halo at Heath Steele Mines (N. B., Canada) by Discriminant Analysis,
W76-09473 2K

GEOCHEMISTRY
Exploration Rock Geochemistry-Detection of Trace Element Halo at Heath Steele Mines (N. B., Canada) by Discriminant Analysis,
W76-09473 2K

Characterization of Nitrogen Sources Contaminating Shallow Ground Water in an Arid Basin. Las Vegas Area, Nevada,
W76-09762 5B

Geochemical and Isotopic Analyses of Waters Associated with the Edwards Limestone Aquifer, Central Texas,
W76-09836 2K

GEOLOGIC FORMATIONS
Research and Investigation of Geology, Mineral, and Water Resources of Maryland.
W76-09565 4A

Observation of Linear Features in the Maryland Piedmont as Shown on ERTS-1 MSS Imagery and Aircraft Support Photography,
W76-09567 4A

Cenozoic Deposits of Southeastern New Mexico and an Outline of the History of Evaporite Dissolution,
W76-09837 2J

GEOMORPHOLOGY
Movable-Bed River-Models,
W76-09969 2E

GEORGIA
Evaluation of Combined Applications of Ultrafiltration and Complexation Capacity Techniques to Natural Waters,
W76-09690 5A

Legal Approaches to Control Runoff and Sedimentation: A Case Study of Georgia,
W76-09747 4D

GERMANY
Types and Treatment of Sewage Sludges Practice in the Federal Republic of Germany,
W76-09513 5D

The Algal Population of Duemmer Lake in the Years 1970/71, (In German),
W76-09812 5C

GLACIAL DEPOSITS
Gravity Geophysics for Groundwater Exploration in Glaciated Areas,
W76-09758 4B

GOLDFISH
Effecto De La Temperatura De Aclimatacion Sobre La Proliferacion De Precursores Eritropoyeticos En Carassius Auratus, (The Effect of Acclimation Temperature on Proliferation of Erythropoietic Precursors in Carrassius Auratus and on the Uptake of Tritiated Thymidine in Haematopoietic and Intestinal Tissue),
W76-09509 5C

GORDON CREEK
Re-Evaluation of the Effects of Man-Made Modifications on Gordon Creek Between 1887 and 1973 and Especially as Regards its Fish Fauna,
W76-09407 4C

GOVERNMENT FINANCE
Secondary Effects of Public Investments in Highways and Sewers.
W76-09778 5G

GRAIN MILLING INDUSTRY
Economic Analysis of Effluent Guidelines: Grain Processing Segment of the Grain Mills Industry,
W76-09775 5G

GRANULAR FILTERS
Method and Apparatus for Rejuvenating a Bed of Granular Filter Medium,
W76-09424 5D

GRASSES
Comparative Evaluation of Food Plants of the Ararat Cochineal Scale (Porphyrophora Hamelii) (In Russian),
W76-09406 2I

Dependence of Pasture Grass Yield on Soil Moisture Level, (In Russian),
W76-09930 4A

GRASSLANDS
On the Ecology of Collembola and Oribatids in a Landsea Transition Zone (Collembola, Insecta-Oribatei, Acari) (In German),
W76-09635 2L

GRAVEL PACK DESIGN
Monitoring Wells,
W76-09558 4B

GRAVIMETRIC ANALYSIS
Laboratory Centrifuge Saves Time and Money,
W76-09704 5D

GRAY-BROWN PODZOLIC SOILS
Investigations on the Erodibility of a Deeply Plowed Gray-Brown Podzolic Soil from Loess on a Slope by Means of Simulated Rain, (In German),
W76-09917 2J

GREAT LAKES
An Underwater Temperature-Depth Data Collection Device,
W76-09727 2H

Verification of Numerical Models of Lake Ontario, III. Longterm Heat Transports,
W76-09783 2H

GREAT PLAINS
Computer Estimates of Natural Recharge from Soil Moisture Data - High Plains of Colorado,
W76-09761 2F

GREECE (ATHENS)
Isolation of Water Vibrios in Greece, (In French),

W76-09848 3F

Irrigation System Pivot Swivel,
W76-09866 3F

Liquid Distribution System for Irrigation and the Like,
W76-09868 3F

Irrigation Vehicle,
W76-09869 3F

Drip Level Irrigation,
W76-09870 3F

IRRIGATIONS
Objectives and Costs of Advanced Treatment Techniques for Sewage,
W76-09449 5D

ISLANDS
Island Barrier Effects on Sea State as Revealed by a Numerical Wave Model and DMSP Satellite Data,
W76-09559 2L

SOLATION
Isolation of Salmonella from Sewage and Surface Waters, (In Russian),
W76-09411 5A

SRAEL
The Over-Exploitation of Groundwater Resources in Dry Regions,
W76-09479 4B

TALY (LAGO MAGGIORE)
Hydrologic and Chemical Analysis of the Principal Piedmontese Tributaries of Lago Maggiore in Relation to its Trophic Modifications, (In Italian),
W76-09576 5C

AMES RIVER (VA)
Environmental Responses to Thermal Discharges from the Chesterfield Station, James River, Virginia,
W76-09652 5C

ANES ISLAND (MD)
Linear Distribution of the High Marsh Vegetation Communities of the Lower Eastern Shore and its Geological Significance,
W76-09570 2L

APAN
Environmental Pollution by Cadmium and Zinc Discharged from a Braun Tube Factory, (In Japanese)
W76-09405 5B

Joint USA/Japan Project on Global Systems Analysis and Simulation (GLOSAS) of Energy, Resources, and Environmental (ERE) Systems,
W76-09610 6A

Operation of Ozone Treatment Apparatus (Ozone shori sochi no unten),
W76-09713 5F

The Distribution of Coliforms in Fresh Water, (In Japanese),
W76-09934 5C

APAN (FUKUYAMA)
The Heavy Metal Concentrations in the Waters Along the Coast of Fukuyama, (In Japanese),
W76-09815 5A

APAN (KANTO VOLCANIC ASH SOIL)
The Softening of the Kanto Volcanic Ash Soil, (In Japanese),
W76-09925 2G

ET PENETRATION
Near-Field Jet Penetration and Reservoir Mixing,
W76-09962 8C

ETS
Particle-Laden Jets with Application to Ocean Dumping,
W76-09959 5B

Near-Field Jet Penetration and Reservoir Mixing,
W76-09962 8C

Physical Model of Discharge in a Two-Layer Stratified Ambient,
W76-09963 8B

UTE
Meteorological Factors and Disease Expressions in Jute,
W76-09931 3F

KANSAS
Variation and Causative Factors of Sediment Yields in the Arkansas River Basin, Kansas,
W76-09839 2J

KARST
Role of Carbonate Rocks in Modifying Flood Flow Behavior,
W76-09784 2A

KENTUCKY RIVER (KENT)
Additional Observations on the Effects of Strip Mining on Small-Stream Fishes in East-Central Kentucky,
W76-09468 5C

KENTUCKY WATERSHED MODEL
Estimating Selected Parameters for the Kentucky Watershed Model from Watershed Characteristics,
W76-09852 2A

KINEMATIC WAVE APPROXIMATION
A Review and Analysis of Selected Hydrologic Modeling Concepts,
W76-09718 2E

KINETICS
The Chemistry of Ozone in the Treatment of Water,
W76-09684 5F

KOREA
An Observation of Water Quality and Red Water in Still Water Fish Ponds, (In Korean),
W76-09799 5C

KRYPTON-85
Cost Effectiveness of Release Prevention Controls for Tritium and Krypton-85,
W76-09506 5G

LABORATORY TESTS
The Role of Bioassays in Environmental Research,
W76-09644 5A

Laboratory Evaluation of the Coulter On-Line Particle Monitor,
W76-09699 5A

How to Build a Better Bench Sheet,
W76-09701 5D

LAGO MARACAIBO ESTUARY (VENEZUELA)
Experience with a Small Scale, Highly Distorted Fixed Bed Model of the Lago Maracaibo Estuary,
W76-09979 2L

LAGOONS
Objectives and Costs of Advanced Treatment Techniques for Sewage,
W76-09449 5D

The Effluent Lagoons Greifswald-Ladebow (Das Abwasserteichsystem Greifswald-Ladebow),
W76-09682 5D

How to Design Aerated Lagoon Systems to Meet 1977 Effluent Standards,
W76-09703 5D

LAKE BAIKAL (USSR)
Rotifer Production in Lake Baikal, (In Russian),
W76-09791 5C

LAKE BASINS
Sedimentation Rates and Sediment Thickness in Lake Champlain,
W76-09759 2J

LAKE BEDS
Sedimentation Rates and Sediment Thickness in Lake Champlain,
W76-09759 2J

LAKE CHAD (CHAD)
Phytoplankton of the Saline Waters of Kanem (Chad): X. Conclusions, (In French),
W76-09596 2H

LAKE CHAMPLAIN
Materials Budgets of Lake Champlain,
W76-09756 5A

Sedimentation Rates and Sediment Thickness in Lake Champlain,
W76-09759 2J

Sediment Properties, Lake Champlain: 1971-1975,
W76-09763 5B

LAKE CONSTANCE (GERMANY)
Myxobacteria of the Myxococcus Group as Indirect Indicators of Fecal Matter in Surface Water: 1. Communication, (In German),
W76-09591 5A

LAKE LUCERNE (SWITZERLAND)
Sedimentation and Phosphorus Balance in Lake Lucerne (Horw Bay) and in the Rotsee, (In German),
W76-09790 5C

LAKE MICHIGAN
An Underwater Temperature-Depth Data Collection Device,
W76-09727 2H

LAKE ONTARIO
Characteristics of Coastal Circulation Affecting the Transport and Dispersion of Material Released from the Nuclear Industry,
W76-09504 5C

Phosphorus and Nitrogen Cycle on a Transect in Lake Ontario During the International Field Year 1972-1973 (IFYGL),
W76-09594 5C

Verification of Numerical Models of Lake Ontario, III. Longterm Heat Transports,
W76-09783 2H

LAKE SEDIMENTS
Concentration of Heavy Metals in Sediments of a Hydroelectric Impoundment,
W76-09755 5A

Sedimentation Rates and Sediment Thickness in Lake Champlain,
W76-09759 2J

Sediment Properties, Lake Champlain: 1971-1975,
W76-09763 5B

Sedimentation and Phosphorus Balance in Lake Lucerne (Horw Bay) and in the Rotsee, (In German),
W76-09790 5C

LAKES
On Long-Term Stability of Zooplankton Composition,
W76-09600 5C

Characteristics of Thionic Bacteria from the Lakes of the Mari ASSR, (In Russian),
W76-09814 5C

LAND APPLICATION
Costs of Wastewater Treatment by Land Application,
W76-09774 5D

LAND MANAGEMENT
Summary of Municipal Watershed Management Surveys in Eastern United States,
W76-09466 4D

Municipal Watershed Management: What are the Opportunities,
W76-09472 4D

LAND USE
Differentiation of Serpentinitic from Non-Serpentinitic Ultramafic Rocks in ERTS-1 MSS Imagery,
W76-09566 4A

Dewatering of Sewage Sludge Viewed as Part of the Purification Process -- Planning Criteria (Klaerschlammentwaesserung als Teil der Gesamten Klaeraufgabe Betrachtet -- Planungskriterien),
W76-09681 5D

Effects of Land Use and River Seepage on Groundwater Quality in Hall County, Nebraska,
W76-09728 5B

A Flood Management Model for Urbanizing River Basins,
W76-09737 4C

Costs of Wastewater Treatment by Land Application,
W76-09774 5D

Secondary Effects of Public Investments in Highways and Sewers.
W76-09778 5G

A Water-Land Use Management Model for the Sevier River Basin Phases I and II,
W76-09844 4A

Land Use Changes and Reservoir Development: An Application of Land Use Information Systems,
W76-09905 4A

LANDSLIDES
Landslide Hazard in the United States: A Research Assessment,
W76-09781 6F

LANTHANUM-ALIZARIN
Determination of Fluorine in Drinking Water with a Cerium(III)- or Lanthanum Alizarin Complex, (In Russian),
W76-09796 5A

LAS VEGAS VALLEY (NEV)
Characterization of Nitrogen Sources Contaminating Shallow Ground Water in an Arid Basin. Las Vegas Area, Nevada,
W76-09762 5B

LEACHATE
Anaerobic Treatment of Leachate with High Sodium Concentrations,
W76-09641 5D

LEACHING
Forest Management Practices as Related to Nutrient Leaching and Water Quality,
W76-09471 4C

The Leaching Behavior of Different Nitrogen Sources in Lysimeter Experiments, (In German),
W76-09793 2G

The Critical Depth of the Level of Soil-Salinizing Ground Waters, (In Russian),
W76-09808 2G

LEAD
Lead Orthophosphates: III. Stabilities of Fluorophyromorphite and Bromopyromorphite at 25 C,
W76-09820 2K

LEAKAGE
A Three-Dimensional Galerkin Finite Element Solution of Flow Through Multiaquifers in Sutter Basin, California,
W76-09562 2F

Theory of Multiple Leaky Aquifers 1. The Integrodifferential and Differential Equations for Small and Large Values of Time,
W76-09563 2F

LEAKY AQUIFERS
Theory of Multiple Leaky Aquifers 1. The Integrodifferential and Differential Equations for Small and Large Values of Time,
W76-09563 2F

LEGAL ASPECTS
Legal Approaches to Control Runoff and Sedimentation: A Case Study of Georgia,
W76-09747 4D

Municipal Storm Water Management Programs,
W76-09751 4A

LENGTH
Effect of Sequence Length n on the Choice of Assumed Distribution of Floods,
W76-09851 4A

LETHAL LIMIT
On the Extermination of Polyclads: Calcium Hypochlorite (CaOC12) Treatment in the Period of High Water Temperature, (In Korean),
W76-09801 5C

LICHENS
Dependence of the Level of Nitrogenase Activity on the Water Content of the Thallus in Peltigera Canina, P. Evansiana, P. Polydactyla, and P. Praetextata,
W76-09916 5A

LIFE CYCLES
Studies of Phytoplankton Ecology in the Bay of Valparaiso: II. Phytoplankton 1970-1971, (In Spanish),
W76-09408 5A

LIGHT
Primary Production in the Frozen Lake Balaton,
W76-09991 5C

LIMANS
Bottom Deposits of the Kuban Deltaic Limans, (In Russian),
W76-09935 2L

LIME
Requirements and Use of Fertilizer, Lime, and Mulch for Vegetating Acid Mine Spoils,
W76-09469 4D

LINEAR ALKYLATE SULFONATES
Effects of Gamma Radiation from Co60 on Dilute Aqueous Solutions of Linear Alkyl Sulfonate Surfactants and other Organic Pollutants,
W76-09531 5D

LINEAR MODELS
Sensitivity of Linear and Nonlinear Surface Runoff Models to Input Errors,
W76-09578 2A

LINEAR PROGRAMMING
Identification of Linear Systems Response by Parametric Programing,
W76-09575 2E

A Combined Model for Operating Irrigated Agricultural Systems Under Uncertainties,
W76-09634 3F

A Linear Programming Model for Use in Guiding Urban Floodplain Management,
W76-09849 6F

LOESS
Total Porosity and Pore Size Distribution in Untilled and Tilled Loess Soils, (In German),
W76-09939 2G

LONGSHORE TRANSPORT
River Delta Computer Simulation Model (Simudelt),
W76-09954 2L

LOUISIANA
Interstitial Protozoa and Algae of Louisiana Salt Marshes,
W76-09593 5C

LOW FLOW
Effects of Management Practices on Water Quality and Quantity: Penn State Experimental Watersheds,
W76-09463 4D

LYSIMETERS
The Leaching Behavior of Different Nitrogen Sources in Lysimeter Experiments, (In German),
W76-09793 2G

MADTOM
Re-Evaluation of the Effects of Man-Made Modifications on Gordon Creek Between 1887 and 1973 and Especially as Regards its Fish Fauna,
W76-09407 4C

MAINTENANCE
Sewer Inspection: Checking it Out,
W76-09460 8G

Sioux Falls Restores Four Wells with Collector Pipe,
W76-09510 3B

MANAGEMENT
An Economist's View of the Oceans,
W76-09617 6E

The Design of Water Quality Management Projects with Inadequate Data,
W76-09623 5G

NEPA and a State's Role in Water Resources Management,
W76-09627 6E

A Water-Land Use Management Model for the Sevier River Basin Phases I and II,
W76-09844 4A

Irrigation Systems in Taiwan: Management of a Decentralized Public Enterprise,
W76-09848 3F

A Linear Programming Model for Use in Guiding Urban Floodplain Management,
W76-09849 6F

Principle of Management of Degenerated Inlets and Estuaries,
W76-09958 8B

ANIFOLD WELL POINT SYSTEM
Field Drainage with Manifold Well Points,
W76-09586 5G

APPING
Research and Investigation of Geology, Mineral, and Water Resources of Maryland.
W76-09565 4A

Airborne Detection and Mapping of Oil Spills, Grand Bahamas,
W76-09891 5A

APS
Reconnaissance Map Showing Relative Amounts of Soil and Bedrock in the Mountainous Part of the Morrison-Evergreen Quadrangles and Adjoining Areas to the West in Jefferson County, Colorado,
W76-09825 7C

Hydrologic Unit Map--1974, State of Alaska,
W76-09826 7C

Hydrologic Unit Map--1974, State of Oregon,
W76-09827 7C

ARINAS
Application of Physical Tidal Models in Harbor and Marina Design,
W76-09984 5B

ARINE ALGAE
An Assessment of Possible Pollution Effects Over a Century of the Benthic Marine Algae of Co. Durham, England,
W76-09595 5C

ARINE ANIMALS
Underwater Observations of Gelatinous Zooplankton: Sampling Problems, Feeding Biology, Land Behavior,
W76-09598 5C

ARINE BACTERIA
Microbial Degradation of Model Petroleum at Low Temperatures,
W76-09648 5C

ARSHES
Use of Mathematical Models in the Palo Alto Marshland Rehabilitation Project,
W76-09949 8B

ARYLAND
Research and Investigation of Geology, Mineral, and Water Resources of Maryland.
W76-09565 4A

Differentiation of Serpentinitic from Non-Serpentinitic Ultramafic Rocks in ERTS-1 MSS Imagery,
W76-09566 4A

Observation of Linear Features in the Maryland Piedmont as Shown on ERTS-1 MSS Imagery and Aircraft Support Photography,
W76-09567 4A

Maryland Chesapeake Bay Beaches - General Distribution and Classification,
W76-09568 2L

The Relationship of the Nearshore Longshore Bar and Sand Waves at Ocean City, Maryland,
W76-09569 2L

Linear Distribution of the High Marsh Vegetation Communities of the Lower Eastern Shore and its Geological Significance,
W76-09570 2L

Effects of Discharge from a Dredge Spoils Site on Carroll Island, Maryland,
W76-09647 5C

Watershed Management and Sediment Control in Montgomery County,
W76-09748 4D

Storm-Period Variables Affecting Sediment Transport from Urban Construction Areas,
W76-09840 2J

Urban-Area Sediment Yield--Effects of Construction-Site Conditions and Sediment-Control Methods,
W76-09841 4D

MASONBORO INLET (NC)
Simulation of Tidal Hydrodynamics - Masonboro Inlet,
W76-09953 8B

Modeling Sediment Movement for Masonboro Inlet,
W76-09956 2L

Masonboro Inlet Fixed-Bed Model Evaluation,
W76-09957 8B

MASS SPECTROSCOPY
Application of Real-Time Mass Spectrometric Techniques to Environmental Organic Geochemistry. I. Computerized High Resolution Mass Spectrometry and Gas Chromatography-Low Resolution Mass Spectrometry,
W76-09687 5A

MASSACHUSETTS BAY
Sampling Network Design for Dispersion Verification,
W76-09961 5B

MATHEMATICAL MODELS
Advantages of Numerical Atmospheric Dispersion Calculations for Estimating Dispersal and Combination Effects of Stack Releases from the Nuclear Industry,
W76-09501 5A

Optimal Ground Water Quality Management: Well Injection of Waste Waters,
W76-09511 5D

Theory of Multiple Leaky Aquifers 1. The Integrodifferential and Differential Equations for Small and Large Values of Time,
W76-09563 2F

Conceptual Hydrological Model for an Averaged-Sized Catchment Area, I. Concepts and Relationships,
W76-09579 2A

Conceptual Hydrological Model for an Average-Sized Catchment Area, II. Estimate of Parameters, Validity of Model, Application,
W76-09580 2A

The Use of Econometrics to Project Energy Demands,
W76-09611 6A

Energy Models and Forecasts: A User's Point of View,
W76-09612 6A

Energy Models and Forecasts: A User's Point of View,
W76-09613 6A

Computer Estimates of Natural Recharge from Soil Moisture Data - High Plains of Colorado,
W76-09761 2F

A Proposed Algorithm for the Solution of the Large-Scale Inverse Problem in Groundwater,
W76-09850 2F

Estimating Selected Parameters for the Kentucky Watershed Model from Watershed Characteristics,
W76-09852 2A

Parameter Optimization for Watershed Models,
W76-09853 2A

Symposium on Modeling Techniques, Volume I.
W76-09941 2A

Some Hard Lessons in Numerical Hydraulics,
W76-09952 8B

Simulation of Tidal Hydrodynamics - Masonboro Inlet,
W76-09953 8B

Systems Modeling of Stratified Fluids,
W76-09976 8B

Hydrodynamic Transport Phenomena in Estuaries and Coastal Waters: Scope of Mathematical Models,
W76-09980 5B

Application of Water Quality Models to Finger Fill Canals,
W76-09981 5B

River and Estuary Modeling with the Siva System,
W76-09982 2A

Hydrodynamic and Material Transport Model for Mobile Bay, Alabama,
W76-09983 5B

MATHEMATICAL STUDIES
The Concentration of Dissolved Solids and River Flow,
W76-09577 5B

MAURITANIA (BAY DU LEVRIER)
Quantitative Aspect of the Phytoplankton of the Bay Du Levrier (Mauritania), (In French),
W76-09987 5C

MEADOWS
Phytomass Dynamics of Aboveground and Underground Organs of Meadow Steppe Plants, (In Russian),
W76-09817 2I

MEAN ANNUAL FOOD
Role of Carbonate Rocks in Modifying Flood Flow Behavior,
W76-09784 2A

MEANDERS
Modeling of Meandering and Braiding in Rivers,
W76-09974 2J

MEASUREMENT
Methods for Measurement of Biodegradability of Chemical Compounds,
W76-09599 5C

MEASUREMENT

Biodegradability and Process for Biological Purification of Waste Water (La Biodegradabilite et Les Procedes D'Epuration Biologique Des Effluents),
W76-09693 5D

Development of a Measurement Method for the Total Activity Rate of Activated Sludge (Contribution a La Mise Au Point D'une Methode De Mesure Du Taux D'Activite Totale Des Boues Activees),
W76-09695 5D

Laboratory Evaluation of the Coulter On-Line Particle Monitor,
W76-09699 5A

Sensors for Continuous Monitoring of Toxic Ions, Nutrients, and Dissolved Gases in Water,
W76-09906 5A

MELT WATER

Water Transport in the Sill Area of Balsfjord North Norway, During Vernal Meltwater Discharge,
W76-09999 2L

MELTING

Water Transport in the Sill Area of Balsfjord North Norway, During Vernal Meltwater Discharge,
W76-09999 2L

MEMBRANE-FILTER METHOD

Myxobacteria of the Myxococcus Group as Indirect Indicators of Fecal Matter in Surface Water: 1. Communication, (In German),
W76-09591 5A

MEMBRANE PROCESSES

Evaluation of Combined Applications of Ultrafiltration and Complexation Capacity Techniques to Natural Waters,
W76-09690 5A

Membrane Support-Plates and Fluid Separating Apparatus in which They are Present,
W76-09857 5D

MEMBRANES

Supported Semi-Permeable Membranes,
W76-09863 3A

Semipermeable Membrane and Process for the Preparation Thereof,
W76-09864 3A

Reverse Osmosis Process Using Crosslinked Aromatic Polyamide Membranes,
W76-09877 3A

MERCURY

The Mercury Content of Industrial Fish Products: Its Relative Variation with the Treatment (Cooking in Salt Water, Pickling and Fish Production), (In Spanish),
W76-09802 5C

Metabolic Cycles for Toxic Elements in Aqueous Systems,
W76-09933 5C

MESOTROPHY

The Role of Microflora in the Productivity of a Salmon Breeding Lake, (In Russian),
W76-09818 5C

METABOLISM

Studies on the Metabolism of a Sulfur-Oxidizing Bacterium. VII. Purification and Characterization of Soluble Components Indispensables for Sulfur Oxidation by Thiobacillus Thiooxidans,
W76-09592 5C

Environmental Quality Research, First Annual Report,
W76-09654 5C

Metabolic Cycles for Toxic Elements in Aqueous Systems,
W76-09933 5C

METAGAME THEORY

Metagame Theory and its Applications to Water Resources,
W76-09847 6A

METALS

Sensors for Continuous Monitoring of Toxic Ions, Nutrients, and Dissolved Gases in Water,
W76-09906 5A

METHANE

Microbial Reactions in Facultative Oxidation Ponds -- I. The Anaerobic Nature of Oxidation Pond Sediments,
W76-09435 5D

Sludge Heat Treatment: Operation and Management,
W76-09708 5D

METHODOLOGY

Energy Modeling and Forecasting.
W76-09602 6A

Methdological Issues in the Econometric Estimation of Energy Demand Elasticities,
W76-09607 6A

Aqueduct Optimization with Intermediate Storage,
W76-09636 4A

A Screening Bioassay Using Daphnia Pulex for Refinery Wastes Discharged into Freshwater,
W76-09653 5A

Ten Years of Experience with Automatic Pumping-Sediment Samplers,
W76-09843 7B

The Coanda Effect Oil/Water Separator: A Development Study,
W76-09890 5G

Determining the Concentration of Oil in Water Samples by Infrared Spectrophotometry. Phase II. Interlaboratory Study. Volume II,
W76-09900 5A

Determining the Concentration of Oil in Water Samples by Infrared Spectrophotometry. Phase II. Interlaboratory Study. Volume III,
W76-09901 5A

MICROBIAL DEGRADATION

Microbial Degradation of Model Petroleum at Low Temperatures,
W76-09648 5C

The Role of Microflora in the Productivity of a Salmon Breeding Lake, (In Russian),
W76-09818 5C

Effects of Petroleum Pollutants on Arctic Microbial Populations,
W76-09909 5C

MICROBIAL REACTIONS

Microbial Reactions in Facultative Oxidation Ponds -- I. The Anaerobic Nature of Oxidation Pond Sediments,
W76-09435 5D

MICROCLIMATOLOGY

Micro-Climate Effects on Water Use Efficiency by Plants in an Arid Climate,
W76-09480 3B

MICROCYSTIS-AERUGINOSA

Induced Change of Nitrate Reductase Activity in Microcystis Aeruginosa Kutz. Emend. Elenk, (In Russian),
W76-09816 5C

MICROORGANISMS

Comparative Evaluation of Food Plants of the Ararat Cochineal Scale (Porphyrophora Hamelii) (In Russian),
W76-09406 2I

Microbial Aspects of Carbonisation Effluent Treatment,
W76-09712 5D

Pollution Influence on the Infusorial Fauna (Protozoa, Ciliata) of Bulgarian Rivers II. The Ogosta River and its Effluents,
W76-09714 5A

Marine Soil Pollution and Self-Purification, (In Russian),
W76-09789 5A

Iron-Manganese Microorganisms Studied by Overgrowing Technique, (In Russian),
W76-09813 5A

The Hygienic Quality of the Water in a Growing-Finishing Piggery, (In Romanian),
W76-09883 5B

MICROSCOPY

Iron-Manganese Microorganisms Studied by Overgrowing Technique, (In Russian),
W76-09813 5A

MIDDLE EAST

The Desert War on Pollution,
W76-09711 5D

MIDGES

Insect Growth Regulators for the Control of Aquatic Midges,
W76-09997 5G

MINE WASTES

Changes in Water Chemistry Resulting from Surface-Mining of Coal on Four West Virginia Watersheds,
W76-09470 4C

Concentration of Heavy Metals in Sediments of a Hydroelectric Impoundment,
W76-09755 5A

MINERAL ANALYSIS

Water Chemistry of the St. Lawrence Estuary,
W76-09581 5A

MINERAL WATER

Hygienic Assessment of Changes in Mineral Water Properties During its Treatment for Use in Internal Balneotherapeutic Procedures, (In Russian),
W76-09795 5C

MINERALOGY

Concentration of Cesium-137 in Aquatic Organisms, Water and Bottom Deposits of Water Bodies with a Different Mineral Compositions of the Water, (In Russian),
W76-09410 5C

MINEROLOGY
Exploration Rock Geochemistry-Detection of Trace Element Halo at Heath Steele Mines (N. B., Canada) by Discriminant Analysis,
W76-09473 2K

MINING
Environmental Impact Study of Offshore Sand and Gravel Mining,
W76-09910 6G

MINNESOTA
The Contribution of a Water Information System for Environmental Planning in Minnesota,
W76-09753 6G

MINNOWS
Substitute Chemical Program - Initial Scientific and Minieconomic Review of Captan.
W76-09651 5C

MISSISSIPPI RIVER
Mathematical Modeling of Alluvial Channels,
W76-09968 8B

MISSOURI RIVER
Longitudinal Dispersion Coefficients for Streams,
W76-09589 5B

Undistorted Movable-Bed Model Study for a River and Power Plant Intake System,
W76-09971 8B

MIXED-LAYER DEPTHS
Diagnostic Model Study of Mixed-Layer Depths in the Summer North Pacific,
W76-09719 2L

MOBILE BAY (ALA)
Hydrodynamic and Material Transport Model for Mobile Bay, Alabama,
W76-09983 5B

MODEL STUDIES
Advantages of Numerical Atmospheric Dispersion Calculations for Estimating Dispersal and Combination Effects of Stack Releases from the Nuclear Industry,
W76-09501 5A

Discussion of Possible Effects Due to Mixing of Radioactive and Thermal Releases to the Atmosphere from Nuclear Power Plants,
W76-09502 5A

A Site Study of the Multiple Effects of Thermal Releases on the Aquatic Life in an Estuarine Area,
W76-09505 5C

Hydrologic Systems Analysis Model for Generating Runoff Time Series (Hidrologiai) Rendszervizsgalati Modell Vizhozamidoser Eloallitasara (II. RESZ),

Energy Consumption and Fuel Choice by Residential and Commercial Consumers in the United States,
W76-09609 6A

The Design of Water Quality Management Projects with Inadequate Data,
W76-09623 5G

Ecosystem Modeling,
W76-09645 5C

A Review and Analysis of Selected Hydrologic Modeling Concepts,
W76-09718 2E

Diagnostic Model Study of Mixed-Layer Depths in the Summer North Pacific,
W76-09719 2L

Probability Distributions of Breaking Wave Heights Emphasizing the Utilization of the Jonswap Spectrum,
W76-09721 2L

A Model for the Thermodynamic Growth of Sea Ice in Numerical Investigations of Climate,
W76-09722 2C

On Entrainment and Diffusion in a Gulf of Mexico Anticyclonic Ring,
W76-09723 2L

The Wind Drift and Wave Breaking,
W76-09724 2L

Upward Water Movement in Field Cores,
W76-09726 3F

ILLUDAS - The Illinois Urban Drainage Area Simulator,
W76-09735 2E

Remedial Measures for Urban Flood Peak Reduction,
W76-09736 2E

A Flood Management Model for Urbanizing River Basins,
W76-09737 4C

An Application of the Storm Water Management Model,
W76-09738 5D

Use of the Computer Program 'STORM' for Analysis of the Quantity and Quality of Urban Storm Water Runoff,
W76-09740 5B

Physical and Economic Aspects Associated with Runoff from Urban Growth: A Methodological Approach,
W76-09749 4C

Verification of Numerical Models of Lake Ontario, III. Longterm Heat Transports,
W76-09783 2H

Regression Analysis and Parameter Identification,
W76-09824 7A

A Proposed Algorithm for the Solution of the Large-Scale Inverse Problem in Groundwater,
W76-09850 2F

Symposium on Modeling Techniques, Volume I.
W76-09941 2A

St. Lawrence Seaway: A New Goal of Year-Round Navigation,
W76-09942 2C

Specifications for Container Facilities by Simulation,
W76-09943 6A

Hybrid-Element Method for Water Waves,
W76-09945 8B

Large Wave Channel for 'Full Scale-Modeling' of Wave Dynamics in Surf Zones,
W76-09946 8B

Wave Motions in an Offshore Harbor,
W76-09947 8B

Modeling of Wind-Waves with Jonswap Spectra,
W76-09948 8B

Use of Mathematical Models in the Palo Alto Marshland Rehabilitation Project,
W76-09949 8B

Estuarine Ecologic Simulations,
W76-09950 2L

Organic Sediment Model for Wastewater Outfall,
W76-09951 5B

Some Hard Lessons in Numerical Hydraulics,
W76-09952 8B

Simulation of Tidal Hydrodynamics - Masonboro Inlet,
W76-09953 8B

Modeling Sediment Movement for Masonboro Inlet,
W76-09956 2L

Principle of Management of Degenerated Inlets and Estuaries,
W76-09958 8B

Particle-Laden Jets with Application to Ocean Dumping,
W76-09959 5B

Temperature Predictions for Offshore Power Plants,
W76-09960 5B

Sampling Network Design for Dispersion Verification,
W76-09961 5B

Near-Field Jet Penetration and Reservoir Mixing,
W76-09962 8C

Physical Model of Discharge in a Two-Layer Stratified Ambient,
W76-09963 8B

Numerical Two-Dimensional Flow Model for River Systems,
W76-09964 2E

Two-Dimensional Model of Flow Toward Intakes,
W76-09965 2E

Mathematical Model of Flow in a Stream-Aquifer System,
W76-09966 2E

Forecasts for the Sacremento River System,
W76-09967 2E

Mathematical Modeling of Alluvial Channels,
W76-09968 8B

Movable-Bed River-Models,
W76-09969 2E

Sediment Deposition Model for Tarbela Reservoir,
W76-09970 2J

Undistorted Movable-Bed Model Study for a River and Power Plant Intake System,
W76-09971 8B

Physical Modeling Techniques Used in River Models,
W76-09972 2E

Riverbank Recessions for Power Plant Facilities,
W76-09973 8B

Modeling of Meandering and Braiding in Rivers,
W76-09974 2J

Modeling Sediment Transport in Hydraulic Structures,
W76-09975 2J

Modeling of Three-Dimensional Flows in Estuaries,
W76-09977 2L

Results of Salinity Tests on the San Francisco Bay-Delta Hydraulic Model,
W76-09978 2L

Experience with a Small Scale, Highly Distorted Fixed Bed Model of the Lago Maracaibo Estuary,
W76-09979 2L

Hydrodynamic Transport Phenomena in Estuaries and Coastal Waters: Scope of Mathematical Models,
W76-09980 5B

Application of Water Quality Models to Finger Fill Canals,
W76-09981 5B

River and Estuary Modeling with the Siva System,
W76-09982 2A

Hydrodynamic and Material Transport Model for Mobile Bay, Alabama,
W76-09983 5B

Application of Physical Tidal Models in Harbor and Marina Design,
W76-09984 5B

MODEL TECHNIQUES
Hydrodynamic Transport Phenomena in Estuaries and Coastal Waters: Scope of Mathematical Models,
W76-09980 5B

MOISTURE CONTENT
Transformation of Concentrated and Complex Phosphorus Fertilizers in Modow-Bog Soil with a High Moisture Content, (In Azerbaijani),
W76-09786 5B

MOISTURE TENSION
Effect of Different Spring Soil Moisture Levels on Moisture Stress,
W76-09412 3F

Comparative Study in Measuring Fluid Surface Tension and Fluid Content with the Aid of Electrical Resistance Elements 'In Situ' and in the Laboratory, (In Flemish),
W76-09923 2G

MOLLUSKS
Influence De La Temperature Sur La Contamination D'Especes Marines Par Le Fer-59, (Influence of Temperature on the Contamination of Marine Species by Iron-59),
W76-09494 5C

MONITORING
Monitoring Wells,
W76-09558 4B

Monitoring and Automatic Filter Control of the Dreis-Tiefenback Treatment Plant (Betriebsueberwachung und Automatische Filtersteuerung der Aufbereitungsanlage Dreis-Tiefenbach),
W76-09679 5F

Laboratory Evaluation of the Coulter On-Line Particle Monitor,
W76-09699 5A

Representative Dirty Water Sampling,
W76-09702 5A

Oil Spill and Oil Pollution Reports, November 1974 - February 1975,
W76-09896 5A

Sensors for Continuous Monitoring of Toxic Ions, Nutrients, and Dissolved Gases in Water,
W76-09906 5A

MONTANA
Concentration of Heavy Metals in Sediments of a Hydroelectric Impoundment,
W76-09755 5A

MONTGOMERY COUNTY (MD)
Watershed Management and Sediment Control in Montgomery County,
W76-09748 4D

Urban-Area Sediment Yield--Effects of Construction-Site Conditions and Sediment-Control Methods,
W76-09841 4D

MONTMORILLONITE
Volume Changes in Swelling Clays,
W76-09881 2G

MOUNTAIN CREEK (TEX)
Hydrologic Data for Mountain Creek, Trinity River Basin, Texas, 1974,
W76-09829 7C

MOVABLE-BED MODELS
Physical Modeling Techniques Used in River Models,
W76-09972 2E

MULCHING
Requirements and Use of Fertilizer, Lime, and Mulch for Vegetating Acid Mine Spoils,
W76-09469 4D

MULTIPLE AQUIFERS
Theory of Multiple Leaky Aquifers 1. The Integrodifferential and Differential Equations for Small and Large Values of Time,
W76-09563 2F

MULTIPURPOSE RESERVOIRS
Data Requirements for the Optimization of Reservoir Design and Operating Rule Determination,
W76-09622 4A

MULTIVARIATE ANALYSIS
Role of Carbonate Rocks in Modifying Flood Flow Behavior,
W76-09784 2A

MUNICIPAL WASTES
Method for Eliminating Organic and Inorganic Bound Nitrogen from Domestic and Industrial Waste Water,
W76-09413 5D

MUNICIPAL WATER
Water Authority Rate Making,
W76-09717 6C

MUNICIPAL WATERSHED SURVEYS
Summary of Municipal Watershed Management Surveys in Eastern United States,
W76-09466 4D

MUNICIPAL WATERSHEDS
Effects of Management Practices on Water Quality and Quantity: Baltimore, Maryland, Municipal Watersheds,
W76-09464 4D

Effects of Management Practices on Water Quality and Quantity: Newark, New Jersey, Municipal Watersheds,
W76-09465 4D

Municipal Watershed Management: What are the Opportunities,
W76-09472 4D

MUSKINGUM RIVER (OHIO)
The Concentration of Dissolved Solids and River Flow,
W76-09577 5B

MYXOCOCCUS
Myxobacteria of the Myxococcus Group as Indirect Indicators of Fecal Matter in Surface Water: 1. Communication, (In German),
W76-09591 5A

NAPERVILLE (ILL)
Municipal Storm Water Management Programs,
W76-09751 4A

APHTHALENE
Determination of Microquantities of Naphthalene in Environmental Objects, (In Russian),
W76-09620 5A

ARRAGANSETT BAY (RI)
Velocity Observations in the West Passage of Narragansett Bay: A Partially Mixed Estuary,
W76-09561 2L

ATIONAL ENERGY POLICY
Energy Systems: Modeling and Policy Planning,
W76-09608 6A

ATIONAL ENVIRONMENTAL POLICY ACT
NEPA and a State's Role in Water Resources Management,
W76-09627 6E

ATURAL RECHARGE
Computer Estimates of Natural Recharge from Soil Moisture Data - High Plains of Colorado,
W76-09761 2F

ATURAL RESOURCES
Distribution of Ponderosa Pine Forest Densities on the Salt-Verde River Basin,
W76-09477 4A

AVIGABLE WATERS
Operational Model for Predicting the Movement of Oil in Canadian Navigable Waters,
W76-09908 5B

EBRASKA
Effects of Land Use and River Seepage on Groundwater Quality in Hall County, Nebraska,
W76-09728 5B

EPAL (INDIA)
On The Rainfall and Water Potential of Nepal,
W76-09642 2B

ETHERLANDS
Industrial Experience of Sewage Sludge Processing with Zimpro Installations in the Netherlands,
W76-09709 5D

ETWORK DESIGN
Regression Analysis and Parameter Identification,
W76-09824 7A

Sampling Network Design for Dispersion Verification,
W76-09961 5B

ETWORKS
Evaluation of Mean Square Error Involved in Approximating the Areal Average of a Rainfall Event by a Discrete Summation,
W76-09572 2B

Sampling Network Design for Dispersion Verification,
W76-09961 5B

EVADA
Characterization of Nitrogen Sources Contaminating Shallow Ground Water in an Arid Basin. Las Vegas Area, Nevada,
W76-09762 5B

EW JERSEY
Effects of Management Practices on Water Quality and Quantity: Newark, New Jersey, Municipal Watersheds,
W76-09465 4D

Combined Sewage Overflows - Frequency, Environmental Effects, and a Corrective Program,
W76-09741 5D

NEW MEXICO
Cost of Producing Crops in the Irrigated Southwest, Part II: New Mexico,
W76-09475 3F

Cenozoic Deposits of Southeastern New Mexico and an Outline of the History of Evaporite Dissolution,
W76-09837 2J

NEW YORK BIGHT
Species Composition and Diversity of Polychaetes in the New York Bight,
W76-09650 5C

NEW YORK CITY JAMAICA TREATMENT PLANT
New York Takes Another Giant Step,
W76-09710 5D

NEW ZEALAND
Wastewater Treatment in New Zealand,
W76-09670 5D

NEW ZEALAND (NORTH ISLAND)
The Erodibility of Pumice Soils of the North Island, New Zealand,
W76-09787 4D

NITRATE REDUCTASE ACTIVITY
Induced Change of Nitrate Reductase Activity in Microcystis Aeruginosa Kutz. Emend. Elenk, (In Russian),
W76-09816 5C

NITRATES
Phosphate Removal--Tackling Eutrophication from the Other Side,
W76-09436 5D

Nitrates: What's Happening in Britain,
W76-09451 5D

Forest Management Practices as Related to Nutrient Leaching and Water Quality,
W76-09471 4C

Characterization of Nitrogen Sources Contaminating Shallow Ground Water in an Arid Basin. Las Vegas Area, Nevada,
W76-09762 5B

Induced Change of Nitrate Reductase Activity in Microcystis Aeruginosa Kutz. Emend. Elenk, (In Russian),
W76-09816 5C

The Hygienic Quality of the Water in a Growing-Finishing Piggery, (In Romanian),
W76-09883 5B

NITRIFICATION
Nitrification Studies of Ship Channel Waters,
W76-09453 5D

Possibilities and Limits of Extended Waste Water Purification (Moeglichkeiten und Grenzen der Weitergehanded Abwasserreinigung),
W76-09683 5D

NITRITES
The Hygienic Quality of the Water in a Growing-Finishing Piggery, (In Romanian),
W76-09883 5B

NITROGEN
Method for Eliminating Organic and Inorganic Bound Nitrogen from Domestic and Industrial Waste Water,
W76-09413 5D

Phosphorus and Nitrogen Cycle on a Transect in Lake Ontario During the International Field Year 1972-1973 (IFYGL),
W76-09594 5C

Nitrogen in the Subsurface Environment,
W76-09662 5B

The Leaching Behavior of Different Nitrogen Sources in Lysimeter Experiments, (In German),
W76-09793 2G

The Water Supply System of Soil and Nitrogen Loss with Runoff Waters in Nonchernozem Areas, (In Russian),
W76-09794 2G

NITROGEN COMPOUNDS
Sewage Treatment Process,
W76-09422 5D

Nitrates: What's Happening in Britain,
W76-09451 5D

Nitrogen in the Subsurface Environment,
W76-09662 5B

Sanitary Inspection of Surface Waters Polluted with Aromatic Amino and Nitro-Compounds, (In Russian),
W76-09798 5A

NITROGEN CONTAMINATION
Nitrogen in the Subsurface Environment,
W76-09662 5B

NITROGEN FIXATION
Dependence of the Level of Nitrogenase Activity on the Water Content of the Thallus in Peltigera Canina, P. Evansiana, P. Polydactyla, and P. Praetextata,
W76-09916 5A

NON-LINEAR MODELS
Sensitivity of Linear and Nonlinear Surface Runoff Models to Input Errors,
W76-09578 2A

NON-STRUCTURAL ALTERNATIVES
A Floodplain Management Framework with Structural and Non-Structural Measures,
W76-09754 6F

NONSWELLING SOILS
Stability Analysis of Infiltration,
W76-09588 2G

NORTH AMERICA
Salinity Tolerance of Inland Halophytic Vegetation of North America,
W76-09988 3C

NORTH CAROLINA
Simulation of Tidal Hydrodynamics - Masonboro Inlet,
W76-09953 8B

NORTH SEA
Modeling of Wind-Waves with Jonswap Spectra,
W76-09948 8B

NORWAY (BALSFJORD)
Water Transport in the Sill Area of Balsfjord North Norway, During Vernal Meltwater Discharge,
W76-09999 2L

NORWAY (HAUGATJERN LAKE)
Feeding Habits of the Population of Whitefish (Coregonus Lavaretus (L.)) in Haugatjern: A Eutrophic Norwegian Lake,
W76-09882 2H

NUCLEAR POWERPLANTS
Power Generation in Arizona and Its Environmental Implications,
W76-09485 6D

Wave Motions in an Offshore Harbor,
W76-09947 8B

NUCLEAR TECHNIQUES (HYDROLOGY)
Nuclear Techniques in Hydrological Studies,
W76-09996 2F

NUCLEAR WASTES
Assessing Potential Ocean Pollutants,
W76-09889 5G

NUCLEATION
Synergistic Effects of Atmospheric Releases of Radioactive Gases and SO2 in Inducing Nucleation in the Atmosphere,
W76-09500 5A

NUISANCE ALGAE
Improving Water Quality by control of Algae: Cellular and Extracellular Blue-Green Algal Polysaccharides,
W76-09760 5G

NUMERICAL ANALYSIS
Hybrid-Element Method for Water Waves,
W76-09945 8B

Some Hard Lessons in Numerical Hydraulics,
W76-09952 8B

NUTRIENT
Effect of Thinning on the Foliage and Forest Floor Properties of Ponderosa Pine Stands,
W76-09474 4A

NUTRIENT REMOVAL
Phosphate Removal--Tackling Eutrophication from the Other Side,
W76-09436 5D

NUTRIENT REQUIREMENTS
Sedimentation and Phosphorus Balance in Lake Lucerne (Horw Bay) and in the Rotsee, (In German),
W76-09790 5C

NUTRIENT UPTAKE
A Quantitative Analysis of the Factors Affecting Plant Nutrient Uptake from Some Soils,
W76-09489 2G

NUTRIENTS
Forest Management Practices as Related to Nutrient Leaching and Water Quality,
W76-09471 4C

A Quantitative Analysis of the Factors Affecting Plant Nutrient Uptake from Some Soils
W76-09489 2G

Materials Budgets of Lake Champlain,
W76-09756 5A

Organic Productivity of Inshore and Offshore Waters of Barbados: A Study of the Island Mass Effect,
W76-09938 5C

Quantitative Aspect of the Phytoplankton of the Bay Du Levrier (Mauritania), (In French),
W76-09987 5C

OBSERVATION WELLS
Monitoring Wells,
W76-09558 4B

Report of Water Levels in Selected Observation Wells in Utah--April 1976,
W76-09832 4B

OCEAN CIRCULATION
Temperature Predictions for Offshore Power Plants,
W76-09960 5B

OCEAN CITY (MD)
The Relationship of the Nearshore Longshore Bar and Sand Waves at Ocean City, Maryland,
W76-09569 2L

OCEAN CURRENTS
Finite-Amplitude Baroclinic Disturbances in Downstream Varying Currents,
W76-09560 2L

Observations of the California Undercurrent Off Washington and Vancouver Island,
W76-09584 2L

OCEAN DUMPING
Assessing Potential Ocean Pollutants,
W76-09889 5G

OCEAN WAVES
Island Barrier Effects on Sea State as Revealed by a Numerical Wave Model and DMSP Satellite Data,
W76-09559 2L

Energy Dissipation on a Rough Slope,
W76-09582 8B

Transverse Forces on Vertical Cylinders in Waves,
W76-09583 8B

Probability Distributions of Breaking Wave Heights Emphasizing the Utilization of the Jonswap Spectrum,
W76-09721 2L

Wave Breaking in the Presence of Wind Drift and Swell,
W76-09874 2L

Modeling of Wind-Waves with Jonswap Spectra,
W76-09948 8B

OCEANS
Observations of the California Undercurrent Off Washington and Vancouver Island,
W76-09584 2L

Upwelling Near Samalga Pass,
W76-09585 2L

An Economist's View of the Oceans,
W76-09617 6E

Diagnostic Model Study of Mixed Layer Depths in the Summer North Pacific,
W76-09719 2L

The Role of Vertical Motion in the Heat Budget of the Upper Northeastern Pacific Ocean,
W76-09720 2L

ODOR
Operation of Ozone Treatment Apparatus (Ozone shori sochi no unten),
W76-09713 5F

OFFSHORE PLATFORMS
Concept Analysis: Offshore Breakwater-Oil Storage System,
W76-09904 8A

An Environmental Research Program for Drilling in the Canadian Beaufort Sea,
W76-09912 5G

OFFSHORE POWERPLANTS
Wave Motions in an Offshore Harbor,
W76-09947 8B

Temperature Predictions for Offshore Power Plants,
W76-09960 5B

OFFSHORE TECHNOLOGY
Environmental Impact Study of Offshore Sand and Gravel Mining,
W76-09910 6G

Academic Data-Needs for Environmental Assessments of Offshore Technological Operations,
W76-09914 6G

Coast Guard's Response to Spilled Oil,
W76-09915 5A

OGALLALA FORMATION (NEB)
Effects of Land Use and River Seepage on Groundwater Quality in Hall County, Nebraska,
W76-09728 5B

OHIO
Re-Evaluation of the Effects of Man-Made Modifications on Gordon Creek Between 1887 and 1973 and Especially as Regards its Fish Fauna,
W76-09407 4C

The Concentration of Dissolved Solids and River Flow,
W76-09577 5B

OHIO RIVER
Hydrologic Forecasting for the Ohio River Waterway,
W76-09944 2E

OIL
A Probabilistic Model of the Oil and Gas Discovery Process,
W76-09604 6A

OIL INDUSTRY
Water-Resources Investigations of the U.S. Geological Survey in the Major Coal and Oil Shale Areas of Wyoming, 1975-76,
W76-09833 4A

Combination Providing Safety Berthing, Unloading of Oil, and Conduit Carriage to Refineries on Land, of Large Deep-Sea-Requiring Tankers,
W76-09865 5G

Offshore Petroleum and New England - A Study of the Regional Economic Consequences of Potential Offshore Oil and Gas Development,
W76-09893 6B

Preliminary Design of a Comprehensive Waste Oil Processing Facility,
W76-09894 5D

Concept Analysis: Offshore Breakwater-Oil Storage System,
W76-09904 8A

OIL POLLUTION
The Coanda Effect Oil/Water Separator: A Development Study,
W76-09890 5G

Airborne Detection and Mapping of Oil Spills, Grand Bahamas,
W76-09891 5A

Development of a Boat and Helicopter Deployable Oil Slick Sampler,
W76-09892 5A

Preliminary Design of a Comprehensive Waste Oil Processing Facility,
W76-09894 5D

Oil Spill and Oil Pollution Reports, November 1974 - February 1975,
W76-09896 5A

Determining the Concentration of Oil in Water Samples by Infrared Spectrophotometry. Phase II. Interlaboratory Study. Volume II,
W76-09900 5A

Determining the Concentration of Oil in Water Samples by Infrared Spectrophotometry. Phase II. Interlaboratory Study. Volume III,
W76-09901 5A

Operational Model for Predicting the Movement of Oil in Canadian Navigable Waters,
W76-09908 5B

OIL SAMPLERS
Development of a Boat and Helicopter Deployable Oil Slick Sampler,
W76-09892 5A

OIL SPILLS
Microbial Degradation of Model Petroleum at Low Temperatures,
W76-09648 5C

Airborne Detection and Mapping of Oil Spills, Grand Bahamas,
W76-09891 5A

Development of a Boat and Helicopter Deployable Oil Slick Sampler,
W76-09892 5A

Oil Spill and Oil Pollution Reports, November 1974 - February 1975,
W76-09896 5A

Development of a Prototype Airborne Oil Surveillance System, Final Report,
W76-09898 5A

Oil in the Arctic,
W76-09902 5C

Operational Model for Predicting the Movement of Oil in Canadian Navigable Waters,
W76-09908 5B

Effects of Petroleum Pollutants on Arctic Microbial Populations,
W76-09909 5C

An Environmental Research Program for Drilling in the Canadian Beaufort Sea,
W76-09912 5G

Coast Guard's Response to Spilled Oil,
W76-09915 5A

OIL WASTES
A Screening Bioassay Using Daphnia Pulex for Refinery Wastes Discharged into Freshwater,
W76-09653 5A

OIL-WATER SEPARATORS
The Coanda Effect Oil/Water Separator: A Development Study,
W76-09890 5G

OILY WATER
Microbial Degradation of Model Petroleum at Low Temperatures,
W76-09648 5C

The Coanda Effect Oil/Water Separator: A Development Study,
W76-09890 5G

Development of a Batchwise In-situ Regeneration Type Separator to Remove Oil from Oil-Water Suspensions,
W76-09895 5G

ON-SITE INVESTIGATIONS
Species Composition and Diversity of Polychaetes in the New York Bight,
W76-09650 5C

OPEN CHANNELS
Proposed Revision to the Modified Einstein Method of Computing Total Sediment Discharge,
W76-09842 2J

OPERATING COSTS
Objectives and Costs of Advanced Treatment Techniques for Sewage,
W76-09449 5D

OPERATING RULES
Data Requirements for the Optimization of Reservoir Design and Operating Rule Determination,
W76-09622 4A

OPERATIONS
Solution of the Operating Problems of a Modern Sewage Treatment Plant,
W76-09455 5D

Optimal Operation of the Pumping Stations in the Kinnereth-Eshkol Section of the National Water Carrier,
W76-09629 4A

OPERATIONS RESEARCH
A Combined Model for Operating Irrigated Agricultural Systems Under Uncertainties,
W76-09634 3F

Metagame Theory and its Applications to Water Resources,
W76-09847 6A

OPTIMIZATION
On the Capacity-Expansion of Desalination Plants and Storage Tanks,
W76-09618 3A

Data Requirements for the Optimization of Reservoir Design and Operating Rule Determination,
W76-09622 4A

Optimal Activated Sludge Design Under Uncertainty,
W76-09628 5D

Least Cost Design of Activated Sludge Systems,
W76-09638 5D

Parameter Optimization for Watershed Models,
W76-09853 2A

OREGON
Monitoring Wells,
W76-09558 4B

Hydrologic Unit Map--1974, State of Oregon,
W76-09827 7C

Specifications for Container Facilities by Simulation,
W76-09943 6A

ORGANIC CARBON
Using a CHN Analyzer to Reduce Carbonate Interference in Particulate Organic Carbon Analyses,
W76-09940 5A

ORGANIC COMPOUNDS
Determination of Tetramethylthiuram Disulfide (TMTD) in Water and Air by Colimetry, (In Russian),
W76-09590 5A

The Chemistry of Ozone in the Treatment of Water,
W76-09684 5F

Application of Real-Time Mass Spectrometric Techniques to Environmental Organic Geochemistry. I. Computerized High Resolution Mass Spectrometry and Gas Chromatography-Low Resolution Mass Spectrometry,
W76-09687 5A

Organic Contaminants of Water,
W76-09689 5A

Evaluation of Combined Applications of Ultrafiltration and Complexation Capacity Techniques to Natural Waters,
W76-09690 5A

Problems Concerning the Character of Oxidizability of Certain Organic Substances in Water Treated with Ozone (Problemes lies A L'Evolution Du Caractere D'Oxydabilite De Certain Corps Organiques Presents Dans L'Eau Tratee Par L'Ozone),
W76-09692 5D

Sanitary Inspection of Surface Waters Polluted with Aromatic Amino and Nitro-Compounds, (In Russian),
W76-09798 5A

Determination, Storage, and Preservation of Low Molecular Weight Hydrocarbon Gases in Aqueous Solution,
W76-09834 2K

ORGANIC MATTER
The Qualitative Organic Matter Composition of Some Marshy Soils of Nizhnevelikoretsk Plain, (In Russian),
W76-09888 2G

ORGANIC SEDIMENTS
Organic Sediment Model for Wastewater Outfall,
W76-09951 5B

ORGANIC WASTES
Organic Sediment Model for Wastewater Outfall,
W76-09951 5B

OROGRAPHY
On The Rainfall and Water Potential of Nepal,
W76-09642 2B

OSCILLOPOLAROGRAPHIC TECHNIQUE
Oscillopolarographic Determination of Cyanide in Waste Electroplating Industrial Effluents,
W76-09822 5A

OUTER CONTINENTAL SHELF
Combination Providing Safety Berthing, Unloading of Oil, and Conduit Carriage to Refineries on Land, of Large Deep-Sea-Requiring Tankers,
W76-09865 5G

Assessing Potential Ocean Pollutants,
W76-09889 5G

Airborne Detection and Mapping of Oil Spills, Grand Bahamas,
W76-09891 5A

Offshore Petroleum and New England - A Study of the Regional Economic Consequences of Potential Offshore Oil and Gas Development,
W76-09893 6B

Development of a Batchwise In-situ Regeneration Type Separator to Remove Oil from Oil-Water Suspensions,
W76-09895 5G

Oil Spill and Oil Pollution Reports, November 1974 - February 1975,
W76-09896 5A

Development of a Prototype Airborne Oil Surveillance System, Final Report,
W76-09898 5A

Coastal Water Research Project. Annual Report for the Year Ended 30 June 1975,
W76-09899 5B

Oil in the Arctic,
W76-09902 5C

Environmental Impact Study of Offshore Sand and Gravel Mining,
W76-09910 6G

An Environmental Research Program for Drilling in the Canadian Beaufort Sea,
W76-09912 5G

Academic Data-Needs for Environmental Assessments of Offshore Technological Operations,
W76-09914 6G

OUTFALL SEWERS
A Comparison Between the Efficacy of Submarine Outfall Disposal of Advanced Primary Effluent and Conventional Treatment,
W76-09448 5E

Organic Sediment Model for Wastewater Outfall,
W76-09951 5B

OUTFALLS
Development of Edinburgh's Sewage Disposal Scheme,
W76-09707 5D

OVERDRAFT
The Over-Exploitation of Groundwater Resources in Dry Regions,
W76-09479 4B

OVERFLOW
Give Stormwater Pollutants the Spin,
W76-09461 5D

Combined Sewage Overflows - Frequency, Environmental Effects, and a Corrective Program,
W76-09741 5D

OXIDATION
Stabilization of Waste Material,
W76-09425 5D

Pilot Plant Experience in the Treatment of Industrial and Municipal Waste-Water by Means of Radiation-Induced Oxidation,
W76-09545 5D

Studies on the Metabolism of a Sulfur-Oxidizing Bacterium. VII. Purification and Characterization of Soluble Components Indispensables for Sulfur Oxidation by Thiobacillus Thiooxidans,
W76-09592 5C

Problems Concerning the Character of Oxidizability of Certain Organic Substances in Water Treated with Ozone (Problemes lies A L'Evolution Du Caractere D'Oxydabilite De Certain Corps Organiques Presents Dans L'Eau Tratee Par L'Ozone),
W76-09692 5D

Apparatus for Purification of Industrial Waste Water,
W76-09861 5D

OXIDATION LAGOONS
Microbial Reactions in Facultative Oxidation Ponds -- I. The Anaerobic Nature of Oxidation Pond Sediments,
W76-09435 5D

OXIDATION-REDUCTION POTENTIAL
Redox Potential in Irrigated Desert Soils as an Indicator of Aeration Status,
W76-09488 2G

OXYGEN
The Relationship Between Dissimilatory Nitrate Reduction and Oxygen Uptake by Cells of an Alcaligenes Strain in Flocs and in Suspension and by Activated Sludge Flocs,
W76-09686 5D

OXYGEN ACTIVATED SLUDGE
The Operation of a Simplex Activated Sludge Pilot Plant in an Atmosphere of Pure Oxygen,
W76-09669 5D

OXYGENATION
Wastewater Treatment System with Controlled Mixing,
W76-09433 5D

Radiation Chemical Destruction of Phenol in Oxygenated Aqueous Solutions,
W76-09530 5D

OYSTERS
On the Extermination of Polyclads: Calcium Hypochlorite (CaOCl2) Treatment in the Period of High Water Temperature, (In Korean),
W76-09801 5C

OZONE
Ozone Provides Alternative for Secondary Effluent Disinfection. Part 1,
W76-09445 5D

Radiation Treatment of Wastes, A Review,
W76-09517 5D

Comparison of the Chemical Effects of Oxone and of Irradiation on Organic Impurities in Water,
W76-09535 5D

The Chemistry of Ozone in the Treatment of Water,
W76-09684 5F

Problems Concerning the Character of Oxidizability of Certain Organic Substances in Water Treated with Ozone (Problemes lies A L'Evolution Du Caractere D'Oxydabilite De Certain Corps Organiques Presents Dans L'Eau Tratee Par L'Ozone),
W76-09692 5D

Operation of Ozone Treatment Apparatus (Ozone shori sochi no unten),
W76-09713 5F

Ozone Provides Alternative for Secondary Effluent Disinfection Part 2,
W76-09715 5D

PACIFIC OCEAN
Observations of the California Undercurrent Off Washington and Vancouver Island,
W76-09584 2L

Upwelling Near Samalga Pass,
W76-09585 2L

Diagnostic Model Study of Mixed-Layer Depths in the Summer North Pacific,
W76-09719 2L

The Role of Vertical Motion in the Heat Budget of the Upper Northeastern Pacific Ocean,
W76-09720 2L

Probability Distributions of Breaking Wave Heights Emphasizing the Utilization of the Jonswap Spectrum,
W76-09721 2L

PACKAGE PLANTS
Technique Alternatives for a Package Stabilization Plant,
W76-09705 5D

PALO ALTO (CALIF)
Use of Mathematical Models in the Palo Alto Marshland Rehabilitation Project,
W76-09949 8B

PARAMETRIC HYDROLOGY
Estimating Selected Parameters for the Kentucky Watershed Model from Watershed Characteristics,
W76-09852 2A

Parameter Optimization for Watershed Models,
W76-09853 2A

PARAMETRIC PROGRAMMING
Identification of Linear Systems Response by Parametric Programing,
W76-09575 2E

PARASITISM
Experience with a Pilot Plant for the Irradiation of Sewage Sludge, Bacterial and Parasitological Studies AfterIrradiation.
W76-09548 5D

PARTICLE-LADEN JETS
Particle-Laden Jets with Application to Ocean Dumping,
W76-09959 5B

PASTEURIZATION
Practical Aspects of the Pasteurization of Sewage Sludge by Electron Irradiation,
W76-09540 5D

Costs and Hygienic Necessity of Sewage Sludge Pasteurization in Switzerland,
W76-09542 5D

Effects of Gamma Radiation at Pilot Plant Level Compared with the Effects of Pasteurization on the Dewatering of Sewage Sludge,
W76-09550 5D

PATENTS
Method for Eliminating Organic and Inorganic Bound Nitrogen from Domestic and Industrial Waste Water,
W76-09413 5D

Sanitary Waste Treatment Plant,
W76-09414 5D

Aerated Sewerage Disposal,
W76-09415 5D

Sludge Removal System,
W76-09416 5D

Sewage Treatment Tank and Tube Settler,
W76-09417 5D

Marine Sewage Disposal Device,
W76-09418 5D

Sludge Control and Decant System,
W76-09419 5D

Apparatus for Sewage Treatment and Wastewater Reclamation,
W76-09420 5D

Separation of Sludge,
W76-09421 5D

Sewage Treatment Process,
W76-09422 5D

Sewage Treatment Aeration Systems,
W76-09423 5D

Method and Apparatus for Rejuvenating a Bed of Granular Filter Medium,
W76-09424 5D

Stabilization of Waste Material,
W76-09425 5D

Septic Tank System,
W76-09426 5D

Waste Treatment Plants,
W76-09427 5E

Process and Apparatus for the Incineration of Aqueous Sewage Sludge,
W76-09428 5E

Apparatus for Treating Industrial and Domestic Waste Waters,
W76-09429 5D

Sewage Septic System for a Plurality of Drain Fields,
W76-09430 5D

Waste Purification System,
W76-09431 5D

Waste Treatment Apparatus,
W76-09432 5D

Wastewater Treatment System with Controlled Mixing,
W76-09433 5D

Cationic Acrylamide-Styrene Copolymers and Flocculation of Sewage Therewith,
W76-09434 5D

Removal of Phosphate from Waste Water,
W76-09458 5D

Sewage Treatment System,
W76-09854 5D

Water Treatment Process and Apparatus,
W76-09855 5D

Method of Biological Purification of Industrial Effluents from Chromates and Bichromates,
W76-09856 5D

Membrane Support-Plates and Fluid Separating Apparatus in which They are Present,
W76-09857 5D

Method and Composition for Preventing Water Contaminated with Industrial Waste from Seeping Through Soil Containing Said Water,
W76-09858 5G

Open-Loop Water-Washable Inspection Penetrant Process,
W76-09859 5D

Apparatus for Purification of Industrial Waste Water,
W76-09861 5D

Domestic Water Filtration Apparatus,
W76-09862 5F

Supported Semi-Permeable Membranes,
W76-09863 3A

Semipermeable Membrane and Process for the Preparation Thereof,
W76-09864 3A

Combination Providing Safety Berthing, Unloading of Oil, and Conduit Carriage to Refineries on Land, of Large Deep-Sea-Requiring Tankers,
W76-09865 5G

Irrigation System Pivot Swivel,
W76-09866 3F

Apparatus and Method for Recovering Pure Water from Natural Sources and Industrial Polluted Waste Sources,
W76-09867 5G

Liquid Distribution System for Irrigation and the Like,
W76-09868 3F

Irrigation Vehicle,
W76-09869 3F

Drip Level Irrigation,
W76-09870 3F

Method and Apparatus for Converting Saline Water to Fresh Water,
W76-09871 3A

Method and Apparatus for the Conversion of an Aqueous Scale-Formed Liquid,
W76-09872 3A

Method of Operating a Purifying Plant and Tank for Practicing Said Method,
W76-09873 5D

Furnace for Thermal Treatment of Liquid Industrial Waste Waters Containing Toxic Organic Impurities (Pech' Dlya Termicheskogo Obezvrezhivaniya Zhidkikh Promyshlennykh Stokov S Toksicheskimi Organicheskimi Primesyami),
W76-09875 5D

Preparation of Reverse Osmosis Membranes by Complete Evaporation of the Solvent System,
W76-09876 3A

Reverse Osmosis Process Using Crosslinked Aromatic Polyamide Membranes,
W76-09877 3A

PATH OF POLLUTANTS
Discussion of Possible Effects Due to Mixing of Radioactive and Thermal Releases to the Atmosphere from Nuclear Power Plants,
W76-09502 5A

Numerical Simulation of Waste Movement in Steady Groundwater Flow Systems,
W76-09564 5B

The Concentration of Dissolved Solids and River Flow,
W76-09577 5B

Longitudinal Dispersion Coefficients for Streams,
W76-09589 5B

Nitrogen in the Subsurface Environment,
W76-09662 5B

Distribution of Bdellovibrio Bacteriovorus in Sewage Works, River Water, and Sediments,
W76-09698 5A

Sediment Properties, Lake Champlain: 1971-1975,
W76-09763 5B

Radiation Hazard of Iodine-129, (In Russian),
W76-09788 5B

PATHOGENIC BACTERIA
Ecology of Cholera Vibrios, (In Russian),
W76-09409 5C

Sanitary Effect of Gamma Irradiation on Sewage Sludge,
W76-09527 5D

PATHOLOGY
Substitute Chemical Program - Initial Scientific and Minieconomic Review of Captan.
W76-09651 5C

PELTIGERA SP
Dependence of the Level of Nitrogenase Activity on the Water Content of the Thallus in Peltigera Canina, P. Evansiana, P. Polydactyla, and P. Praetextata,
W76-09916 5A

PENNSYLVANIA
Erosion Control During Pipeline Construction,
W76-09743 5G

Hydrology and Sedimentation of Bixler Run Basin, Central Pennsylvania,
W76-09830 2J

PEQUANNOCK WATERSHED (NJ)
Effects of Management Practices on Water Quality and Quantity: Newark, New Jersey, Municipal Watersheds,
W76-09465 4D

PERCOLATION
The Leaching Behavior of Different Nitrogen Sources in Lysimeter Experiments, (In German),
W76-09793 2G

PERIPHYTON
Effect of Entrainment in Power Station Cooling Systems Studied Using Periphytic Communities,
W76-09498 5C

Environmental Quality Research, First Annual Report,
W76-09654 5C

PERMEABILITY
Effect of an Electric Current on Water Stability of the Structure of Salinized Solonetz, (In Russian),
W76-09804 2G

PERMSELECTIVE MEMBRANES
Membrane Support-Plates and Fluid Separating Apparatus in which They are Present,
W76-09857 5D

PESTICIDE REMOVAL
Development of Laboratory Model Ecosystems as Early Warning Elements of Environmental Pollution,
W76-09643 5C

PESTICIDE RESIDUES
Development of Laboratory Model Ecosystems as Early Warning Elements of Environmental Pollution,
W76-09643 5C

Results of Hygienic and Toxicological Studies of Pesticides in Countries of the Council of Mutual Economic Assistance in 1962-1972, (In Russian),
W76-09884 5G

Pesticide and PCB Residue in Organs of Wild Animals as Indicators of Environmental Contamination, (In German),
W76-09922 5A

PESTICIDES
Substitute Chemical Program - Initial Scientific and Minieconomic Review of Captan.
W76-09651 5C

PETROLEUM
Concept Analysis: Offshore Breakwater-Oil Storage System,
W76-09904 8A

PHENOLS
Radiation Chemical Destruction of Phenol in Oxygenated Aqueous Solutions,
W76-09530 5D

PHOSPHATES
Phosphate Removal--Tackling Eutrophication from the Other Side,
W76-09436 5D

Removal of Phosphate from Waste Water,
W76-09458 5D

Transformation of Concentrated and Complex Phosphorus Fertilizers in Modow-Bog Soil with a High Moisture Content, (In Azerbaijani),
W76-09786 5B

PHOSPHORUS
Phosphorus and Nitrogen Cycle on a Transect in Lake Ontario During the International Field Year 1972-1973 (IFYGL),
W76-09594 5C

Transformation of Concentrated and Complex Phosphorus Fertilizers in Modow-Bog Soil with a High Moisture Content, (In Azerbaijani),
W76-09786 5B

Sedimentation and Phosphorus Balance in Lake Lucerne (Horw Bay) and in the Rotsee, (In German),
W76-09790 5C

Effect of Excess Soil Moisture on the Content of Phosphorus Compounds in Barley, (In Russian),
W76-09913 3F

PHOTOMETRY
Turbidimeter Lights the Way to Accurate Process Control,
W76-09694 5A

Determination of Fluorine in Drinking Water with a Cerium(III)- or Lanthanum Alizarin Complex, (In Russian),
W76-09796 5A

PHOTOSYNTHESIS
Sugar Beet Photosynthesis and Productivity Cultivated by Irrigated Farming in the Kirgiz SSR, (In Russian),
W76-09810 3F

Primary Production in the Frozen Lake Balaton,
W76-09991 5C

PHYSICOCHEMICAL PROPERTIES
A Simple Physicochemical Method of Detecting Traces of Surfactants in Water,
W76-09927 5A

PHYTOPLANKTON
Studies of Phytoplankton Ecology in the Bay of Valparaiso: II. Phytoplankton 1970-1971, (In Spanish),
W76-09408 5A

Biological Effects of Simulated Discharge Plume Entrainment at Indianpoint Nuclear Power Station, Hudson River Estuary, USA,
W76-09497 5C

Environmental Responses to Thermal Discharges from the Chesterfield Station, James River, Virginia,
W76-09652 5C

An Observation of Water Quality and Red Water in Still Water Fish Ponds, (In Korean),
W76-09799 5C

Organic Productivity of Inshore and Offshore Waters of Barbados: A Study of the Island Mass Effect,
W76-09938 5C

Quantitative Aspect of the Phytoplankton of the Bay Du Levrier (Mauritania), (In French),
W76-09987 5C

The Primary Production of Phytoplankton in Lake Balaton April-September 1972,
W76-09992 5C

PIGGERY WASTES
The Hygienic Quality of the Water in a Growing-Finishing Piggery, (In Romanian),
W76-09883 5B

PILES (FOUNDATIONS)
Transverse Forces on Vertical Cylinders in Waves,
W76-09583 8B

PILOT PLANTS
Sludge/Activated Carbon Cycle Treats Sewage.
W76-09443 5D

Carbon Made from Sewage Solids Treats Wastewater.
W76-09450 5D

Pilot Plant Experience in the Treatment of Industrial and Municipal Waste-Water by Means of Radiation-Induced Oxidation,
W76-09545 5D

Experience with a Pilot Plant for the Irradiation of Sewage Sludge; Design, Operation Experience and Cost Calculations After 18 Months of Continuous Running,
W76-09546 5D

Experience with a Pilot Plant for the Irradiation of Sewage Sludge, Bacterial and Parasitological Studies AfterIrradiation.
W76-09548 5D

Experience with a Pilot Plant for the Irradiation of Sewage Sludge, Experiments on the Inactivation of Viruses in Sewage Sludge after Radiation Treatment,
W76-09549 5D

Effects of Gamma Radiation at Pilot Plant Level Compared with the Effects of Pasteurization on the Dewatering of Sewage Sludge,
W76-09550 5D

Experience with a Pilot Plant for the Irradiation of Sewage Sludge, Analytical Studies on Sewage Sludge and Plant Material,
W76-09552 5D

The Operation of a Simplex Activated Sludge Pilot Plant in an Atmosphere of Pure Oxygen,
W76-09669 5D

PIPE FLOW
Hydrodynamic Separation of Solids from Solid-Liquid Mixtures,
W76-09716 5D

PIPE RELINING
Polyethylene Pipe Tackles Difficult Sewer Repair Job,
W76-09403 8G

Polyethylene Pipe Insertion Rehabilitates Old Sewers,
W76-09459 8G

PIPELINES
How Many Sewer Leaks Can You Afford.
W76-09404 8G

Polyethylene Pipe Insertion Rehabilitates Old Sewers,
W76-09459 8G

Erosion Control During Pipeline Construction,
W76-09743 5G

PISCICIDES
Reaction Times of Certain Freshwater Fishes to a Rotenone-Containing Piscicide,
W76-09993 5C

PLANKTON
Plankton Analysis Training Manual.
W76-09782 5C

Rotifer Production in Lake Baikal, (In Russian),
W76-09791 5C

The Algal Population of Duemmer Lake in the Years 1970/71, (In German),
W76-09812 5C

PLANNING
Cost of Producing Crops in the Irrigated Southwest, Part II: New Mexico,
W76-09475 3F

Energy Systems: Modeling and Policy Planning,
W76-09608 6A

Construction Planning of a Hydro Power Station,
W76-09616 8C

A Combined Model for Operating Irrigated Agricultural Systems Under Uncertainties,
W76-09634 3F

The Contribution of a Water Information System for Environmental Planning in Minnesota,
W76-09753 6G

PLANT DISEASES
Meteorological Factors and Disease Expressions in Jute,
W76-09931 3F

PLANT GROWTH
A Quantitative Analysis of the Factors Affecting Plant Nutrient Uptake from Some Soils,
W76-09489 2G

Effects of Flooding and of Irrigation Water Salinity on Eucalyptus Camaldulensis Dehn. From Three Seed Sources,
W76-09664 3C

Phytomass Dynamics of Aboveground and Underground Organs of Meadow Steppe Plants, (In Russian),
W76-09817 2I

PLANT PHYSIOLOGY
Effectiveness of Water Utilization by Plants, (In Ukranian),
W76-09809 2D

Phytomass Dynamics of Aboveground and Underground Organs of Meadow Steppe Plants, (In Russian),
W76-09817 2I

PLANT POPULATIONS
Planting Pattern, Plant Population, Irrigation, and Insect Interactions in Cotton.
W76-09998 3F

PLANT WATER CONTENT
Hydratability as a Parameter of Plant Water Potential, (In French),
W76-09918 2I

PLANTING MANAGEMENT
Planting Pattern, Plant Population, Irrigation, and Insect Interactions in Cotton.
W76-09998 3F

PLASTIC PIPES
Polyethylene Pipe Tackles Difficult Sewer Repair Job,
W76-09403 8G

Polyethylene Pipe Insertion Rehabilitates Old Sewers,
W76-09459 8G

PLASTICS
GRP Launders at Sewage Treatment Plant.
W76-09462 8G

Radiation Recycling Process of Waste Poly(Tetrafluorethylene) Scrap,
W76-09556 5D

PLATTE RIVER SEEPAGE (NEB)
Effects of Land Use and River Seepage on Groundwater Quality in Hall County, Nebraska,
W76-09728 5B

PO RIVER DELTA (ITALY)
A Site Study of the Multiple Effects of Thermal Releases on the Aquatic Life in an Estuarine Area,
W76-09505 5C

PODZOLS
Investigations on the Erodibility of a Deeply Plowed Gray-Brown Podzolic Soil from Loess on a Slope by Means of Simulated Rain, (In German),
W76-09917 2J

Total Porosity and Pore Size Distribution in Untilled and Tilled Loess Soils, (In German),
W76-09939 2G

POISIONS
'Toxic' or 'Poisonous' Water, (In Russian),
W76-09932 5C

POISONS
Pathology of Acute Poisoning with the Insecticide Sevin in the Bent-Nosed Clam, Macoma Nasuta,
W76-09649 5C

POLAND (LUKNIANY LAKE)
The Vegetation of the 'Lukniany Lake' Nature Reserve in the Mazurian Lake District,(In Polish),
W76-09990 5C

POLAROGRAPHIC ANALYSIS
Oscillopolarographic Determination of Cyanide in Waste Electroplating Industrial Effluents,
W76-09822 5A

POLICY ISSUES
Energy Projections--Relationship to Policy Issues,
W76-09603 6A

POLITICAL ASPECTS
Metagame Theory and its Applications to Water Resources,
W76-09847 6A

POLLUTANT IDENTIFICATION
Isolation of Salmonella from Sewage and Surface Waters, (In Russian),
W76-09411 5A

Exploration Rock Geochemistry-Detection of Trace Element Halo at Heath Steele Mines (N. B., Canada) by Discriminant Analysis,
W76-09473 2K

Surveys on Radiation-Resistant Asporogenic Bacteria in Natural Environments,
W76-09519 5C

Hydrologic and Chemical Analysis of the Principal Piedmontese Tributaries of Lago Maggiore in Relation to its Trophic Modifications, (In Italian),
W76-09576 5C

Determination of Tetramethylthiuram Disulfide (TMTD) in Water and Air by Colimetry, (In Russian),
W76-09590 5A

Myxobacteria of the Myxococcus Group as Indirect Indicators of Fecal Matter in Surface Water: 1. Communication, (In German),
W76-09591 5A

Isolation of Water Vibrios in Greece, (In French),
W76-09601 5A

Determination of Microquantities of Naphthalene in Environmental Objects, (In Russian),
W76-09620 5A

The Role of Bioassays in Environmental Research,
W76-09644 5A

A Screening Bioassay Using Daphnia Pulex for Refinery Wastes Discharged into Freshwater,
W76-09653 5A

Application of Real-Time Mass Spectrometric Techniques to Environmental Organic Geochemistry. I. Computerized High Resolution Mass Spectrometry and Gas Chromatography-Low Resolution Mass Spectrometry,
W76-09687 5A

Dissolved Oxygen Analyzer T-01 Analyzer. A Simple Apparatus for Electrochemical Determination of Dissolved Oxygen in Water (Tlenomierz T-01 uproszczony przyrzad elektrochemicznego oznaczania tleunu roxpuszczomego w roztworach wodnych),
W76-09688 5A

Organic Contaminants of Water,
W76-09689 5A

Evaluation of Combined Applications of Ultrafiltration and Complexation Capacity Techniques to Natural Waters,
W76-09690 5A

Problems Concerning the Character of Oxidizability of Certain Organic Substances in Water Treated with Ozone (Problemes lies A L'Evolution Du Caractere D'Oxydabilite De Certain Corps Organiques Presents Dans L'Eau Tratee Par L'Ozone),
W76-09692 5D

Turbidimeter Lights the Way to Accurate Process Control,
W76-09694 5A

Steroids in Effluents,
W76-09696 5A

Trace-Element Analysis Using X-Ray Emission Spectroscopy,
W76-09697 5A

Distribution of Bdellovibrio Bacteriovorus in Sewage Works, River Water, and Sediments,
W76-09698 5A

Laboratory Evaluation of the Coulter On-Line Particle Monitor,
W76-09699 5A

How to Build a Better Bench Sheet,
W76-09701 5D

Representative Dirty Water Sampling,
W76-09702 5A

Pollution Influence on the Infusorial Fauna (Protozoa, Ciliata) of Bulgarian Rivers II. The Ogosta River and its Effluents,
W76-09714 5A

Concentration of Heavy Metals in Sediments of a Hydroelectric Impoundment,
W76-09755 5A

Materials Budgets of Lake Champlain,
W76-09756 5A

Improving Water Quality by control of Algae: Cellular and Extracellular Blue-Green Algal Polysaccharides,
W76-09760 5G

Sediment Properties, Lake Champlain: 1971-1975,
W76-09763 5B

Marine Soil Pollution and Self-Purification, (In Russian),
W76-09789 5A

Presence and Some Properties of Bacteria of the Family Pseudomonadaceae in the River Danube, (In German),
W76-09792 5A

Determination of Fluorine in Drinking Water with a Cerium(III)- or Lanthanum Alizarin Complex, (In Russian),
W76-09796 5A

Hygienic Standardization of Tin Dibutyl Diisooctylthioglycolate in Water Bodies, (In Russian),
W76-09797 5C

Sanitary Inspection of Surface Waters Polluted with Aromatic Amino and Nitro-Compounds, (In Russian),
W76-09798 5A

Iron-Manganese Microorganisms Studied by Overgrowing Technique, (In Russian),
W76-09813 5A

The Heavy Metal Concentrations in the Waters Along the Coast of Fukuyama, (In Japanese),
W76-09815 5A

Oscillopolarographic Determination of Cyanide in Waste Electroplating Industrial Effluents,
W76-09822 5A

Balanidae as Pollution Indicators in the Bay of Guanabara, (In Portuguese),
W76-09823 5A

Airborne Detection and Mapping of Oil Spills, Grand Bahamas,
W76-09891 5A

Development of a Boat and Helicopter Deployable Oil Slick Sampler,
W76-09892 5A

Preliminary Design of a Comprehensive Waste Oil Processing Facility,
W76-09894 5D

Oil Spill and Oil Pollution Reports, November 1974 - February 1975,
W76-09896 5A

Development of a Prototype Airborne Oil Surveillance System, Final Report,
W76-09898 5A

Coastal Water Research Project. Annual Report for the Year Ended 30 June 1975,
W76-09899 5B

Determining the Concentration of Oil in Water Samples by Infrared Spectrophotometry. Phase II. Interlaboratory Study. Volume II,
W76-09900 5A

Determining the Concentration of Oil in Water Samples by Infrared Spectrophotometry. Phase II. Interlaboratory Study. Volume III,
W76-09901 5A

Dependence of the Level of Nitrogenase Activity on the Water Content of the Thallus in Peltigera Canina, P. Evansiana, P. Polydactyla, and P. Praetextata,
W76-09916 5A

Pesticide and PCB Residue in Organs of Wild Animals as Indicators of Environmental Contamination, (In German),
W76-09922 5A

A Simple Physicochemical Method of Detecting Traces of Surfactants in Water,
W76-09927 5A

Technique of Water Sampling in Sanitary Investigations of Large Bodies of Water, (In Russian),
W76-09928 5A

Gas-Liquid Chromatographic Determination of Butyl Acetate, Butanol and Acetone Present Together in Waste Waters, (In Russian),
W76-09929 5A

Using a CHN Analyzer to Reduce Carbonate Interference in Particulate Organic Carbon Analyses,
W76-09940 5A

POLLUTANTS

Hydrodynamic and Material Transport Model for Mobile Bay, Alabama,
W76-09983 5B

POLLUTION ABATEMENT

Financing Pollution Abatement Equipment for Textiles and Other South Carolina Industries,
W76-09766 5G

Presentation Concerning Pollution Control Facilities Revenue Bonds,
W76-09767 5G

Role of the Underwriter in Tax Exempt Financing for Industrial Expansion and Pollution Control,

POLLUTION CONTROL BONDS

The Pollution Control Bond,
W76-09771 5G

POLLUTION IDENTIFICATION

Sensors for Continuous Monitoring of Toxic Ions, Nutrients, and Dissolved Gases in Water,
W76-09906 5A

Coast Guard's Response to Spilled Oil,
W76-09915 5A

POLYCHAETES

Species Composition and Diversity of Polychaetes in the New York Bight,
W76-09650 5C

POLYCHLORINATED BIPHENYLS

Pesticide and PCB Residue in Organs of Wild Animals as Indicators of Environmental Contamination, (In German),
W76-09922 5A

POLYCLADS

On the Extermination of Polyclads: Calcium Hypochlorite (CaOC12) Treatment in the Period of High Water Temperature, (In Korean),
W76-09801 5C

POLYELECTROLYTES

Purification of Waste Water By Polymer Exchangers (Jatevesien puhdistaminen polymeerivaihtajilla),
W76-09675 5D

POLYMERS

Cationic Acrylamide-Styrene Copolymers and Flocculation of Sewage Therewith,
W76-09434 5D

Van Clarifies Sludge Options,
W76-09438 5F

Purification of Waste Water By Polymer Exchangers (Jatevesien puhdistaminen polymeerivaihtajilla),
W76-09675 5D

POLYSACCHARIDES

Improving Water Quality by control of Algae: Cellular and Extracellular Blue-Green Algal Polysaccharides,
W76-09760 5G

PONDEROSA PINE TREES

Effect of Thinning on the Foliage and Forest Floor Properties of Ponderosa Pine Stands,
W76-09474 4A

Distribution of Ponderosa Pine Forest Densities on the Salt-Verde River Basin,
W76-09477 4A

POROSITY

Total Porosity and Pore Size Distribution in Untilled and Tilled Loess Soils, (In German),
W76-09939 2G

PORTS

Concept Analysis: Offshore Breakwater-Oil Storage System,
W76-09904 8A

Recommended Procedure for Developing Deepwater Ports Design Criteria,
W76-09907 5G

POTABLE WATER

Operation of Ozone Treatment Apparatus (Ozone shori sochi no unten),
W76-09713 5F

POTENTIOMETERS

Sensors for Continuous Monitoring of Toxic Ions, Nutrients, and Dissolved Gases in Water,
W76-09906 5A

POWER GENERATION

Scope of Tidal Power from Indian Estuaries,
W76-09639 2L

POWERPLANTS

Temperature Predictions for Offshore Power Plants,
W76-09960 5B

Undistorted Movable-Bed Model Study for a River and Power Plant Intake System,
W76-09971 8B

PRE-TREATMENT (WATER)

A Comparison Between the Efficacy of Submarine Outfall Disposal of Advanced Primary Effluent and Conventional Treatment,
W76-09448 5E

PRECIPITATION (ATMOSPHERIC)
Overview of Rainfall-Runoff Process in Urban Areas,
W76-09730 2A

PRECIPITATION EXCESS
Sensitivity of Linear and Nonlinear Surface Runoff Models to Input Errors,
W76-09578 2A

PRESERVATION
The Mercury Content of Industrial Fish Products: Its Relative Variation with the Treatment (Cooking in Salt Water, Pickling and Fish Production), (In Spanish),
W76-09802 5C

PRESSURE MEASURING INSTRUMENTS
An Underwater Temperature-Depth Data Collection Device,
W76-09727 2H

PRIMARY PRODUCTIVITY
Environmental Responses to Thermal Discharges from the Chesterfield Station, James River, Virginia,
W76-09652 5C

Biological Production Processes in the Ural River, (In Russian),
W76-09919 5C

Organic Productivity of Inshore and Offshore Waters of Barbados: A Study of the Island Mass Effect,
W76-09938 5C

Quantitative Aspect of the Phytoplankton of the Bay Du Levrier (Mauritania), (In French),
W76-09987 5C

Primary Production in the Frozen Lake Balaton,
W76-09991 5C

The Primary Production of Phytoplankton in Lake Balaton April-September 1972,
W76-09992 5C

PRIVATE WATER FIRMS
Water Authority Rate Making,
W76-09717 6C

PROBABILITY
A Probabilistic Model of the Oil and Gas Discovery Process,
W76-09604 6A

PROCESS CONTROL
Turbidimeter Lights the Way to Accurate Process Control,
W76-09694 5A

PRODUCTION
Rotifer Production in Lake Baikal, (In Russian),
W76-09791 5C

PRODUCTION DECLINE
Sioux Falls Restores Four Wells with Collector Pipe,
W76-09510 3B

PRODUCTIVITY
Engineering Reclamation, A Most Important Means of Increasing Fish Productivity of Waters, (In Russian),
W76-09800 8I

Sugar Beet Photosynthesis and Productivity Cultivated by Irrigated Farming in the Kirgiz SSR, (In Russian),
W76-09810 3F

The Role of Microflora in the Productivity of a Salmon Breeding Lake, (In Russian),
W76-09818 5C

Organic Productivity of Inshore and Offshore Waters of Barbados: A Study of the Island Mass Effect,
W76-09938 5C

PROJECT PLANNING
National Conference of District Chiefs, Albuquerque, New Mexico, September 28-October 3, 1975--Proceedings,
W76-09838 2A

PROJECT POST-EVALUATION
National Conference of District Chiefs, Albuquerque, New Mexico, September 28-October 3, 1975--Proceedings,
W76-09838 2A

PROJECT PURPOSES
National Conference of District Chiefs, Albuquerque, New Mexico, September 28-October 3, 1975--Proceedings,
W76-09838 2A

PROJECTIONS
Energy Projections--Relationship to Policy Issues,
W76-09603 6A

The Use of Econometrics to Project Energy Demands,
W76-09611 6A

PROJECTS
Joint USA/Japan Project on Global Systems Analysis and Simulation (GLOSAS) of Energy, Resources, and Environmental (ERE) Systems,
W76-09610 6A

Howell Bunger Valves as Irrigation Outlets,
W76-09615 3F

Design of Water Resources Project with Inadequate Data in India - General and Particular Case Studies,
W76-09621 4A

Data Requirements for the Optimization of Reservoir Design and Operating Rule Determination,
W76-09622 4A

PROTEUS
Hygienic Assessment of Changes in Mineral Water Properties During its Treatment for Use in Internal Balneotherapeutic Procedures, (In Russian),
W76-09795 5C

PROTOTYPES
Development of a Prototype Airborne Oil Surveillance System, Final Report,
W76-09898 5A

PROTOZOA
Interstitial Protozoa and Algae of Louisiana Salt Marshes,
W76-09593 5C

Pollution Influence on the Infusorial Fauna (Protozoa, Ciliata) of Bulgarian Rivers II. The Ogosta River and its Effluents,
W76-09714 5A

PROVENANCE
Effects of Flooding and of Irrigation Water Salinity on Eucalyptus Camaldulensis Dehn. From Three Seed Sources,
W76-09664 3C

PSEUDOMONAS
Presence and Some Properties of Bacteria of the Family Pseudomonadaceae in the River Danube, (In German),
W76-09792 5A

PUBLIC HEALTH
Public Health Aspects of Waste-Water Treatment,
W76-09516 5D

PUBLIC LAW 92-500
Report to the Congress by the National Commission on Water Quality,
W76-09663 5G

PUERTO RICO
A Flood Management Model for Urbanizing River Basins,
W76-09737 4C

PUGET SOUND (WASH)
Application of Physical Tidal Models in Harbor and Marina Design,
W76-09984 5B

PUMICE SOILS
The Erodibility of Pumice Soils of the North Island, New Zealand,
W76-09787 4D

PUMPING PLANTS
Optimal Operation of the Pumping Stations in the Kinnereth-Eshkol Section of the National Water Carrier,
W76-09629 4A

PVC
Field Drainage with Manifold Well Points,
W76-09586 5G

PYROLYSIS
Sludge/Activated Carbon Cycle Treats Sewage.
W76-09443 5D

Carbon Made from Sewage Solids Treats Wastewater.
W76-09450 5D

RACINE (WIS)
An Application of the Storm Water Management Model,
W76-09738 5D

RADAR
Accuracy of Reservoir Inflow Forecasts Based on Radar Rainfall Measurements,
W76-09574 2B

RADIATION
Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment,
W76-09490 5C

Radiation for a Clean Environment.
W76-09512 5D

Surveys on Radiation-Resistant Asporogenic Bacteria in Natural Environments,
W76-09519 5C

Viruses and Ionizing Radiation in Respect to Waste-Water Treatment,
W76-09520 5D

Aqueous Radiation Chemistry in Relation to Waste Treatment, An Introductory Review,
W76-09529 5D

Effects of Gamma Radiation from Co60 on Dilute Aqueous Solutions of Linear Alkyl Sulfonate Surfactants and other Organic Pollutants,
W76-09531 5D

RADIATION

Degradation of Persistent Organochlorine Pollutants by Gamma Radiation and its Possible use for Waste-Water Treatment,
W76-09534 5D

Alternative High-Level Radiation Sources for Sewage and Waste-Water Treatment,
W76-09536 5D

Use of High-Power Electron Beam Radiation for the Treatment of Municipal and Industrial Wastes,
W76-09537 5D

Prospects for High-Energy Electron Irradiation of Waste-Water Liquid Residuals,
W76-09538 5D

Radiation Recycling Process of Waste Poly(Tetrafluorethylene) Scrap,
W76-09556 5D

RADIATION CHEMISTRY

Aqueous Radiation Chemistry in Relation to Waste Treatment, An Introductory Review,
W76-09529 5D

RADIOACTIVITY

Impact of Thermal and Radioactive Effluents on a Tropical Nearshore Ecosystem,
W76-09492 5C

RADIOACTIVITY EFFECTS

Interaction Mechanisms of Radioactive, Chemical and Thermal Releases from the Nuclear Industry, Methodology for Considering Co-Operative Effects,
W76-09491 5C

Discussion of Possible Effects Due to Mixing of Radioactive and Thermal Releases to the Atmosphere from Nuclear Power Plants,
W76-09502 5A

Cycling of Fe55 and Zn65 in Columbia River Carp Following Reactor Shutdown,
W76-09508 5C

RADIOECOLOGY

Possible Future Effects on the Population of the Federal Republic of Germany of Gaseous Radioactive Effluents from Nuclear Facilities,
W76-09499 5A

Surveys on Radiation-Resistant Asporogenic Bacteria in Natural Environments,
W76-09519 5C

Use of the Principles and Methods of Radio-Ecology in Solving Some Urgent Problems of Man's Effect on the Environment, (In Russian),
W76-09936 6G

RADIOISOTOPES

The Effect of Temperature on the Uptake and Retention of Co 60 and Zn 65 by the Common Shrimp Crangon Crangon (L),
W76-09493 5C

Influence De La Temperature Sur La Contamination D'Especes Marines Par Le Fer-59, (Influence of Temperature on the Contamination of Marine Species by Iron-59),
W76-09494 5C

Radiation Hazard of Iodine-129, (In Russian),
W76-09788 5B

RAINFALL

Evaluation of Mean Square Error Involved in Approximating the Areal Average of a Rainfall Event by a Discrete Summation,
W76-09572 2B

Accuracy of Reservoir Inflow Forecasts Based on Radar Rainfall Measurements,
W76-09574 2B

On The Rainfall and Water Potential of Nepal,
W76-09642 2B

National Symposium on Urban Rainfall and Runoff and Sediment Control,
W76-09729 4C

The Distribution of Heavy Rainfall in a Major Urban Area,
W76-09734 2B

RAINFALL DISPOSITION

The Distribution of Heavy Rainfall in a Major Urban Area,
W76-09734 2B

RAINFALL INTENSITY

Relationship of Heavy Rainfall to Soil Erosion in View of its Forecasting, (In Bulgarian),
W76-09807 2J

RAINFALL-RUNOFF RELATIONSHIPS

Effects of Management Practices on Water Quality and Quantity: Baltimore, Maryland, Municipal Watersheds,
W76-09464 4D

Watershed Response to Partial Area Applications of Simulated Rainfall,
W76-09467 2A

Design of Water Resources Project with Inadequate Data in India - General and Particular Case Studies,
W76-09621 4A

Overview of Rainfall-Runoff Process in Urban Areas,
W76-09730 2A

Runoff Frequency Procedure for Synthetic Hydrograph Development,
W76-09733 2A

RANNEY HORIZONTAL COLLECTOR WELL

Sioux Falls Restores Four Wells with Collector Pipe,
W76-09510 3B

RATES

Water Authority Rate Making,
W76-09717 6C

RECHARGE

Hydrology of the Madison Formation and its Potential use for Water Supply for Energy Development,
W76-09757 2F

RECLAIMED WATER

Apparatus and Method for Recovering Pure Water from Natural Sources and Industrial Polluted Waste Sources,
W76-09867 5G

RECREATION DEMAND

Problems and Solutions in Estimating the Demand for and Value of Rural Outdoor Recreation,
W76-09633 6D

RECYCLING

Carbon Wastewater Treatment Process,
W76-09441 5D

Recent Advances in the Treatment of Solid Wastes,
W76-09553 5D

Radiation Recycling Process of Waste Poly(Tetrafluorethylene) Scrap,
W76-09556 5D

Anaerobic Treatment of Dilute Waste Waters,
W76-09673 5D

The Desert War on Pollution,
W76-09711 5D

Materials Budgets of Lake Champlain,
W76-09756 5A

Preliminary Design of a Comprehensive Waste Oil Processing Facility,
W76-09894 5D

Development of a Batchwise In-situ Regeneration Type Separator to Remove Oil from Oil-Water Suspensions,
W76-09895 5G

RED WATER

An Observation of Water Quality and Red Water in Still Water Fish Ponds, (In Korean),
W76-09799 5C

REEDS

Comparative Evaluation of Food Plants of the Ararat Cochineal Scale (Porphyrophora Hamelii) (In Russian),
W76-09406 2I

REFINERIES

Offshore Petroleum and New England - A Study of the Regional Economic Consequences of Potential Offshore Oil and Gas Development,
W76-09893 6B

REFRACTION MEASUREMENTS

Sedimentation Rates and Sediment Thickness in Lake Champlain,
W76-09759 2J

REGIONAL ANALYSIS

Problems and Solutions in Estimating the Demand for and Value of Rural Outdoor Recreation,
W76-09633 6D

REGRESSION ANALYSIS

Regression Analysis and Parameter Identification,
W76-09824 7A

Calculation of Water Temperatures in Clear Lake, Iowa,
W76-09879 5B

REHABILITATION

Use of Mathematical Models in the Palo Alto Marshland Rehabilitation Project,
W76-09949 8B

REINFORCED PLASTICS

GRP Launders at Sewage Treatment Plant.
W76-09462 8G

REJUVENATING TECHNIQUES

Sioux Falls Restores Four Wells with Collector Pipe,
W76-09510 3B

RELIABILITY

Improved Techniques for Water Resource Systems Design,
W76-09624 4A

EMOTE CONTROL
Liquid Distribution System for Irrigation and the Like,
W76-09868 3F

EMOTE SENSING
Island Barrier Effects on Sea State as Revealed by a Numerical Wave Model and DMSP Satellite Data,
W76-09559 2L

Research and Investigation of Geology, Mineral, and Water Resources of Maryland.
W76-09565 4A

Differentiation of Serpentinitic from Non-Serpentinitic Ultramafic Rocks in ERTS-1 MSS Imagery,
W76-09566 4A

Observation of Linear Features in the Maryland Piedmont as Shown on ERTS-1 MSS Imagery and Aircraft Support Photography,
W76-09567 4A

Maryland Chesapeake Bay Beaches - General Distribution and Classification,
W76-09568 2L

The Relationship of the Nearshore Longshore Bar and Sand Waves at Ocean City, Maryland,
W76-09569 2L

Linear Distribution of the High Marsh Vegetation Communities of the Lower Eastern Shore and its Geological Significance,
W76-09570 2L

Visual Observation of the Suspended Sediments and Nearshore Ice Signatures in Chesapeake Bay,
W76-09571 2L

Airborne Detection and Mapping of Oil Spills, Grand Bahamas,
W76-09891 5A

Oil Spill and Oil Pollution Reports, November 1974 - February 1975,
W76-09896 5A

Development of a Prototype Airborne Oil Surveillance System, Final Report,
W76-09898 5A

Coast Guard's Response to Spilled Oil,
W76-09915 5A

EPAIRING
Polyethylene Pipe Tackles Difficult Sewer Repair Job,
W76-09403 8G

How Many Sewer Leaks Can You Afford.
W76-09404 8G

ESEARCH PRIORITIES
Landslide Hazard in the United States: A Research Assessment,
W76-09781 6F

ESERVOIR DESIGN
Data Requirements for the Optimization of Reservoir Design and Operating Rule Determination,
W76-09622 4A

ESERVOIR OPERATION
Data Requirements for the Optimization of Reservoir Design and Operating Rule Determination,
W76-09622 4A

RESERVOIRS
A Probabilistic Model of the Oil and Gas Discovery Process,
W76-09604 6A

A Procedure for Estimating Off-Site Sediment Damage Costs and an Empirical Test,
W76-09632 4A

Aqueduct Optimization with Intermediate Storage,
W76-09636 4A

Changes in the Sedimentation Characteristics of an Urbanizing Watershed, Dallas and Collin Counties, Texas,
W76-09745 4C

Hydrologic Data for Mountain Creek, Trinity River Basin, Texas, 1974,
W76-09829 7C

Near-Field Jet Penetration and Reservoir Mixing,
W76-09962 8C

Physical Model of Discharge in a Two-Layer Stratified Ambient,
W76-09963 8B

Sediment Deposition Model for Tarbela Reservoir,
W76-09970 2J

RESOURCES DEVELOPMENT
Offshore Petroleum and New England - A Study of the Regional Economic Consequences of Potential Offshore Oil and Gas Development,
W76-09893 6B

Preliminary Design of a Comprehensive Waste Oil Processing Facility,
W76-09894 5D

Coastal Water Research Project. Annual Report for the Year Ended 30 June 1975,
W76-09899 5B

Oil in the Arctic,
W76-09902 5C

Engineering and Ecological Evaluation of Artificial-Island Design, Rincon Island, Punta Gorda, California,
W76-09903 2L

Concept Analysis: Offshore Breakwater-Oil Storage System,
W76-09904 8A

A Post Construction Survey of Several Manmade Islands Off the Coast of California,
W76-09911 2L

RETENTION
Relationship of Rational and Unit Graph Methods in Retention Basin Design,
W76-09732 4C

REVERSE OSMOSIS
Reverse Osmosis -- Can it Replace Distillation,
W76-09667 5D

Supported Semi-Permeable Membranes,
W76-09863 3A

Semipermeable Membrane and Process for the Preparation Thereof,
W76-09864 3A

Reverse Osmosis Process Using Crosslinked Aromatic Polyamide Membranes,
W76-09877 3A

REVIEWS
Radiation Treatment of Wastes, A Review,
W76-09517 5D

Recent Advances in the Treatment of Solid Wastes,
W76-09553 5D

Anthropogenic Effect on Continental, Marine, and Oceanic Biohydrocoenoses, (In Russian),
W76-09819 5C

RHODE ISLAND
Velocity Observations in the West Passage of Narragansett Bay: A Partially Mixed Estuary,
W76-09561 2L

RICHARDS EQUATION
Upward Water Movement in Field Cores,
W76-09726 3F

RIO GRANDE RIVER
Field Drainage with Manifold Well Points,
W76-09586 5G

RISKS
Optimal Activated Sludge Design Under Uncertainty,
W76-09628 5D

A Combined Model for Operating Irrigated Agricultural Systems Under Uncertainties,
W76-09634 3F

RIVER BASIN DEVELOPMENT
Water System Behavior: Determinants in an Arid Region,
W76-09483 4A

RIVER BASINS
Hydrologic Data for Mountain Creek, Trinity River Basin, Texas, 1974,
W76-09829 7C

Variation and Causative Factors of Sediment Yields in the Arkansas River Basin, Kansas,
W76-09839 2J

A Water-Land Use Management Model for the Sevier River Basin Phases I and II,
W76-09844 4A

RIVER DANUBE
Presence and Some Properties of Bacteria of the Family Pseudomonadaceae in the River Danube, (In German),
W76-09792 5A

RIVER FLOW
The Concentration of Dissolved Solids and River Flow,
W76-09577 5B

River Delta Computer Simulation Model (Simudelt),
W76-09954 2L

RIVER FORECASTING
Hydrologic Forecasting for the Ohio River Waterway,
W76-09944 2E

RIVER MODELS
Modeling of Meandering and Braiding in Rivers,
W76-09974 2J

RIVER SYSTEMS
Water System Behavior: Determinants in an Arid Region,
W76-09483 4A

RIVER SYSTEMS

Numerical Two-Dimensional Flow Model for River Systems,
W76-09964 2E

RIVER THAMES (ENGLAND)

Generation Time, Length of Life, Instar Duration and Frequency of Moulting, and their Relationship to Temperature in Eight Species of Cladocera from the River Thames, Reading,
W76-09658 5C

The Relationship Between Temperature and Duration of Egg Development in Some Epiphytic Cladocera and Copepoda from the River Thames, Reading, with a Discussion of Temperature Functions,
W76-09659 5C

RIVER TONE (JAPAN)

Evaluation of Flood Control Under Changing Conditions,
W76-09630 4A

RIVERBANK RECESSIONS

Riverbank Recessions for Power Plant Facilities,
W76-09973 8B

RIVERS

Howell Bunger Valves as Irrigation Outlets,
W76-09615 3F

Pollution Influence on the Infusorial Fauna (Protozoa, Ciliata) of Bulgarian Rivers II. The Ogosta River and its Effluents,
W76-09714 5A

A Primer on Floodplain Dynamics,
W76-09831 2E

Two-Dimensional Model of Flow Toward Intakes,
W76-09965 2E

Forecasts for the Sacremento River System,
W76-09967 2E

Movable-Bed River-Models,
W76-09969 2E

Sediment Deposition Model for Tarbela Reservoir,
W76-09970 2J

Undistorted Movable-Bed Model Study for a River and Power Plant Intake System,
W76-09971 8B

Physical Modeling Techniques Used in River Models,
W76-09972 2E

Riverbank Recessions for Power Plant Facilities,
W76-09973 8B

Modeling of Meandering and Braiding in Rivers,
W76-09974 2J

River and Estuary Modeling with the Siva System,
W76-09982 2A

ROCKS

Differentiation of Serpentinitic from Non-Serpentinitic Ultramafic Rocks in ERTS-1 MSS Imagery,
W76-09566 4A

ROMANIA (TIS PLAIN)

Studies on the Relationships Between Moisture and Suction in Some Soils of the Tisa Plain, (In Rumanian),
W76-10000 2G

ROOT SYSTEMS

A Quantitative Analysis of the Factors Affecting Plant Nutrient Uptake from Some Soils,
W76-09489 2G

ROTATING DISCS TREATMENT

A Study of Rotating-Disc Treatment Units Operating at Different Temperatures,
W76-09674 5D

ROTENONE

Reaction Times of Certain Freshwater Fishes to a Rotenone-Containing Piscicide,
W76-09993 5C

Laboratory and Field Tests in the Revival of Fish Affected by Rotenone,
W76-09994 5C

ROTIFERS

Rotifer Production in Lake Baikal, (In Russian),
W76-09791 5C

ROTSEE (SWITZERLAND)

Sedimentation and Phosphorus Balance in Lake Lucerne (Horw Bay) and in the Rotsee, (In German),
W76-09790 5C

RUNOFF

Hydrologic Systems Analysis Model for Generating Runoff Time Series (Hidrologiai) Rendszervizsgalati Modell Vizhozamidoser Eloallitasara (II. RESZ),
W76-09557 2A

A Review and Analysis of Selected Hydrologic Modeling Concepts,
W76-09718 2E

Relationship of Rational and Unit Graph Methods in Retention Basin Design,
W76-09732 4C

Physical and Economic Aspects Associated with Runoff from Urban Growth: A Methodological Approach,
W76-09749 4C

RUNOFF FORECASTING

Identification of Linear Systems Response by Parametric Programing,
W76-09575 2E

RURAL AREAS

Problems and Solutions in Estimating the Demand for and Value of Rural Outdoor Recreation,
W76-09633 6D

SACRAMENTO RIVER (CALIF)

Forecasts for the Sacremento River System,
W76-09967 2E

SACRAMENTO-SAN JOAQUIN DELTA (CALIF)

Results of Salinity Tests on the San Francisco Bay-Delta Hydraulic Model,
W76-09978 2L

SAHEL

The Sahelian Drought and Its Demographic Implications,
W76-09486 6G

SALINE SOILS

Water Utilization and Soil Salinity: Control in Arid Zone Agriculture,
W76-09482 3C

Effect of an Electric Current on Water Stability of the Structure of Salinized Solonetz, (In Russian),
W76-09804 2G

The Critical Depth of the Level of Soil-Salinizing Ground Waters, (In Russian),
W76-09808 2G

Evaporation from Highly Saline Soils in an Experimental Plot in the Turkmen SSR, (In Russian),
W76-09887 2D

SALINE WATER

Water Utilization and Soil Salinity: Control in Arid Zone Agriculture,
W76-09482 3C

Method and Apparatus for Converting Saline Water to Fresh Water,
W76-09871 3A

SALINITY

Chemistry of Dissolved Inorganic Carbon in Estuarine and Coastal Brackish Waters,
W76-09597 2L

Bottom Deposits of the Kuban Deltaic Limans, (In Russian),
W76-09935 2L

SALMONELLA

Isolation of Salmonella from Sewage and Surface Waters, (In Russian),
W76-09411 5A

Sanitary Effect of Gamma Irradiation on Sewage Sludge,
W76-09527 5D

SALMONIDS

Substitute Chemical Program - Initial Scientific and Minieconomic Review of Captan.
W76-09651 5C

SALONETZ SOILS

Effect of an Electric Current on Water Stability of the Structure of Salinized Solonetz, (In Russian),
W76-09804 2G

SALT MARSHES

Interstitial Protozoa and Algae of Louisiana Salt Marshes,
W76-09593 5C

SALT TOLERANCE

Effects of Flooding and of Irrigation Water Salinity on Eucalyptus Camaldulensis Dehn From Three Seed Sources,
W76-09664 3C

Contribution of Salts to the Water Potential of Woody Plants,
W76-09691 3C

Effect of Water Quality and Management Practices on Some Chemical Properties of Soils,
W76-09926 3C

Salinity Tolerance of Inland Halophytic Vegetation of North America,
W76-09988 3C

SALT-VERDE RIVER BASIN (ARIZ)

Distribution of Ponderosa Pine Forest Densities on the Salt-Verde River Basin,
W76-09477 4A

SALTS
Contribution of Salts to the Water Potential of Woody Plants,
W76-09691 3C

The Critical Depth of the Level of Soil-Salinizing Ground Waters, (In Russian),
W76-09808 2G

SAMALGA PASS (ALAS)
Upwelling Near Samalga Pass,
W76-09585 2L

SAMPLING
Underwater Observations of Gelatinous Zooplankton: Sampling Problems, Feeding Biology, Land Behavior,
W76-09598 5C

Representative Dirty Water Sampling,
W76-09702 5A

Ten Years of Experience with Automatic Pumping-Sediment Samplers,
W76-09843 7B

Development of a Boat and Helicopter Deployable Oil Slick Sampler,
W76-09892 5A

Technique of Water Sampling in Sanitary Investigations of Large Bodies of Water, (In Russian),
W76-09928 5A

Sampling Network Design for Dispersion Verification,
W76-09961 5B

SAN FRANCISCO BAY
Modeling of Three-Dimensional Flows in Estuaries,
W76-09977 2L

Results of Salinity Tests on the San Francisco Bay-Delta Hydraulic Model,
W76-09978 2L

SAND BED FILTERS
Development of a Continuous Inclined Sand Bed Filter,
W76-09668 5D

SAND WAVES

Hydrology and Sedimentation of Bixler Run Basin, Central Pennsylvania,
W76-09830 2J

Mathematical Model of Flow in a Stream-Aquifer System,
W76-09966 2E

SURFACE TENSION
Comparative Study in Measuring Fluid Surface Tension and Fluid Content with the Aid of Electrical Resistance Elements 'In Situ' and in the Laboratory, (In Flemish),
W76-09923 2G

SURFACE WATERS
Appraisal of Water Resources of Northwestern El Paso County, Colorado,
W76-09828 2E

SURFACTANTS
A Simple Physicochemical Method of Detecting Traces of Surfactants in Water,
W76-09927 5A

SURVEYS
Surveys on Radiation-Resistant Asporogenic Bacteria in Natural Environments,
W76-09519 5C

Urban Stormwater Management--Problems, Solutions and Impact: A Summary of Interviews,
W76-09752 4C

SUSPENDED SOLIDS
Method and Apparatus for Rejuvenating a Bed of Granular Filter Medium,
W76-09424 5D

Visual Observation of the Suspended Sediments and Nearshore Ice Signatures in Chesapeake Bay,
W76-09571 2L

Development of a Continuous Inclined Sand Bed Filter,
W76-09668 5D

Representative Dirty Water Sampling,
W76-09702 5A

How to Design Aerated Lagoon Systems to Meet 1977 Effluent Standards,
W76-09703 5D

SUSPENDED SOLIDS

Sampling Network Design for Dispersion Verification,
W76-09961 5B

SUTTER BASIN (CALIF)
A Three-Dimensional Galerkin Finite Element Solution of Flow Through Multiaquifers in Sutter Basin, California,
W76-09562 2F

SWAN RIVER WATERSHED (MINN)
The Contribution of a Water Information System for Environmental Planning in Minnesota,
W76-09753 6G

SWEDEN
On Long-Term Stability of Zooplankton Composition,
W76-09600 5C

SWELLING CLAYS
Volume Changes in Swelling Clays,
W76-09881 2G

SWITZERLAND
Costs and Hygienic Necessity of Sewage Sludge Pasteurization in Switzerland,
W76-09542 5D

SYNERGISM
Synergistic Effects of Airborne Emissions from Nuclear Power Plants,
W76-09503 5A

Gamma Irradiation for Sewage Treatment at US Army Facilities,
W76-09525 5D

SYNTHETIC HYDROLOGY
Disaggregation Models in Hydrology Revisited,
W76-09573 2A

SYSTEMS ANALYSIS
Hydrologic Systems Analysis Model for Generating Runoff Time Series (Hidrologiai) Rendszervizsgalati Modell Vizhozamidoser Eloallitasara (II. RESZ),
W76-09557 2A

Energy Systems: Modeling and Policy Planning,
W76-09608 6A

Joint USA/Japan Project on Global Systems Analysis and Simulation (GLOSAS) of Energy, Resources, and Environmental (ERE) Systems,
W76-09610 6A

TAIWAN
Irrigation Systems in Taiwan: Management of a Decentralized Public Enterprise,
W76-09848 3F

TARBELA RESERVOIR (INDIA)
Sediment Deposition Model for Tarbela Reservoir,
W76-09970 2J

TAUTOG
The Effect of Temperature on the Behavior of Marine Fishes, a Comparison Among Atlantic Mackerel, Scomber Scombrus, Bluefish, Pomatomus Saltatrix, and Tautog, Tautoga Onitis,
W76-09507 5C

TELEVISION INSPECTION
Sewer Inspection: Checking it Out,
W76-09460 8G

TEMPERATURE
Influence De La Temperature Sur La Contamination D'Especes Marines Par Le Fer-59, (Influence of Temperature on the Contamination of Marine Species by Iron-59),
W76-09494 5C

Generation Time, Length of Life, Instar Duration and Frequency of Moulting, and their Relationship to Temperature in Eight Species of Cladocera from the River Thames, Reading,
W76-09658 5C

The Relationship Between Temperature and Duration of Egg Development in Some Epiphytic Cladocera and Copepoda from the River Thames, Reading, with a Discussion of Temperature Functions,
W76-09659 5C

A Study of Rotating-Disc Treatment Units Operating at Different Temperatures,
W76-09674 5D

TEMPERATURE-DEPTH PROBE (UNDERWATER)
An Underwater Temperature-Depth Data Collection Device,
W76-09727 2H

TERTIARY TREATMENT
Crawley Sewage Treatment Works.
W76-09444 5D

Objectives and Costs of Advanced Treatment Techniques for Sewage,
W76-09449 5D

The Water Industry: A Review Relating to Waste Water Treatment,
W76-09454 5D

Value Engineered Sewage Plant Moves Fast,
W76-09672 5D

TETRAMETHYLTHIURAM DISULFIDE
Determination of Tetramethylthiuram Disulfide (TMTD) in Water and Air by Colimetry, (In Russian),
W76-09590 5A

TEXAS
Field Drainage with Manifold Well Points,
W76-09586 5G

Changes in the Sedimentation Characteristics of an Urbanizing Watershed, Dallas and Collin Counties, Texas,
W76-09745 4C

Hydrologic Data for Mountain Creek, Trinity River Basin, Texas, 1974,
W76-09829 7C

Geochemical and Isotopic Analyses of Waters Associated with the Edwards Limestone Aquifer, Central Texas,
W76-09836 2K

Estuarine Ecologic Simulations,
W76-09950 2L

THERMAL EFFECTS
Interaction Mechanisms of Radioactive, Chemical and Thermal Releases from the Nuclear Industry, Methodology for Considering Co-Operative Effects,
W76-09491 5C

THERMAL INSULATION
Economic Analysis of Effluent Guidelines: Insulation Fiberglass Industry.
W76-09780 5G

THERMAL POLLUTION
Combined Effects of Radioactive, Chemical and Thermal Releases to the Environment,
W76-09490 5C

Impact of Thermal and Radioactive Effluents on a Tropical Nearshore Ecosystem,
W76-09492 5C

The Effect of Temperature on the Uptake and Retention of Co 60 and Zn 65 by the Common Shrimp Crangon Crangon (L),
W76-09493 5C

Swedish Studies on Combination Effects of Thermal Discharges in the Aquatic Environment, Some Aspects of Power Plant Siting Policy,
W76-09495 5C

Evaluation of the Thermal Effects of a Nuclear Power Plant,
W76-09496 5C

Biological Effects of Simulated Discharge Plume Entrainment at Indianpoint Nuclear Power Station, Hudson River Estuary, USA,
W76-09497 5C

Effect of Entrainment in Power Station Cooling Systems Studied Using Periphytic Communities,
W76-09498 5C

Discussion of Possible Effects Due to Mixing of Radioactive and Thermal Releases to the Atmosphere from Nuclear Power Plants,
W76-09502 5A

A Site Study of the Multiple Effects of Thermal Releases on the Aquatic Life in an Estuarine Area,
W76-09505 5C

The Effect of Temperature on the Behavior of Marine Fishes, a Comparison Among Atlantic Mackerel, Scomber Scombrus, Bluefish, Pomatomus Saltatrix, and Tautog, Tautoga Onitis,
W76-09507 5C

Effecto De La Temperatura De Aclimatacion Sobre La Proliferacion De Precursores Eritropoyeticos En Carassius Auratus, (The Effect of Acclimation Temperature on Proliferation of Erythropoietic Precursors in Carrassius Auratus and on the Uptake of Tritiated Thymidine in Haematopoietic and Intestinal Tissue),
W76-09509 5C

Environmental Responses to Thermal Discharges from the Chesterfield Station, James River, Virginia,
W76-09652 5C

Effects of Shock Temperature on Biological Systems,
W76-09660 5C

Effect of Heated Water Discharge of Thermal and Nuclear Power Plants on Invertebrates of Cooling Ponds, (In Russian),
W76-09811 5C

Temperature Predictions for Offshore Power Plants,
W76-09960 5B

THERMAL POWERPLANTS
Power Generation in Arizona and Its Environmental Implications,
W76-09485 6B

ERMAL STRESS
Effects of Shock Temperature on Biological Systems,
W76-09660 5C

ERMORADIATION
Treatment of Sewage Sludge with Combinations of Heat and Ionizing Radiation (Thermoradiation),
W76-09523 5D

INNING
Effect of Thinning on the Foliage and Forest Floor Properties of Ponderosa Pine Stands,
W76-09474 4A

IOBACILLUS THIOOXIDANS
Studies on the Metabolism of a Sulfur-Oxidizing Bacterium. VII. Purification and Characterization of Soluble Components Indispensables for Sulfur Oxidation by Thiobacillus Thiooxidans,
W76-09592 5C

REE-DIMENSIONAL FLOWS
Modeling of Three-Dimensional Flows in Estuaries,
W76-09977 2L

DAL EFFECTS
Operational Model for Predicting the Movement of Oil in Canadian Navigable Waters,
W76-09908 5B

Forecasts for the Sacremento River System,
W76-09967 2E

DAL FLUSHING
Application of Physical Tidal Models in Harbor and Marina Design,
W76-09984 5B

DAL INLETS
Anisotropic Sand Transport in Tidal Inlets,
W76-09955 2L

DAL WATERS
Scope of Tidal Power from Indian Estuaries,
W76-09639 2L

Experience with a Small Scale, Highly Distorted Fixed Bed Model of the Lago Maracaibo Estuary,
W76-09979 2L

ES
Velocity Observations in the West Passage of Narragansett Bay: A Partially Mixed Estuary,
W76-09561 2L

iver Delta Computer Simulation Model (Simudelt),
W76-09954 2L

nisotropic Sand Transport in Tidal Inlets,
W76-09955 2L

E SERIES ANALYSIS
Disaggregation Models in Hydrology Revisited,
W76-09573 2A

DIBUTYL DIISOOCTYLTHIOGLYCOLATE
ygienic Standardization of Tin Dibutyl iisooctylthioglycolate in Water Bodies, (In ussian),
76-09797 5C

POGRAPHY
near Distribution of the High Marsh Vegetaon Communities of the Lower Eastern Shore d its Geological Significance,
76-09570 2L

TOXIC IONS
Sensors for Continuous Monitoring of Toxic Ions, Nutrients, and Dissolved Gases in Water,
W76-09906 5A

TOXICITY
Development of Laboratory Model Ecosystems as Early Warning Elements of Environmental Pollution,
W76-09643 5C

The Role of Bioassays in Environmental Research,
W76-09644 5A

Pathology of Acute Poisoning with the Insecticide Sevin in the Bent-Nosed Clam, Macoma Nasuta,
W76-09649 5C

Substitute Chemical Program - Initial Scientific and Minieconomic Review of Captan.
W76-09651 5C

A Screening Bioassay Using Daphnia Pulex for Refinery Wastes Discharged into Freshwater,
W76-09653 5A

Environmental Quality Research, First Annual Report,
W76-09654 5C

Hygienic Standardization of Tin Dibutyl Diisooctylthioglycolate in Water Bodies, (In Russian),
W76-09797 5C

'Toxic' or 'Poisonous' Water, (In Russian),
W76-09932 5C

Metabolic Cycles for Toxic Elements in Aqueous Systems,
W76-09933 5C

TOXICITY TESTS
Pathology of Acute Poisoning with the Insecticide Sevin in the Bent-Nosed Clam, Macoma Nasuta,
W76-09649 5C

TRACE ELEMENT
Exploration Rock Geochemistry-Detection of Trace Element Halo at Heath Steele Mines (N. B., Canada) by Discriminant Analysis,
W76-09473 2K

TRACE ELEMENTS
Trace-Element Analysis Using X-Ray Emission Spectroscopy,
W76-09697 5A

Sediment Properties, Lake Champlain: 1971-1975,
W76-09763 5B

TRACERS
Steroids in Effluents,
W76-09696 5A

TRAINING
Plankton Analysis Training Manual.
W76-09782 5C

TRAINING MANUALS
Plankton Analysis Training Manual.
W76-09782 5C

TRANSPIRATION
Effectiveness of Water Utilization by Plants, (In Ukranian),
W76-09809 2D

TRANSPIRATION CONTROL
Micro-Climate Effects on Water Use Efficiency by Plants in an Arid Climate,
W76-09480 3B

TREATMENT FACILITIES
Sanitary Waste Treatment Plant,
W76-09414 5D

Who Says Sewage Treatment Plants Have to be Ugly,
W76-09437 5D

Sewage Treatment Facility to be Updated and Expanded at Kitchener Ontario,
W76-09439 5D

Cottonvalley -- Britain's Latest Sewage Works.
W76-09442 5D

Crawley Sewage Treatment Works.

TRICKLE IRRIGATION
Water Utilization and Soil Salinity: Control in Arid Zone Agriculture,
W76-09482 3C

Efficiency of Irrigation Methods for Strawberries,
W76-09897 3F

TRITIUM
Cost Effectiveness of Release Prevention Controls for Tritium and Krypton-85,
W76-09506 5G

TROPHIC LEVEL
Concentration of Cesium-137 in Aquatic Organisms, Water and Bottom Deposits of Water Bodies with a Different Mineral Compositions of the Water, (In Russian),
W76-09410 5C

TROPICAL CYCLONES
Effects of Discharge from a Dredge Spoils Site on Carroll Island, Maryland,
W76-09647 5C

TURBIDIMETERS
Turbidimeter Lights the Way to Accurate Process Control,
W76-09694 5A

TURBIDITY
Effects of Management Practices on Water Quality and Quantity: Penn State Experimental Watersheds,
W76-09463 4D

Forest Management Practices as Related to Nutrient Leaching and Water Quality,
W76-09471 4C

Turbidimeter Lights the Way to Accurate Process Control,
W76-09694 5A

Primary Production in the Frozen Lake Balaton,
W76-09991 5C

TURBOVENTILATORS
The Effluent Lagoons Greifswald-Ladebow (Das Abwasserteichsystem Greifswald-Ladebow),
W76-09682 5D

TURBULENT FLOW
Hydrodynamic Separation of Solids from Solid-Liquid Mixtures,
W76-09716 5D

TURGIDITY
Hydratability as a Parameter of Plant Water Potential, (In French),
W76-09918 2I

TWO-DIMENSIONAL FLOW MODELS
Numerical Two-Dimensional Flow Model for River Systems,
W76-09964 2E

Two-Dimensional Model of Flow Toward Intakes,
W76-09965 2E

ULTRAFILTRATION
Evaluation of Combined Applications of Ultrafiltration and Complexation Capacity Techniques to Natural Waters,
W76-09690 5A

ULTRAVIOLET RADIATION
Practical Application of the Germicidal Power of Ultraviolet Irradiation to Drinking-water, (In French),
W76-09646 5F

UNDERGROUND WASTE DISPOSAL
Numerical Simulation of Waste Movement in Steady Groundwater Flow Systems,
W76-09564 5B

UNDERWATER
Transverse Forces on Vertical Cylinders in Waves,
W76-09583 8B

UNITED STATES
Joint USA/Japan Project on Global Systems Analysis and Simulation (GLOSAS) of Energy, Resources, and Environmental (ERE) Systems,
W76-09610 6A

UPWARD WATER MOVEMENT
Upward Water Movement in Field Cores,
W76-09726 3F

UPWELLING
Upwelling Near Samalga Pass,
W76-09585 2L

URAL RIVER
Biological Production Processes in the Ural River, (In Russian),
W76-09919 5C

URBAN DRAINAGE
Urban Drainage Studies,
W76-09402 5B

ILLUDAS - The Illinois Urban Drainage Area Simulator,
W76-09735 2E

URBAN PLANNING

WATERSHED RUNOFF MODELS
A Review and Analysis of Selected Hydrologic Modeling Concepts,
W76-09718 2E

WATERSHEDS (BASINS)
Summary of Municipal Watershed Management Surveys in Eastern United States,
W76-09466 4D

Conceptual Hydrological Model for an Averaged-Sized Catchment Area, I. Concepts and Relationships,
W76-09579 2A

Conceptual Hydrological Model for an Average-Sized Catchment Area, II. Estimate of Parameters, Validity of Model, Application,
W76-09580 2A

Estimating Selected Parameters for the Kentucky Watershed Model from Watershed Characteristics,
W76-09852 2A

Parameter Optimization for Watershed Models,
W76-09853 2A

WAVE SPECTRA
Modeling of Wind-Waves with Jonswap Spectra,
W76-09948 8B

WAVES (WATER)
Transverse Forces on Vertical Cylinders in Waves,
W76-09583 8B

Probability Distributions of Breaking Wave Heights Emphasizing the Utilization of the Jonswap Spectrum,
W76-09721 2L

The Wind Drift and Wave Breaking,
W76-09724 2L

Wave Breaking in the Presence of Wind Drift and Swell,
W76-09874 2L

Origin, Effect and Suppression of Secondary Waves,
W76-09878 2J

Hybrid-Element Method for Water Waves,
W76-09945 8B

Large Wave Channel for 'Full Scale-Modeling' of Wave Dynamics in Surf Zones,
W76-09946 8B

Wave Motions in an Offshore Harbor,
W76-09947 8B

Modeling of Wind-Waves with Jonswap Spectra,
W76-09948 8B

WELL DESIGN
Monitoring Wells,
W76-09558 4B

WEST GERMANY
Accuracy of Reservoir Inflow Forecasts Based on Radar Rainfall Measurements,
W76-09574 2B

WEST VIRGINIA
Changes in Water Chemistry Resulting from Surface-Mining of Coal on Four West Virginia Watersheds,
W76-09470 4C

WETTING FRONTS
Stability Analysis of Infiltration,
W76-09588 2G

WHITE ROCK CREEK (TEX)
Changes in the Sedimentation Characteristics of an Urbanizing Watershed, Dallas and Collin Counties, Texas,
W76-09745 4C

WHITE ROCK LAKE (TEX)
Changes in the Sedimentation Characteristics of an Urbanizing Watershed, Dallas and Collin Counties, Texas,
W76-09745 4C

WHITEFISH
Feeding Habits of the Population of Whitefish (Coregonus Lavaretus (L.)) in Haugatjern: A Eutrophic Norwegian Lake,
W76-09882 2H

WILDLIFE
Pesticide and PCB Residue in Organs of Wild Animals as Indicators of Environmental Contamination, (In German),
W76-09922 5A

WIND DRIFT
The Wind Drift and Wave Breaking,
W76-09724 2L

WINDS
The Wind Drift and Wave Breaking,
W76-09724 2L

Wave Breaking in the Presence of Wind Drift and Swell,
W76-09874 2L

WINTER
St. Lawrence Seaway: A New Goal of Year-Round Navigation,
W76-09942 2C

WISCONSIN
An Application of the Storm Water Management Model,
W76-09738 5D

WITHDRAWAL
The Over-Exploitation of Groundwater Resources in Dry Regions,
W76-09479 4B

WOOL FIBERGLASS INDUSTRY
Economic Analysis of Effluent Guidelines: Insulation Fiberglass Industry.
W76-09780 5G

WYOMING
Hydrology of the Madison Formation and its Potential use for Water Supply for Energy Development,
W76-09757 2F

Water-Resources Investigations of the U.S. Geological Survey in the Major Coal and Oil Shale Areas of Wyoming, 1975-76,
W76-09833 4A

X-RAY ANALYSIS
Trace-Element Analysis Using X-Ray Emission Spectroscopy,
W76-09697 5A

X-RAY SPECTROSCOPY
Trace-Element Analysis Using X-Ray Emission Spectroscopy,
W76-09697 5A

XEROPHYTES
Micro-Climate Effects on Water Use Efficiency by Plants in an Arid Climate,
W76-09480 3B

ZIMMERMAN PROCESS
Industrial Experience of Sewage Sludge Processing with Zimpro Installations in the Netherlands,
W76-09709 5D

ZINC
Environmental Pollution by Cadmium and Zinc Discharged from a Braun Tube Factory, (In Japanese)
W76-09405 5B

ZN-65
Cycling of Fe55 and Zn65 in Columbia River Carp Following Reactor Shutdown,
W76-09508 5C

ZOOPLANKTON
Underwater Observations of Gelatinous Zooplankton: Sampling Problems, Feeding Biology, Land Behavior,
W76-09598 5C

On Long-Term Stability of Zooplankton Composition,
W76-09600 5C

Environmental Responses to Thermal Discharges from the Chesterfield Station, James River, Virginia,
W76-09652 5C

Acid-Iron Waste as a Factor Affecting the Distribution and Abundance of Zooplankton in the New York Bight: I. Laboratory Studies on the Effects of Acid Waste on Copepods,
W76-09700 5C

AUTHOR INDEX

AAGAARD, K.
Upwelling Near Samalga Pass,
W76-09585 2L

LIBRARY U. OF I. URBANA-CHAMPAIGN

CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey.

- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

Supported by the Environmental Protection Agency in cooperation with WRSIC

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

SELECTED WATER RESOURCES ABSTRACTS

VOLUME 9, NUMBER 19
OCTOBER 1, 1976

W76-10001 -- W76-10404
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates are: SWRA Journal only, $75 ($95 foreign); Journal and Annual Indexes, $100 ($125 foreign); Indexes only, $50 ($65 foreign).

Some documents abstracted in this journal can be purchased from NTIS at prices shown in the entry; prices subject to change. Other documents are available from originating organizations or authors as indicated in the citation.

LIBRARY U. S. D. I. ENDANA-SAMOA

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 9, NUMBER 19
OCTOBER 1, 1976

W76-10001 -- W76-10404

e Secretary of the U.S. Department of the Interior has de-
mined that the publication of this periodical is necessary in the
nsaction of the public business required by law of this Depart-
ment. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

FOREWORD

Selected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into 10 fields and 60 groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

Selected Water Resources Abstracts is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes.

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection.

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION

CANADIAN PARTICIPATION IN THE INTERNATIONAL HYDROLOGICAL DECADE, FINAL REPORT, (VOLUME 2), RESEARCH REPORTS.
International Hydrological Decade, Ottawa (Ontario). Canadian National Committee.
Research Reports, Inland Waters Directorate, Environment Canada, Ottawa, Canada, 240 p, append.

Descriptors: *International Hydrological Decade, *Canada, *Research and development, *Programs, Hydrology, Surface runoff, Groundwater, Lakes, Geomorphology, Snow, Ice, Glaciers, Water quality, Surface waters, Meteorology, Education, Soils, Publications, Information exchange.
Identifiers: *Research projects, International Cooperation.

The International Hydrological Decade (IHD) 1965-1974, was launched by the General Conference of UNESCO at its 13th session to promote international cooperation in research and studies, and the training of specialists, in scientific hydrology. Promotion of collaboration in advancing hydrological research techniques, disseminating hydrological data and planning hydrological installations were features of the IHD program. Highlights of research projects conducted in Canada under the IHD program are outlined. (Environment Canada).

INFORMATION BOOKLET FOR ICEREF, THE BIBLIOGRAPHY OF CANADIAN GLACIERS, GLACIER INVENTORY NOTE NO. 8,
Department of the Environment, Ottawa (Canada). Inland Waters Directorate.
C. S. L. Ommanney, and J. W. Clarkson.
Report Series No. 27, 1973, 123 p.

Descriptors: *Glaciers, *Bibliographies, Ice, Snow, Avalanches, Permafrost, Geomorphology, Sea ice, Lake ice, Icebergs, Water temperature, Depth, Measurement, Water balance, *Canada.
Identifiers: Weighting factors, Ice crystals, Atmospheric ice, Ground ice, River ice, Energy balance, Glacier fluctuations.

A description is presented of the procedures to be followed in listing references, for inclusion in ICEREF, the Bibliography of Canadian Glaciers, by author, date, title and source. A list of the Index Concepts or key words, used to describe the references, is given. Retrieval and sorting are possible on all or any of these Index Concepts so that bibliographies may be prepared for a single author, for a glacier, for a region or for a particular subject matter; restrictions may be imposed by the use of weighting factors. Samples of the output obtained, based on some 400 entries to date, are given. The Monitor List, a mirror image of the punched card input, is used for cross-referencing and corrections. The General Index demonstrates the sorting capabilities available. The Thesaurus contains all the Index Concepts used, and, thus, is an indication of the approved vocabulary. Part (1) describes the various parts of the Data Sheet and gives instructions for coding and the use of weighting factors. Part (2) contains an updated version of the Thesaurus. Part (3) lists the American Society for Testing and Materials (ASTM) CODEN for most of the journals likely to be searched. Part (4) contains a complete list of all Canadian Glacier names, their inventory number, if available, and their location, as well as the names of glaciers from several other countries. A list of glacier types has been appended to Part (4) to aid coders in the comparison of other glacier classifications with that recommended by UNESCO/IASH for the glacier inventory. (Environment Canada)

APPROACH TO GLACIER MASS-BALANCE ANALYSIS UTILIZING TERRAIN CHARACTERIZATION,
Department of the Environment, Ottawa (Canada). Inland Waters Directorate.
G. J. Young.
Water Resources Branch, Scientific Series No. 60, 1976, 34 p. 11 fig., 41 ref., 2 tab.

Descriptors: *Glaciers, *Measurement, *Mass, Water resources, Maps, Hydrology, Snow, Basins, Depth snowmelt, Data, Snowpacks, Ablation, Methodology, *Canada, Terrain analysis, Computer programs.
Identifiers: Terrain, Snow accumulation, Data analysis, *Glacier mass-balance analysis.

A description is presented of a method currently being used to produce accumulation, ablation, and net balance maps as part of the mass balance studies on selected glaciers in Western Canada. The method uses associations between snow depth and terrain geometry to extrapolate the measurements made at sampling locations to unvisited parts of the glacier. The grid square technique has proved very efficient for computer manipulation of data bases and for calculations and tabulations of results. The rationale behind the method and instructions for implementation, including a program listing, are presented. Although the system has been developed for Canadian Cordilleran conditions, the approach could be used with equal success on glaciers with substantially different surface geometry characteristics. (Environment Canada)

A MODEL OF WATER CONTENT AND EVAPORATION FOR HARDWOOD LEAF LITTER,
Western Carolina Univ., Cullowhee, N.C. Dept. of Biology.
A. Moore, and W. T. Swank.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, p 58-69. 3 fig, 1 tab, 21 ref, (CONF-740513).

Descriptors: *Evaporation, *Model studies, *Hydrologic aspects, Litter, Deciduous forests, North Carolina.
Identifiers: *Forest litter, Coweeta Watershed(NC).

A predictive model of water content and evaporative losses in the litter of a mixed deciduous forest is described. The model uses readily obtainable data on total daily incoming solar radiation, rainfall, mean daytime temperature, and mean daytime relative humidity. The model also requires data on site latitude, slope, and aspect; initial litter accumulation; annual quantity and timing of leaf fall; and transmission of solar radiation through the canopy. Three hydrologic compartments are defined--atmosphere, litter, and soil--and one biomass compartment--the litter dry weight. Only two of the intercompartmental flows are modeled--evaporation from litter to atmosphere and drainage from litter to soil. Evaporation rates are calculated from a modified Penman formula but are limited by the vapor conductivity of the litter. The model incorporates throughfall and litter-decay functions. Model performance was tested against independent data collected at the Coweeta Hydrologic Laboratory, North Carolina. The simulated evaporation over 8- and 12-day periods in summer and winter agreed with measured evaporation to within 13%. Daily values of litter water content were usually within the error limits of experimental data. Simulated evaporation and litter water content over an 80-day period also showed good agreement with experimental data. (See also W76-10266) (Auen-Wisconsin)

WATER EXPENDITURE ON TRANSPIRATION BY PLANTS COMMUNITIES DOMINANT IN EASTERN KARA KUM, (IN RUSSIAN),
P. D. Gunin, and V. P. Dedkov.
'Probl Osvoeniya Pustyn'. 3, p 58-61, 1974.

Descriptors: *Transpiration, Plant populations, *Desert plants, *Shrubs, Seasonal, *Evapotranspiration.
Identifiers: Ephedra-strobilacea, Haloxylon-aphyllum, Haloxylon-persicum, *USSR(Kara Kum).

Observations were made on the intensity of transpiration of the dominant desert shrubs (USSR). Haloxylon persicum, H. aphyllum and Ephedra strobilacea show the most intense transpiration. The rate of evapotranspiration was calculated with respect to total night transpiration. In Haloxylon aphyllum communities, the intensity of transpiration in summer exceeds that in H. persicum communities, 1895 m3/ha and 237 m3/ha, respectively.--Copyright 1975, Biological Abstracts, Inc.

MINIMIZATION OF CORE REQUIRED IN ROUTING THROUGH A CHANNEL NEWTWORK,
Hydrocomp International, Palo Alto, Calif.
J-J. Heler.
Simulation Network Newsletter, (Hydrocomp), Vol. 7, No. 7, p 1-8, October 1, 1975. 16 fig, 2 ref.

Descriptors: *Analytical techniques, *Computer models, *Data storage and retrieval, Computers, *Simulation analysis, Channel flow, Routing, Reach(Streams).
Identifiers: Tree structures.

A method has been discussed for decreasing the computer core requirement for simulation of channel networks for a simple case of flow routing. Most natural watersheds are arranged in networks, which are arbitrary sets of channels, reservoirs, and diversion points logically connected in a tree structure. The tree structure is divided into reaches which are computational elements receiving inflow and producing outflow. The order of the reaches upstream from a given point does not matter, when using a routing algorithm. For each reach of the network, a routing algorithm assembles the cumulated outflows from all tributaries, computes the local inflows, and computes outflows. Before these computations are made on any reach, they must be made on all of its tributaries. Within this requirement there are several ways to analyze a tree structure, with varying requirements for computer data storage. One such method, 'Theseus traversing', involves starting with the leftmost reach that has no tributaries and proceeding downstream as far as possible, then moving to the next reach to the right with no tributaries and proceeding downstream as far as possible. When the tree structure is properly ordered, this method requires the least computer data storage. The optimum way to order the tributaries is to sort them according to the order. A reach with no tributaries has order 0; a reach with one tributary has order one and other reaches have the same order as their tributary with the highest order or an order higher by one if two tributaries both have the highest order. A formula is given for determining the core requirement in terms of buffers needed to analyze a tree structure with a given number of reaches. These methods are also applicable to quality constitutents and sediment routing, but only in tree structures. (Snyder-FIRL)

RESULTS OF INFILTRATION TESTS NEAR SCOTT CITY, WESTERN KANSAS,
Geological Survey, Lawrence, Kans.
J. B. Gillespie, and G. D. Hargadine.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-252 242, $4.00 in paper copy, $2.25 in microfiche. Water-Resources Investigations 76-12, April 1976. 29 p, 22 fig, 5 tab, 18 ref.

Descriptors: *Infiltration rates, *Soils, *Loess, *Infiltrometers, *Kansas, Methodology, Data collections, Soil properties, Soil structure, Hydraulic conductivity, Instrumentation.
Identifiers: Western Kansas, Richfield soil.

The purpose of this investigation was to evaluate the infiltrometer as a reconnaissance tool for estimating long-term infiltration rates of water into the loessial soils of western Kansas. Infiltration rates determined from the different types of ring infiltrometers were not consistent, but the tests showed that substantial quantities of water could infiltrate the Richfield soil. Average daily infiltration rates in the soil ranged from 3 to 5 feet using 22-inch ring infiltrometers; 2.3 feet using a 10-inch ring infiltrometer; and from 1.3 to 2.2 feet using double-ring infiltrometers. By comparison, the average daily infiltration rate in the loess using a 10-inch ring infiltrometer was about 13 feet. Laboratory tests of a soil core indicated that the lowest hydraulic conductivity was in the depth interval from 3.9 to 8.6 inches. Soil in this interval, which coincides with the depth of cultivation, evidently limits the rate of infiltration. Air-permeability tests of the unsaturated zone indicated low hydraulic conductivities of 1.9 and 0.2 feet per day for the depth intervals from 0 to 5 feet and 57 to 75 feet respectively. The conductivity of the lower interval probably would create a perched water table during prolonged infiltration. (Woodard-USGS)

Agronomy Journal, Vol. 68, No. 1, p 63-66, January-February, 1976. 2 fig, 1 tab, 11 ref.

Descriptors: *Soil-water-plant relationships, *Diffusion, *Soil water movement, *Nitrogen, *Nitrates, *Root systems, Transpiration, Nutrient requirements, Model studies, Flow, Moisture content, Absorption, Model studies, Path of pollutants, Corn(Field).
Identifiers: Mass flow, *Nitrate-nitrogen.

A model for estimating nitrate-nitrogen uptake by plant roots is developed and its application discussed. Soil and plant parameters which must be known in order to predict transport by diffusion and mass flow include volumetric soil water content, NO3-N concentration in soil solution, porous diffusion coefficient of soil NO3-N, average soil water macroscopic velocity at the plant root surface, root radius, transpiration rate and plant root length. A previously reported steady-state model for simultaneous mass flow and diffusion is evaluated with reference to measurement of those parameters. The importance of diffusion to mass flow is great when the ratio of transpiration rate to the constant of proportionality relating flux into the plant to NO3-N concentration in soil solution is less than 0.2. Hawaii Univ., Honolulu. Water Resources Research Center.
E. D. H. Cheng.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-255 184, $4.50 in paper copy, $2.25 in microfiche. Technical Report No. 92, June 1975. 44 p, 14 fig, 28 ref, append. OWRT A-035-HI(1), 14-31-0001-3811, 14-31-0001-4011, 14-31-0001-5011.

Descriptors: *Finite element analysis, *Infiltration, *Hawaii, *Numerical analysis, Equations, *Soil moisture, Moisture content, Model studies, Soil profiles, Diffusivity, Hydraulic conductivity, *Soil water movement.
Identifiers: *Hawaiian Latosols, Continuous System Modeling Program, *Moisture profiles(Soils), *Moisture diffusivity(Soils).

In attempting to numerically solve the nonlinear moisture flow equation, the Galerkin process, which bears a great similarity to direct methods of the calculus of variations, and the Continuous System Modeling Program (CSMP) approach have been employed. In the finite element formulation of the governing equation, systems of nonlinear algebraic equations were developed on the basis of linear two-dimensional triangular element. These nonlinear algebraic equations were solved simultaneously, at each step, by a programmed logic of iterations. In the CSMP approach, Boltzmann's function application and layered soils formulation were employed in obtaining horizontal and vertical moisture profiles. The second and third degrees of polynomial interpretations of moisture diffusivity, D(theta), and hydraulic conductivity K(theta), of the media were conducted. However, it was established that the former representation had only very limited applicability (as far as some Hawaiian soils are concerned) because a second degree polynomial can accurately describe the D(theta) and K(theta) functions only of the wetter portion of the D(theta) and K(theta) vs. moisture content, Theta, curves. The finite element, CSMP, and finite difference solutions were investigated and compared for Wahiawa soils with lateral moisture movement. Vertical moisture profiles for the Molokoi soils and Tantalus silty clay loams were also investigated by means of the finite element method and the CSMP approach, respectively.

Nauchno-Issledovatelskii Institut Ovoshchnogo Khozyaistva, Moscow (USSR).
V. A. Shtern.
Biol Nauki (Mosc). 18(3), p 110-116, 1976.

Descriptors: *Soil-water-plant relationships, Groundwater, *Soil moisture, Analysis, Moisture content, Irrigation effects, Nitrogen, Iron, Potassium, Manganese, Fertilizers, *Flood plains.
Identifiers: Ramensk, *Moscow River(USSR).

The groundwater level on fields of the Ramensk Sovkhoz in the floodplain of the Moscow River (USSR) drops by the end of the growing season. The maximum soil mositure content was noted at a high groundwater level and the minimum at a low level. The weather conditions and irrigation cause substantial changes of soil moisture. At maximum soil moisture content the content of N, Fe and K compounds increases, and at a low moisture content it decreases. The use of mineral fertilizer with Mo on the soil increases the content of mobile N, K, Fe and Mn compounds. The content of these elements in the soil depends on the amount of ferrous oxide in the soil and uptake of these elements by plants.--Copyright 1976, Biological Abstracts, Inc.

EFFECT OF TILLAGE ON SOIL STRUCTURE AND PLANT GROWTH UNDER RAIN-FED CONDITIONS,
Indian Agricultural Research Inst., New Delhi.
S. Mallick, and Y. N. Nagarajarao.
Indian J Agric Sci. 42(9), p 827-831, 1972.

Descriptors: *Soil-water-plant relationships, *Soil compaction, Compaction, *Corn(Field), Crops, Analysis, *Cultivation, *Chiselling, *Deep tillage, Farm management, Crop response, Rain water, Loam, *Plant growth.

Under rain-fed conditions on a sandy-loam soil on which maize (Zea mas L.) was grown, chiseling, plowing with a moldboard plow, discing, and plowing with a local (desi) plow were compared for tillage efficiency. The depth-wise root distribution was determined at flowering. The bulk density at various stages of growth, moisture-retention characteristics at flowering, hydraulic conductivity at compacted minimum bulk density, settling percentage and aggregation at harvesting stage were determined. The yield differences were statistically significant. Chiseling gave the highest yield. Positive correlations existed between yield and quantity of roots and also available moisture in the subsoil, both being highest under chiseling. The bulk density very rapidly returned to the original value with heavy showers after plowing. The hydraulic conductivity at compacted minimum bulk density followed the root-distribution pattern. Chiseling increased the settling percentage at lower depth, and the aggregation

decreased. Planting of deep-rooted crops and deep placement of fertilizers help build up stable soil structure in the subsoil.--Copyright 1974, Biological Abstracts, Inc.

POPULATION CHARACTERISTICS OF A SPECIES ENSEMBLE OF WATERBOATMEN (CORIXIDAE),
Rochester Univ., N. Y. Dept. of Biology.
C. A. Istock.
Ecology 54(3), p 535-544, 1973.

Descriptors: *Spatial distribution, *Ponds, Michigan, *Temporal distribution, *Growth rates, Breeding.
Identifiers: Competition, *Corixidae, Hesperocorixa-lobata, Sigara-macropala, *Waterboatmen.

The spatial and temporal distributions of 12 spp. of waterboatmen in a 1.2 ha pond in Northern Michigan were studied for 3 consecutive summers. Enclosure experiments involving the growth of 1, 2, and 3 corixid species were performed to test for interspecies competitive interactions and to determine whether the dominant species reach the upper limits to population growth. The experimental data indicate that interspecific competition between the 2 dominant species, Hesperocoriza lobata and Sigara macropala, in enclosures led to a significant reduction in the population size of H. lobata but not of S. macropala. From the enclosure experiments it appears that H. lobata failed to grow to its maximum limit because of competition, while S. macropala did reach its limit, at least in late summer. The experiments also showed that the early summer and late summer breeding habits of H. lobata and S. macropala, respectively, are not physiologically (genetically) fixed properties of these species. It is suggested that the corixid species ensemble here studied may be characterized as 2 sets of ecological homologues: 1 set of Hesperocorixa species that breeds early in the summer and 1 set of Sigara species that breeds later.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: Algae, *Competition, *Crustaceans, Daphnia, Bacteria, Detritus, *Predation, Mortality, Aquatic animals.
Identifiers: Carbon-14, Chaoborus, *Daphnia-parvula, *Holopedium-gibberum.

Two cladocerans, Daphnia parvula and Holopedium gibberum, were studied to determine whether the species were competing and whether the observed coexistence was predictable from competitive relationships alone. Experimental manipulations of intra- and inter-specific competition using 14C-labeled algae, bacteria, and detritus revealed clear competitive effects only with algae. Some resource partitioning was demonstrated. A model was proposed specifying Holopedium to be the poorer competitor for mutually shared resources, but also to be less reliant on those mutual resources, owing to its larger niche. This model predicts coexistence and a higher relative abundance for Holopedium. However, the dynamics of field populations did not correspond to this prediction. Daphnia was rare and declining throughout the study whereas Holopedium exhibited a prenounced burst of growth. Analysis of birth and death processes revealed that Holopedium was relatively free from mortality throughout most of the study, while Daphnia suffered death rates of 20% day or higher. This differential mortality explains the discrepancy between the competition model and observed densities. Finally, field studies indicated that mortality of Daphnia owing to predation by Chaoborus larvae is more than twice that of Holopedium. Daphnia and Holopedium could coexist in a purely competitive system; however, because of selective predation, their observed abundances correspond little to their competitive status.--Copyright 1973, Biological Abstracts, Inc.

ANOMALOUS DIURNAL PATTERNS OF STEM XYLEM WATER POTENTIALS IN LARREA TRIDENTATA,
New Mexico State Univ., University Park. Dept. of Biology.
J. P. Syvertsen, G. L. Cunningham, and T. V. Feather.
Ecology, Vol. 56, No. 6, p 1423-1428, Autumn 1975. 1 tab, 7 fig, 18 ref.

Descriptors: *Soil-water-plant relationships, *Creosote, *Xylem, *Soil water movement, *Soil moisture, New Mexico, Water vapor, Transpira-

tion, Soil profiles, Root zone, Stemflow, Thermocline, Soil temperature, Shrubs.

At a study area in northeast Dona Ana County, New Mexico, diurnal stem xylem water potentials of Larrea tridentata (DC.) Cov. were measured with a pressure chamber during the summers of 1973 and 1974. Plants growing in dry soils had minimum water potentials at night and maximum values during the day, possibly due to vertical water vapor movements in the soil profile in response to temperature gradients. Water vapor apparently moves up from the rooting zone at night and drops again during the day. This process probably enhances the ability of Larrea shrubs to maintain photosynthetic activity when soil water potentials are low. Daily stem xylem water potentials may exceed the predawn value by as much as 35 bars and reach midday levels similar to well-watered plants. Midday values will probably begin exceeding predawn values when the latter fall to between -32 and -43 bars; this range is likely to vary according to soil type and climatic conditions. (Jahns-Arizona)

TECHNIQUES FOR IMPROVING TREE SURVIVAL AND GROWTH IN SEMIARID AREAS,
Agricultural Research Service, Manhattan, Kans.
J. D. Dickerson, N. P. Woodruff, and E. E. Banbury.
Journal of Soil and Water Conservation, Vol. 31, No. 2, p 63-66, March-April, 1976. 3 fig, 4 tab, 38 ref.

Descriptors: *Scotch pine trees, *Juniper trees, *Plant growth, Soil-water-plant relationships, *Semiarid climates, Environmental effects, Microenvironment, Water harvesting, Irrigation effects, Mulching, Water management(Applied), Windbreaks.
Identifiers: *Redcedar trees(Juniperus virginia), *Tree survival, Snowfence protection, Shade treatment, Soil profile modification.

Seven techniques were tested for supplying more water or altering the microclimate of eastern redcedar (Juniperus Virginiana) and Scotch pine (Pinus sylvestris) planting sites to improve survival and growth. Water-harvesting treatments (50 x 100 and 50 x 50 feet areas) provided 40 and 30 percent more redcedar growth than the control; drip irrigation and snowfence protection improved growth by 35 and 33 percent respectively. Survival increased with those techniques and with shade treatment, the latter having no positive influence on growth. Scotch pines responded less to the same treatments but survived and grew best with snowfence protection and drip irrigation. Soil profile modification and mulch plot treatments were unsuccessful; no Scotch pines survived under those techniques. Results indicate that trees in semiarid regions can be brought more rapidly to effective wind-barrier heights. (Jahns-Arizona)

EFFECT OF LOW MOISTURE LEVEL ON CATALASE ACTIVITY IN SOME CROP PLANTS DURING JUVENILE PHASE,
Gujarat Univ., Ahmedabad (India). Botany Div.
A. B. Vora, H. C. Patel, A. V. Vyas, B. R. Patel, and J. A. Patel.
Annals of Arid Zone, Vol. 14, No. 3, p 229-234, September 1975. 3 tab, 14 ref.

Descriptors: *Moisture stress, *Germination, *Crops, *Soil-water-plant relationships, *Plant tissues, Corn(Field), Plant physiology, Enzymes, Embryonic growth stage, Water requirements, Seeds, Legumes.
Identifiers: *Catalase activity.

After seeds of maize (Cv. Ganga 5), gram (Cv. Chafa) and Sesamum (Cv. Patan 64) were germinated under 'adequate' and 'low' moisture levels, catalase activity was determined in the growing axis and in maize endosperm, gram cotyledons, and Sesamum seedlings every 24 hours for 4 days. Low moisture levels caused catalase activity declines in the growing axis of maize and gram seedlings and gram cotyledon, while the endosperm enzymic activity of maize was unaffected. Enzymic activity of Sesamum seedlings increased at 24 and 72 hours and decreased at 48 hours of germination. The embryo axis of adequately watered seedlings showed greatly increased catalase activity for 72 hours followed by a decline. At a low moisture level, catalase activity remained low until a sharp rise occurred approaching 96 hours. Activity was much greater in the axis than the cotyledon, but low moisture levels depressed both. (Jahns-Arizona)

YIELD-NUTRIENT ABSORPTION RELATIONSHIPS AS AFFECTED BY ENVIRONMENTAL GROWTH FACTORS,
National Fertilizer Development Center, Muscle Shoals, Ala.
G. L. Terman, F. E. Khasawneh, S. E. Allen, and O. P. Engelstad.
Agronomy Journal, Vol. 68, No. 1, p 107-111, January-February, 1976. 7 fig, 17 ref.

Descriptors: *Plant growth, *Nutrients, *Crop production, *Soil temperature, *Soil environment, Nitrogen, Phosphorus, Corn(Field), Oats, Growth rates, Root development, Soil management, Crop response, Absorption.

Temperature effects on crop yield-nutrient concentration and uptake relationships were evaluated in three greenhouse pot experiments and as reported in the literature on such factors. Several rates of applied nitrogen and phosphorus were compared in experiments on oats grown for 7 weeks at three combinations of day length and temperature; corn grown for 4 weeks at water bath temperatures of 16 and 27C; and corn grown for 3 and 6 weeks to compare P rates and temperatures of 16 and 21 C and at ambient temperatures (25 to 35C). Plant nutrient concentrations, especially of P, increase with greater soil temperatures in short-duration experiments, with little yield response to temperature. Where marked yield response occurs, dilution of plant nutrient concentrations but higher uptake are the dominant trends with temperature increases up to the optimum for each crop species; the opposite trend usually occurs at temperatures above the optimum. Substrate nutrient release under higher temperatures varies with the soil fertility level and amounts of applied nutrients. Root growth rate is probably important in uptake, especially with nutrients having limited mobility in the soil. (Jahns-Arizona)

INTERACTION OF WATER POTENTIAL AND TEMPERATURE EFFECTS ON GERMINATION OF THREE SEMI-ARID PLANT SPECIES,
Commonwealth Scientific and Industrial Research Organization, Wembley (Australia). Div. of Land Resources Management.
M. L. Sharma.
Agronomy Journal, Vol. 68, No. 2, p 390-394, March-April, 1976. 2 fig, 1 tab, 16 ref.

Descriptors: *Osmotic pressure, *Germination, *Temperature, *Soil moisture, Planting management, Semiarid climates, Environmental effects, Moisture stress, Thermal stress, *Australia, Grasses, Shrubs, Viability.
Identifiers: *Water potential, *Matric potential, *Osmotic potential, New South Wales.

The interactive effects of temperature with matric and osmotic potential on the germination of Danthonia caespitosa, Atriplex nummularia and A. vesicaria are reported. The rate and total germination of all three dryland species from New South Wales decreased as water potential declined. Germination rates increased with increasing temperature, but final germinations were greatest at intermediate temperatures (20 - 25 C). Low water potentials during optimum temperatures produced the best germination. Osmotic and matric potential effects were qualitatively similar, but osmotic inhibition decreased at low temperatures. Both Atriplex germinated at extreme temperatures (5 and 40 C), while D. caespitosa failed to germinate. At low water potential (-15 bars) A. nummularia germinated from 15 to 40 C and D. caespitosa at 25C, while A. vesicaria germinated poorly at all temperatures. A. nummularia had the greatest resistance to environmental stress. Atriplex spp may germinate after rains during summer as well as winter; Danthonia germination is likely only during spring and autumn. (Jahns-Arizona)

Descriptors: Suspended solids, Seasonal, Productivity, Rivers.
Identifiers: Biological studies, *USSR(Azov Sea).

On the basis of seasonal observations the main sources of suspended material in the Azov Sea (due to shore abrasion, disintegration of bottom rocks and discharge of the Don and Kuban Rivers) were determined and their seasonal dynamics traced. A pattern of quantitative distribution and dependence on hydrologic conditions, biological productivity and intensity of shore abrasion, and evacuation of materials by the Don and Kuban Rivers was established.--Copyright 1975, Biological Abstracts, Inc.

THE SIMULATION OF SEDIMENT TRANSPORT,
Hydrocomp, Inc., Palo Alto, Calif.
K. M. Leytham.
Simulation Network Newsletter, (Hydrocomp), Vol. 7, No. 8, p 1-8, November 15, 1975. 4 fig, 9 ref.

Descriptors: *Analytical techniques, *Simulation analysis, *Clays, *Sands, *Silts, Sediments, Mathmatical models, Model studies, Runoff, Natural streams, Scour, *Sediment transport.

A deterministic, fixed bed stream sediment transport model has been developed which accepts inputs of water and sediment from the land surface hhase as modeled by the Agricultural Runoff Management (ARM) Model. A kinematic wave technique is used to simulate flows in the system. Interchange of suspended material with stream bed material, scour and aggradation, the effect of armoring on scour rates, and longitudinal dispersion due to variations in velocity are the major sediment processes represented. Sediment outflow from a channel reach is first approximated by assuming slug flow but the estimate is later adjusted to allow for longitudinal dispersion and changes in sediment concentration with time. It is assumed that all the sand, some silt, and a small portion of the clay settle out during the modeling interval. Steady state transport rates for cohesionless materials are converted to scour rates by assuming that ultimate steady state concentrations would be achieved by the end of each modeling interval. The model includes additional algorithms for beds containing cohesive clay and silt materials. Armoring, an effect in which immobile, cohesionless particles protect the particles under them from scour, is included in the model. The algorithms for settling and scour are used to calculate a new concentration which, together with the initial concentration assumed for slug flow, is used to calculate the sediment outflow. Identifiers: Pocillopora-meandrina-var-nobilis, Trapezia-digitalis, Trapezia-ferruginea, Trapezia-flavomaculata, Trapezia-intermedia, Trapezia-wardi, Xanthid crabs.

In Hawaii 5 species of xanthid crabs of the genus Trapezia (T. intermedia, T. wardi, T. ferruginea, T. digitalis, T. flavomaculata) are commensals of the branching coral Pocillopora meandrina var. nobilis. As adults, crabs are found in heterosexual pairs. Intraspecific agonistic interactions typically restrict host occupancy to one pair per species, but multiple species combinations are common. Though niche overlap among the species is nearly complete, they exhibit statistically different host size requirements. Field observations suggested that the distribution patterns of the species are influenced by interference competition during host selection. A stochastic computer model of host selection produced species distributions similar to those observed in the field. In the absence of evidence consistent with alternative hypotheses, this suggests that interference competition resulting from random encounters during host selection by adults is sufficient to account for site variability in the distribution patterns of species of Trapezia. Simulation experiments were conducted to assess the relative importance of the potential sources of competitive pressure to each species of Trapezia. The suitability of the hosts available at each study site to each species was estimated (1) assuming the presence of competitors and (2) assuming the hosts were uncolonized. The decrease in suitability of the hosts due to the presence of competitors was used as an index of competitive pressure on the species. There was no significant correlation between the degree of niche overlap and the intensity of competition between species. Caution is advised in using niche overlap measurements to estimate competition intensity.--Copyright 1973, Biological Abstracts, Inc.

Descriptors: *Salinity, *Rivers, Water levels, Benthos, Isolation, Fish, Spawning, Bays, Plankton, Shallow water, Methodology, Spatial distribution.
Identifiers: *USSR(Don Rivermouth).

A method is proposed for isolating the runoff-dependent component of salinity in the shallow offshore zone of the Don River (USSR), free of the effect of wind-induced fluctuations of the water level. The runoff-dependent salinity can differ from the actual (measured) salinity at a given point of the offshore zone by more than 3.0%. The route of Don River waters in Taganrog bay (Azov Sea) is defined, explaining the specific characteristics of the spatial distribution of a number of hydrochemical indices and of some biological characteristics (plankton benthos, fry of fish spawning in the Don, etc.).--Copyright 1975, Biological Abstracts, Inc.

TESTS ON THE EQUILIBRIUM PROBILES OF MODEL BEACHES AND THE EFFECTS OF GRAIN SHAPE AND SIZE DISTRIBUTION,
Tetra Tech, Inc., Pasadena, Calif.
J. I. Collins, and C. B. Chesnutt.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 907-926, 1975. 13 fig, 3 tab, 25 ref. Army DACW72-72-C-0024.

Descriptors: *Beaches, *Model studies, *Hydraulic models, Sediment transport, Sediments, Sands, Erosion, Beach erosion, Sedimentation, Deposition(Sediments), Geomorphology, Waves(Water), Ocean waves, Particle size.
Identifiers: *Movable-bed models.

This study was conducted to investigate the effects of the model sediment size distribution and particle shape in movable-bed models. Secondly, an experimental evaluation of the scale model relationship was performed. The results showed that the effects of grain shape and size distribution are varied. For many cases there was little or no measurable effect, but in others, particularly for smaller wave steepnesses, marked differences were apparent. These included the appearance of multiple bars in the case of bimodal sediment size distribution and an instable bar in the cases of very narrow unimodal size distributions and for some cases with a spherical grain shape. It was found that the initial profile slope can influence the final stable profile shape. 'Rocklite', a manufactured, light-weight ceramic sediment, appeared to be a potentially useful model material. The attempted verification tests were only partially successful. The slope of the foreshore was reproduced in scale, but the shape of the offshore and surf zones and the movement of the shoreline were not reproduced. (See also W76-10415) (Sims-ISWS)

PHYSICAL MODELING OF SCOUR INITIATION AND SEDIMENT TRANSPORT IN DISTORTED TIDAL MODELS,
Florida Univ., Gainesville. Dept. of Civil Engineering.
B. A. Christensen, and R. M. Snyder.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 927-935, 1975. 1 fig, 8 ref. NOAA 04-5-158-44.

Descriptors: *Scour, *Sediment transport, *Model studies, *Hydraulic models, Particle size, Roughness(Hydraulic), Estuaries, Inland waterways, Erosion, Sedimentation, Hydraulics.
Identifiers: *Movable-bed models.

While the construction and operation of undistorted fixed bed Froude models of hydraulic structures (such as spillways, intakes, guide vanes, etc.) generally do not present substantial problems, this is not the case when models of entire waterways, estuarine regions, and coastal

areas are considered. The horizontal extension of such flow systems combined with the need for not too small depths in the model require the operation of distorted models with artificial roughness elements introduced to distort the slope of the energy grade line correctly. Formulas for the size and distribution of these roughness elements were developed and tested in a tidal model of the canal between Little Lake Worth and Lake Worth in Palm Beach County, Florida. Furthermore grain-size model scales which will allow true modeling of scour initiation and sediment transport were developed for lighter than prototype model bed materials, thereby avoiding too small model grain-size. TIME GROWTH OF TIDAL DUNES IN A PHYSICAL MODEL,
Queen's Univ., Kingston, Ontario. Dept. of Civil Engineering.
M. S. Yalin, and W. A. Price.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 936-944, 1975. 2 fig, 6 ref.

Descriptors: *Sediment transport, *Dunes, *Model studies, Mathematical models, Hydraulic models, Tidal effects, Particle size, Ripple marks, Sand waves, Sands, Erosion, Sedimentation, Tides, Estuaries.

A method was suggested to determine the scale of the duration of the development of dunes forming on the bed of a tranquil flow. It was expected that the scale relations determined should be applicable to both unidirectional and tidal flows. The derivation rested on dimensional principles as well as on a mathematical relation describing the duration of development as a certain function of the geometric dimensions of dunes in their developed state, and a typical transport rate. The treatment was two-dimensional, the granular material being cohesionless. It was assumed that the movable bed of the model is formed by either sand or a lightweight material. The application of the method was illustrated by a numerical example. (See also W76-10415) (Sims-ISWS)

LABORATORY EFFECTS IN COASTAL MOVABLE-BED MODELS,
Coastal Engineering Research Center, Fort Belvoir, Va.
C. B. Chesnutt.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 945-961, 1975. 9 fig, 1 tab, 8 ref.

Descriptors: *Beaches, *Sediment transport, *Model studies, *Hydraulic models, Sands, Sediments, Coasts, Shores, Estuaries, Waves(Water), Ocean waves, Erosion, Sedimentation.
Identifiers: *Movable-bed models.

Profile changes were measured during three lengthy experiments in a 6-ft wide by 3-ft deep by 107-ft long outdoor wave tank, with a piston wave generator at one end and a movable bed of 0.2-mm sand at the other end. Generator period (1.90 sec), water depth (2.33 ft), and nominal wave height (0.36 ft) were constant in the three experimnts. The controlled experimental variables were the initial test length (distance from the wave generator to the initial still water level intercept) and the initial profile slope. The water temperature was uncontrolled. The average shoreline recession rate (which governed the rate of profile development) varied from 0.02 to 0.10 ft/hr during the first 50 hours of the three experiments. The differences in recession rate were apparently the result of water temperature variations and/or the differences in initial test length. Trasiet and final profile shapes appeared to be affected by the initial profile slope. (See also W76-10415) (Sims-ISWS)

SIMULATION OF DELTA BUILDING PROCESS,
Central Water and Power Research Station, Poona (India).
S. V. Chitale, V. G. Galgali, and K. N. Appukuttan.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 962-973, 1975. 4 fig, 1 tab. 3 ref.

Descriptors: *Deltas, *Sedimentation, *Model studies, *Hydraulic models, Rivers, Dams, Reservoirs, Sediments, Suspended solids, Sedimentation rates, Deposition(Sediments), Reservoir silting, Silting, Sedimentology.
Identifiers: *India, *Movable-bed models, *Beas River(India), *Pandoh Dam(India).

A rockfill dam of height 200 feet above the river bed is under construction on Beas river at Pandoh for diverting waters to the Bhakra reservoir on river Sutlej through a long water conductor system. The Beas river has a steep slope of about 1 in 200. After construction of the dam it is expected that the river would ultimately get completely silted up to the crest of the spillway. Model investigations were carried out to attempt scaler reproduction of the formation of sediment delta and of the conditions obtaining after final silting of the reservoir which were considered critical for sediment entry into the intake for diversion of the Beas supplies into the Sutlej. At the end of 10th cycle, the sediment inflow and the outflow equilized, indicating the stability of the delta. It was also observed that the slope of the stabilized delta was more or less same as the original bed slope of the river allowing for changes in the cross sectional flow area at higher elevations. MOVABLE-BED MODEL INVESTIGATION OF TAICHUNG HARBOR, TAIWAN, REP. OF CHINA,
Florida Univ., Gainesville. Dept. of Civil Engineering.
H-S. Hou, B. A. Christensen, and T. Y. Chiu.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, Calfornia, September 3-5, 1975. American Society of Civil Engineers, New York, p 974-992, 1975. 21 fig, 3 tab, 1 ref.

Descriptors: *Harbors, *Littoral drift, *Model studies, Hydraulic models, Sediment transport, Ocean waves, Waves(Water), Sedimentation, Silting, Coasts, Beaches, Sands.
Identifiers: *Movable-bed models, *Taiwan, *Taichung Harbor(Taiwan).

The paper describes the establishment and operation of a distorted movable-bed model of Taichung Harbor located on the west coast of Taiwan where sand migration from the littoral drift, partially nourished by the Ta-Chia River, makes extensive dredging necessary to keep the harbor inlet channel open. The model employed is a three-dimensional movable-bed Froude model for all prototype depths less than 50 m. At depths in excess of this value the influence of sediment transport is considered negligible and a fixed-bed is used. The objective of the model study was to investigate the performance of various outer breakwater configurations and to select the optimum configuration which will stabilize the harbor inlet channel, i.e., protect it from excessive shoaling caused by the seasonal wave action and the littoral drift. The wave used in the model corresponds to a wave of 5 m in height and 12 seconds in period from a northerly direction. The optimum breakwater configuration was determined such that dredging of the harbor inlet will not be necessary during the first 15 years of the structures lifetime. After this period of time has elapsed minor yearly dredgings are expected to be needed. (See also W76-10415) (Sims - ISWS)

COASTAL MOBILE BED MODEL - DOES IT WORK,
Queen's Univ., Kingston (Ontario). Dept. of Civil Engineering.
J. W. Kamphuis.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 993-1009, 1975. 2 fig, 1 tab, 27 ref, 2 append.

Descriptors: *Coasts, *Beaches, *Model studies, *Hydraulic models, Sands, Littoral drift, Erosion, Sedimentation, Sediment transport, Particle size, Geomorphology, Tracers, Coastal engineering.
Identifiers: *Movable-bed models.

After a number of years of study, coastal mobile bed models were classified and scale effects resulting from various non-similarities were discussed. Two methods of classification were given - one according to non-similarity of basic scaling relationships and another according to the type of model required. All but one class of model is subject to substantial scale effect and thus no easy scaling recipes can be given. Modelling still remains an art and this extensive study only results in pointing out some common pitfalls to be avoided. Models using lightweight material were shown to be eminently unsuitable for inshore areas and it appears to be virtually impossible to determine time scales for bed morphology because of scale effect. The simple tracer model appears to yield best value for money invested. (See also W76-10415) (Sims -ISWS)

MULTILAYER HYDRODYNAMICAL-NUMERICAL MODELS,
Naval Environmental Prediction Research Facility, Monterey, Calif.
T. Laevastu.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1010-1025, 1975. 6 fig.

Descriptors: *Coasts, *Hydrodynamics, *Model studies, Coastal engineering, Tides, Winds, Currents(Water), Ocean currents, Mathematical models, Computer models, Path of pollutants, Waves(Water), Estuaries, Beaches, Erosion, Deposition(Sediments), Sedimentation.

The basic hydrodynamical formulas were solved with an explicit finite difference method of Hansen. The layers (up to five layers in the existing model) are vertically integrated. The upper layer is driven by tides, winds, and thermohaline gradients. The lower layers are coupled with internal friction, as well as with horizontal and vertical density gradients. The model uses a staggered grid (Hansen type), actual depths, and coastline. The tides and 'permanent thermohaline currents' were introduced at the selected open boundaries. The surface wind was specified at each time step.

Verification and tuning of the model was done with tide gage data or curtent recordings in one or more locations within the area which have not been used for open boundary input. The basic outputs of the model at desired time intervals are: sea level, actual depth, and currents. Various other subroutines have been added to the models, which give: transport and diffusion of pollutants, drift of objects, and transport of water through various sections (flushing). Some examples and verifications were shown together with some specific applications of the results to coastal engineering and water management problems. (See also W76-10415) (Sims - ISWS)

MULTI-PHASED MODEL STUDY OF THE SETO INLAND SEA,
Chugoku Inst., of Industrial Technology, Kure (Japan). Hydraulic Research Section II.
N. Hayakawa, T. Higo, H. Tanabe, Y. Takasugi, and M. Takarada.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1026-1041, 1975. 6 fig, 2 tab, 2 ref.

Descriptors: *Model studies, *Bays, *Estuaries, Mathematical models, Hydraulic models, Tides, Sea level, Circulation, Water circulation, Water pollution, Currents(Water), Flow, Tidal waters.
Identifiers: *Seto Inland Sea(Japan), *Japan.

The Seto Inland Sea of Japan, with an area of about 21,400 sq km and greatly complicated topography, is plagued by water pollution problems due to heavy concentration of population and industry in the surrounding area. Reported here was an endeavor to develop both hydraulic and mathematical models of an enormous size with the ultimate goal of predicting water pollution in the Sea. Much effort was spent to counter the size and complex geometry of the model. Results of the verification study and some associated problems were described. (See also W76-10415) (Sims - ISWS)

TIDAL RESIDUAL CIRCULATIONS IN THE HYDRAULIC MODEL,
Ehime Univ., Matsuyama (Japan). Dept. of Ocean Engineering.
H. Higuchi, T. Sugimoto, H. Ueshima, T. Yanagi, and H. Yasuda.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1042-1049, 1975. 9 fig, 3 ref.

Descriptors: *Model studies, *Bays, *Estuaries, Hydraulic models, Tides, Sea level, Circulation, Water circulation, Water pollution, Currents(Water), Flow, Tidal waters, Coasts.
Identifiers: *Hinchi-Nada Sea(Japan), *Seto Inland Sea(Japan), *Japan.

The tidal residual circulation induced by the coastal boundary geometry of the bay is studied mainly by use of a hydraulic model experiment. The theoretical suggestion that these circulations are formed by the rotation of the non-linear effect of the tidal currents was verified, and the process was made more clear. These circulations have great importance for local distributions of substances as well as water exchange of the bay. They are similarly reproduced in the model when the non-dimensional parameters, Froude number and Reynolds numbers, are made to coincide between the model and the prototype. MODELING OF TURBULENCE IN THE SURF ZONE,
Technische Hogeschool, Delft(Netherlands). Dept. of Civil Engineering.
J. A. Battjes.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1050-1061, 1975. 16 ref.

Descriptors: *Surf, *Ocean waves, *Turbulence, *Model studies, Mathematical models, Coasts, Shores, Beaches, Energy dissipation, Energy loss, Waves(Water).

The problem dealt with was the estimation of the horizontal turbulent momentum exchange in the surf zone. In contrast to previous models, the relevant properties were estimated taking account of the wave energy dissipation by breaking. The resultant expression for the turbulent energy dissipation, combined with an analysis of the interaction of the turbulent velocity field with the rate of strain in the longshore current, led to estimates of the turbulence intensity, its macro-length-scale, and its contribution to the momentum exchange. The latter appeared in a form similar to that in the common eddy-viscosity models, although this had not been assumed a priori. The coefficients in the resultant expression, while of necessity adjustable, are expected to be of order unity. (See also W76-10415) (Sims-ISWS)

NEARSHORE WATER CIRCULATION INDUCED BY WIND AND WAVES,
Delaware Univ., Newark. Dept. of Civil Engineering.
W. A. Birkemeier, and R. A. Dalrymple.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1062-1081, 1975. 12 fig, 13 ref. ONR N00014-69-A-0407.

Descriptors: *Waves(Water), *Winds, *Beaches, *Model studies, Mathematical models, Coasts, Shores, Wind tides, Ocean waves, Surf, Seiches, Circulation, Water circulation, Harbors, Estuaries.

A finite difference model for time-dependent, wave-induced nearshore circulation has been developed which includes wave refraction, wave-current interaction, wave setup, wind effects, and coastal flooding. Results were shown for set-up in wave tanks due to steady waves and wave groups, and also for a longshore periodic beach. Important results were that tuned wave groups can incite seiching in enclosed basins and harbors and that rip currents will be induced or maintained by the presence of surf zone channels. NUMERICAL MODEL FOR WAVE REFRACTION BY FINITE AMPLITUDE WAVE THEORIES,
California State Univ., Long Beach. Dept. of Civil Engineering.
H-L. Chu.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1082-1100, 1975. 6 fig, 11 ref, 2 append.

Descriptors: *Model studies, *Waves(Water), *Refraction(Water waves), Mathematical models, Computer models, Ocean waves, Equations.
Identifiers: Wave rays, Small amplitude waves, Stokes' third order waves, Cnoidal waves.

A mathematical model applying the concept of finite amplitude surface waves for computing and plotting wave refraction diagrams was presented. The important wave parameters considered in the model were wave height, wave period, and bottom contours. For the construction of the model, equations governing the wave ray curvature for a depth gradient of unit (defined as the curvature coefficient) were derived separately for the small amplitude waves, the Stokes' third order waves, and the cnoidal waves. The equations were also presented graphically, showing the regions of applicability for each theory and regions' overlap. Application of the model was demonstrated on a symmetrical shape submarine valley using a set of 12-second period waves with initial wave heights of 0 feet, 5 feet and 10 feet, respectively. Results in the form of wave refraction diagrams from the finite amplitude model were presented and were compared with those obtained from the small amplitude model. As the initial wave height to depth ratio H/d increased, refraction of wave rays subsided, which indicated that the small amplitude wave refraction model tended to overestimate the refraction. Even for waves of relatively small initial H/d ratio the differences in refraction patterns between the results from the small amplitude and those from the finite amplitude models were significant. Identifiers: *The Netherlands, *North Sea.

In engineering studies for the Delta project, two-dimensional tidal computations were used in conjunction with hydraulic models for the prediction of tide levels and currents in the estuaries of the Rhine and Scheldt and adjacent sections of the Southern North Sea. A detailed field survey of tide levels and currents near Goeree, which was made to assess changes in tide levels and currents as a result of the closure of one of the branches of the Rhine estuary, made it possible to compute the time histories of all terms of the momentum equation at a few locations. During the survey, simultaneous current measurements were made at 16 stations over a 13-hour period. The velocities and direction were measured in the vertical at several locations. From this data the vertically-averaged velocities and directions were computed. In addition, at a large number of stations the tide levels

were measured. Float measurements were made also. From the analysis of this data it was concluded that, in hydraulic models of areas with flow conditions similar to those investigated, and at the same latitude, the effect of the earth's rotation should be simulated. If two-dimensional tidal computations of such areas are made, the advection terms should not be neglected in the computation, as the contribution of these terms is significant in the determination of the flow field. Descriptors: *Model studies, *Estuaries, *Hydraulic models, *Mathematical models, Reviews, Rivers, Sediment transport, Flow, Sea water, Freshwater, Salinity, Water quality.
Identifiers: Model scales, Scale effects, Model verification.

A very brief discussion is presented of similitude relations, selection of model scales, and scale effects for distorted-scale, fixed-bed physical models of estuaries. The problems susceptible to model analysis were enumerated. The advantages and disadvantages of employing physical models were discussed, including a cursory comparison with numerical models. The purpose and methods for model verification were discussed and verification test results were presented from several typical models. An emergency study in the Delaware River model to determine the rate of saltwater advancement up the estuary during the 1965 drought was described. A study of shoaling in Brunswick Harbor was also presented. The recommended improvement plan has been constructed in the field and data were presented for comparison with the model predictions. The cost savings effected by a dike rehabilitation study in the Delaware River model were also presented. (See also W76-10415) (Sims-ISWS)

COMPARISON BETWEEN PHYSICAL AND MATHEMATICAL MODELLING OF A TIDAL FJORD SYSTEM IN NORTHERN NORWAY,
Trondheim Univ. (Norway). Vassdrags- og Havnelaboratoriet.
T. Audunson, J. P. Mathisen, H. Naeser, and T. McClimans.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1291-1310, 1975. 13 fig, 1 tab, 10 ref.

Descriptors: *Model studies, *Fjords, *Tidal waters, Mathematical models, Hydraulic models, On-site investigations, Tides, Inlets(Waterways), Coasts, Currents(Water), Circulation, Water circulation, Diffusion, Tracers, Hydraulics, Hydrodynamics.
Identifiers: *Norway.

Results were presented from a physical and numerical model study of a tidal fjord system with three tidal inlets in northern Norway. The velocity field in the distorted physical model was shown to be in good agreement with available field data. The tidal velocity fields computed from a two-dimensional vertically integrated numerical model showed fair agreement with observations from the physical model. The computations showed little effect from the earth rotation. Stability of the numerical calculations required the incorporation of a diffusion term in the equations of motion. Numerical computations of spreading and dilution of tracer material employed a vertically integrated two-dimensional diffusion-advection model. In these computations use was made of the solution of the equations of motion. The numerical results were compared to similar results from the physical model. Agreement was found at some locations, disagreement at others. Diffusion effects in the distorted physical model seems larger than what was obtained in the numerical computations. The results strongly emphasized the importance of adequate data for comparison with numerical computations before such models may be used with confidence. (See also W76-10415) (Sims-ISWS)

COMPARISON OF HYDRAULIC AND NUMERICAL TIDAL MODELS,
Naval Postgraduate School, Monterey, Calif. Dept. of Oceanography.
E. B. Thornton, and L. S. Romer.
In: Symposium on Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1311-1328, 1975. 5 fig, 10 ref.

Descriptors: *Model studies, *Bays, *Tidal waters, Mathematical models, Hydraulic models, Tides, Tidal effects, Currents(Water), Circulation, Water circulation, Estuaries, Inlets(Waterways), Hydraulics, Hydrodynamics.
Identifiers: *San Diego Bay(Calif).

A comparison was made of the merits and limitations of hydraulic and numerical models. The discussion was limited to models having uniform density over depth and the driving force is the tide only. The model comparison was for San Diego Bay. Prototype measurements were used to calibrate both models. Comparable results were obtained from the hydraulic and numerical models dependent on how well they were calibrated. Techniques were described to divide large arrays representing embayments in the numerical model into smaller segments that are handled more easily and faster in the computer. This technique can allow using finer mesh lengths to obtain better spatial resolution. (See also W76-10415) (Sims-ISWS)

MODELING SEDIMENT DEPOSITION IN A TIDAL RIVER,
Dames and Moore, Cranford, N.J.
J. I. Ordonez.
In: Symposium on Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1347-1368, 1975. 8 fig, 10 ref.

Descriptors: *Model studies, *Estuaries, *Deposition(Sediments), Computer models, Sediment transport, Rivers, Tidal waters, Tidal streams, Sediments, Sedimentation, Intakes, Flow, Mathematical models, California.
Identifiers: *Sacramento River(Calif).

A computer modeling technique was developed to study the extent and depth of sediment deposits in tidal rivers downstream from a local source of oversupply of sediment. The model describes the deposits as one-dimensional deltas of uniform height moving in the flow direction according to the varying transport capacity of the river at different discharges and bed elevations. The model incorporates a reorganization of the hydraulic computations in the Einstein Method, for sediment transport calculations in alluvial rivers, to permit the determination of the sediment transport capacity of a given channel with a given discharge, when the depth or velocity in the reach are known. The new procedure does not require a knowledge of the friction slope and is particularly suited for the computation of transport capacities in gradually varied unsteady flow where the hydraulic conditions can be represented by a series of uniform flows during discrete intervals of time. COMPUTER SIMULATION OF BEACH EROSION AND PROFILE MODIFICATION DUE TO WAVES,
Delaware Univ., Newark. Dept. of Civil Engineering.
H. Wang, R. A. Dalrymple, and J. C. Shiau.
In: Symposium on Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1369-1384, 1975. 9 fig, 10 ref.

Descriptors: *Model studies, *Beach erosion, *Waves(Water), Computer models, Mathematical models, Littoral drift, Sediment transport, Erosion, Sedimentation, Suspended solids, Tidal effects, Tides, Beaches, Coasts.

The phenomenon of beach erosion has become important in recent years as the coastline has become a focus of human activity. In order that adequate planning in the coastal zone be possible, it is necessary to understand and to model the evolving coastline. A computer model has been developed to predict coastal erosion as a function of input deepwater wave conditions, tidal conditions, and the nearshore present bathymetry. The model predicts sediment transport in the offshore zone due to transport of material by the wave-induced mass transport and in the surf zone, caused primarily by the longshore current. Examples of the capabilities of the model were presented, including the modification of the beach profile with time due to the uneven littoral drift across the surf zone and the alteration of an irregular shoreline with time due to wave and tidal effects. FLOW2D: A TWO-DIMENSIONAL FLOW MODEL FOR FLOOD PLAINS AND ESTUARIES,
Resource Analysis, Inc., Cambridge, Mass.
G. J. Vicens, B. M. Harley, and J. C. Schaake, Jr.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1487-1504, 1975. 6 fig, 4 ref.

Descriptors: *Model studies, *Floods, *Flood plains, *Estuaries, Mathematical models, Finite element analysis, Water levels, Flow, Flood flow, Streamflow, Hydrographs, Hydrology, *Puerto Rico.

In a variety of flood plains and estuaries a one-dimensional analysis of the water movement is inappropriate. For these cases a Two-Dimensional Flow Model (FLOW2D) has been developed. FLOW2D numerically solves the equations of continuity and momentum in finite element form to predict stages and discharges throughout the area of interest. The continuity equation relates the rate of change in water surface elevation to the net rate of instantaneous flow into a segment. A flood plain or estuary is divided into a number of segments. The input data required are: minimum, median, and maximum elevations within each segment; segment size; cross-section descriptions for the boundaries between segments; Manning's n for each of these cross-sections; and flow or water surface hydrographs at the external boundaries. A unique feature of this model, which seeks to minimize the cost of simulation runs while maintaining strict control of the accuracy of the solutions, is a variable time step. Through the use of filter/prediction techniques, the model internally reduces the time step when sharp changes in water surface elevations are occuring. In this manner a more 'detailed' description of these changes is obtained. On the other hand, where no such variations are present, the model increases the time step so as to minimize the cost of the solution. This model has been used to estimate flood elevations in a variety of flood plains in Puerto Rico. In those basins where observed flood elevations were available, the simulated results were in close agreement. (See also W76-10415) (Sims-ISWS)

NUMERICAL MODEL FOR STORM SURGE AND TIDAL RUN-UP STUDIES,
Dames and Moore, Los Angeles, Calif. Advance Technology Group.
A. K. Runchal.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1516-1534, 1975. 7 fig, 10 ref.

Descriptors: *Model studies, *Storm surge, *Tidal waters, Mathematical models, Mud flats, Tidal marshes, Beaches, Reservoirs, Winds, Pressure, Friction, Coriolis force, Waves(Water), Algorithms, Flow, Water circulation, Numerical analysis, Simulation analysis.
Identifiers: *Tidal run-up.

The mathematical and numerical basis of a computational model developed for study of run-up and draw-down on tidal flats was described. The model is based upon the 'shallow water' theory and accounts for the presence of coriolis force, basin friction, wind stresses, and pressure gradients. The mathematical model is pseudo-two-dimensional in nature in that the gradients of the variables are assumed negligible in a direction normal to that of the main concern. The resulting algorithm is especially efficient and economical. Unlike many other numerical algorithms, the present one was found to be especially suited for preserving the characteristic wave speeds and amplitudes of the solution. It has been tested with a number of trial problems and found to provide results which accord well with the available approximate or analytic solutions. (See also W76-10415) (Sims-ISWS)

NUMERICAL SIMULATION OF STORM SURGES IN BAYS,
Danish Hydraulic Inst., Horsholm.
A. Damsgaard, and A. F. Dinsmore.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1535-1551, 1975. 9 fig, 2 tab, 4 ref.

Descriptors: *Model studies, *Storm surge, *Coasts, *Florida, Mathematical models, Hurricanes, Storms, Winds, Waves(Water), Floods, Flood plains, Bays, Estuaries, Barrier islands, Tides, Wind tides, Numerical analysis, Simulation analysis.
Identifiers: *Biscayne Bay(Fla), *Hurricane Betsy.

A two-stage approach for numerical simulation of storm surges in complex coastal areas has been adopted by the Danish Hydraulic Institute. The first stage simulates the open coast surge on a large and relatively coarse model including enough area that the surge is generated entirely within the model. The second stage routes the open coast surge into the nearshore area and superimposes the locally generated surge on top of the open coast surge. This method is particularly suited to simulation of surges in such complex areas as bays and estuaries partly sheltered by barrier reefs, low-lying barrier islands, which might be overtopped at some stage during the surge, and inundated flood plains. It has been applied to design hurricane simulations in Biscayne Bay, Florida, and Darwin, Australia, among other locations. Both model stages are based on DHI's computer system 'System 21' which computes the flows and water levels in a model of the area under study using a finite difference method for solution of the equations of continuity and momentum for nearly-horizontal two-dimensional flows. The area may be of quite arbitrary shape and bathymetry. (See also W76-10415) (Sims-ISWS)

D. B. King, and O. H. Shemdin.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1623-1637, 1975. 12 fig, 4 ref. ONR NR-388-106 ONR N00014-A-0173-0020

Descriptors: *Model studies, *Inlets(Waterways), *Bays, *Sedimentation, Mathematical models, Channels, Estuaries, Littoral, Rivers, Coasts, Tides, Tidal waters, Sands, Sediment transport, Sediments, Hydraulics.

Models of inlet-bay systems were considered through the use of the equations of motion and continuity. The models include inertia in the inlet, changing cross sectional area in the inlet, changing surface bay area and considers river discharge. Previous analytical models simplify such considerations and predict symmetric flows in and out of inlets over a tidal cycle. The nonlinear friction in the inlet coupled with the above considerations produce asymmetric flows over a tidal cycle of varying degrees. The sediment transport capability of inlets were considered in terms of power of the flow rates. The inlet-bay systems were interpreted in light of their capability to trap sand from the littoral zone. It was found that some inlets behave as sinks and others eject sand to the ocean. This depends on the repletion coefficient as defined by Keulegan and on whether the inlet cross sectional area or bay surface area increase with the tidal elevation as in marsh regions. The sand trapping capability was also investigated in light of the phase shift between the ocean tide and the inlet current. The model results were discussed in light of observations obtained from Florida inlets. (See also W76-10415) (Sims - ISWS)

LCHF COASTAL SEDIMENT MODELING TECHNIQUES,
Laboratoire Central d'Hydraulique de France, Paris.
C. Migniot, C. Orgeron, and F. Biesel.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1638-1657, 1975. 18 fig.

Descriptors: *Model studies, *Coasts, *Sediment transport, Hydraulic models, Analytical techniques, Waves(Water), Currents(Water), Winds, Sands, Erosion, Sedimentation, Harbors, Breakwaters, Structures, Littoral drift, Beaches, Estuaries, Reviews.

Systematic studies of the complex motions induced by waves, currents and wind action have to be made for a large variety of projects including large or recreational harbors and coast protection works. Except for the simplest cases, scale model techniques remain the only reliable and economical means to forecast the effect of a maritime structure on bottom topography and to optimize the layout in order to suppress or minimize unwanted accretion or erosion. For the last thirty years, the Laboratoire Central d'Hydraulique de France (L.C.H.F.) has been developing a scale model technology allowing this kind of research to be carried out with a good accuracy. The present paper sets forth these techniques and shows examples comparing forecasts obtained with models with actual observed evolution. (See also W76-10415) (Sims - ISWS)

COMPOSITE SEMIPERMEABLE MEMBRANES MADE FROM POLYETHYLENIMINE,
Universal Oil Products Company, Des Plaines, Ill. (Assignee).
W. J. Wrasidlo.
U. S. Patent No. 3,951,815, 5 p, 15 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1350, April 20, 1976.

Descriptors: *Patents, *Desalination, *Reverse osmosis, Membranes, Membrane processes, Waste water treatment, *Water pollution treatment, Water quality control, Water purification, Semipermeable membranes, Thin films, Chemical reactions.
Identifiers: Composite semipermeable membranes, Ultrathin films.

The object of the invention is to provide an improved method for making composite semipermeable membranes having good salt rejection characteristics in which membranes are resistant to deterioration. By employing a film-forming polymer having a plurality of reactive amino or hydroxyl groups, and by treating this polymer with a monomer which will cross-link the polymer, rather than react with two groups on the same molecule, ultrathin films can be created which have effective salt-rejecting capability and are thus useful in the creation of composite semipermeable membranes. When polyethylenimine is used, it may first be reacted with an appropriate amount of acrylonitrile under conditions which assure cyanoethylation of substantially all of the primary amino groups or the polyethylenimine may first be cross-linked and then reacted with acrylonitrile or a suitable reactant. This is a standard graft polymerization reaction and is carried out under known conditions. After the cyanothylation is complete, an appropriate water solution of the graft polymer is prepared, and a microporous substrate is soaked in this solution for a sufficient period of time. The reaction of the polyamine with the dicyl halide or some other monomer, is allowed to proceed for an appropriate period of time to assure that cross-linking to the extent desirable is achieved. USE OF SALINE WATER IN AGRICULTURE. I. DESCRIPTION OF THE SYSTEM,
Central Arid Zone Research Inst., Jodhpur (India).
R. P. Dhir, and O. P. Bhatia.
Annals of Arid Zone, Vol. 14, No. 3, p 206-211, September, 1975. 4 tab, 9 ref.

Descriptors: *Saline water, *Irrigation wells, *Irrigation practices, *Water management(Applied), *Arid lands, *Saline water systems, Crop production, Fallowing, Wheat, Barley, Groundwater, Sodium, *Salt tolerance.
Identifiers: *Rajasthan, India(Pali district), Raya, Jowar.

Details are presented of an irrigation system developed in western Rajasthan, India, using saline to highly saline sodic underground waters considered unfit for such purposes by all available water quality standards. Data were collected from 37 sites concerning water and soil characteristics, management practices and duration of well use. Irrigation using saline and sodium well water has increased over the last 50 years in this region; 90-95% of the wells were in use between 1970 and 1973; loam to clayey texture soils, from 60-90 cm deep were most commonly irrigated. Lands irrigated with waters below 5 mmhos are usually double cropped, while those under higher salinity irrigation are used in rotation with a fallow period (generally 18 mo) between applications allowing natural amelioration of soil through rainfall. Wheat is the most popular crop and is sometimes grown with barley; when waters below 5 mmhos are used, raya, jowar and maize are also grown. (Jahns-Arizona)

SEED GERMINATION AND EARLY SEEDLING GROWTH OF WHEAT (TRITICUM AESTIVUM LINN.) CV. 1553 UNDER THE INFLUENCE OF SALINITY AND PLANT-GROWTH HORMONES,
Swami Shradha Nand Coll., Alipur (India).
V. R. Babu, and S. Kumar.
Annals of Arid Zone, Vol. 14, No. 3, p 221-228, September, 1975. 4 tab, 11 ref.

Descriptors: *Seed treatment, *Germination, *Salt tolerance, *Plant growth regulators, *Soil-water-plant relationships, Wheat, Moisture content, Root development, Salinity, Plant growth.
Identifiers: Benzyl adenine, Kinetin, Osmotic stress, India.

Plant hormones benzyl adenine and kinetin promoted wheat seed (Triticum aestivum Linn. cv. 1553) germination and survival under osmotically stressed conditions of soil salt solutions up to 3.5%. The utilization of seed reserves decreased as soil salt concentrations increased. This inhibitory effect could be overcome up to 1% of salt solution by adding benzyl adenine and kinetin. Seedlings survived as long as 8 days in the 2.5 - 3.5% salt concentration range utilizing the assimilates in solution with hormones. The hormones had a corrective influence in seedling dry matter mobilization up to 1.5% soil solutions. Seedling water content also increased. Root and shoot elongation rates under test conditions were comparable to controls grown in distilled water, with hormone-treated seedlings at a 1% salt concentration having a greater shoot elongation than controls. Root elongation rates were higher in salt solutions with benzyl adenine than with kinetin. Increased water content may have been due to enhanced membrane permeability resulting from hormonal influence. (Jahns-Arizona)

GEOTHERMAL POWER METHOD,
J. S. Swearingen.
U.S. Patent No. 3,951,794, 9 p, 3 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1343, April 20, 1976.

Descriptors: *Patents, *Geothermal studies, Thermal properties, *Scaling, *Heat exchangers, Heat transfer, Energy, Suspensions, Suspended solids, Impaired water quality.

The object of this invention is to provide a system and method of extracting heat from hot unrefined water by passing it directly through a conventional heat exchange apparatus. Scaling and other solid build-up of impurities from the water is prevented in the hot water well casing and water transport equipment as well as in the heat exchange equipment. The heat exchanger surface may be the surfaces of a conventional heat exchanger such a tube and shell or they may be the surfaces of the porous material in an accumulator-type heat interchanger. The improvement involves adding to the hot unrefined water an agent capable of increasing the formation of non-scale-forming species of the scale- forming impurities so that scaling and other solid build-up on the heat exchange surface, particularly upon cooling of the water, is minimized. Non-scale-forming species are those which remain in solution or suspension in the unrefined water as it is passed through the heat exchange apparatus without forming scale and/or those which are harmlessly precipitated, e.g. solid non-scale particles which are small enough to remain in suspension in the moving water and be carried out of the heat exchange apparatus. COAL GASIFICATION IN SOUTHEASTERN OHIO: WATER SUPPLY AND DEMAND,
Ohio State Univ., Columbus. Dept. of Civil Engineering.
E. E. Whitlatch, Jr.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-254 836, $5.00 in paper copy, $2.25 in microfiche. Ohio Water Resources Center, Columbus, Project No. 489X, Completion Report, September 1975. 77 p, 53 ref. OWRT A-041-OHIO(1).

Descriptors: *Water requirements, *Consumptive use, *Water supply, *Ohio, *Cost comparisons, Sites, Linear programming, *Optimization, *Energy, *Natural gas, Coal mines, Reservoirs, Groundwater conjunctive use, *Water demand, Optimum development plans, Water transfer, Water values, Solid wastes, Reviews.
Identifiers: *Coal gasification, Southeastern Ohio, High-Btu gas, Low-Btu gas, Synthetic natural gas, Gas transport, Gas cost, Gas supply, Gas demand, Coal supply.

A general review of the need for coal gasification is made at the National level and for the State of Ohio. Current State energy policy promotes the construction of both low and high-Btu coal gasification plants. Water requirements of such an industry are estimated and water availability is determined for Southeastern Ohio. Direct stream use, reservoir and groundwater sources are compared economically. Linear programming optimization models are also developed for the coal gasification siting problem. These incorporate the cost of plants, gas transmission, coal supply and transport, solid waste disposal and water supply. The estimated range of consumptive water use in a 250 million cubic feet per day, high-Btu plant, is from 7 to 45 million gallons per day (MGD). The most likely consumptive water use for such a plant in Southeastern Ohio is 25 MGD. A generalized cost analysis of three alternative water supply sources indicates that a direct stream source would very likely be the least expensive alternative, followed by reservoir and groundwater sources. The respective costs of these were calculated to be 17.9, 25.4, and 27.2 cents per 1000 gallons. At a gas price of $1.50 per 1000 cubic feet, the cost of water would generally represent from 1.2 to 1.8 percent of the final gas price. Mathematical models of the energy facility siting process can be developed and would be useful in the comparison of alternative trade-offs between low-Btu and high-Btu coal gasification plant construction. The Federal government should support a detailed study of water use and conservation in both the Lurgi and advanced technology processes. Site-specific reconnaissance should be carried out in the selected study area for both reservoir sites and potential groundwater aquifers capable of supplying a coal conversion industry.

PUDDLING TROPICAL RICE SOILS: 2. EFFECTS OF WATER LOSSES,
North Carolina State Univ., Raleigh. Dept. of Soil Science.
P. Sanchez.
Soil Sci. 115(4), p 303-308, 1973.

Descriptors: *Puddling, Cultivation, *Rice, Root development, *Plant growth, *Soil-water-plant relationships, Drainage effects, *Water loss, Water harvesting, Crop production, Rotations, Crop response.

The advantages of puddling some tropical rice soils are directly or indirectly related with deceasing water losses and not with increasing nutrient-supplying capacity. Puddled flooded treatments produced similar or higher rice yields than other combinations. The limitations of puddling rice soils are in restricting root development when the soil shrinks and cracks at early stages of rice growth in rainfed systems and the slow waterloss patterns after rice harvest which might limit rotations with other crops. When excessive water movement is not a limiting factor, excellent rice performance can be obtained from well-granulated soils.--Copyright 1973, Biological Abstracts, Inc.

SOLUTION PHOSPHORUS CONCENTRATION AND GROWTH OF RICE (ORYZA SATIVA L.) IN FLOODED SOILS,
Texas Agricultural Experiment Station, College Station. Dept. of Soil and Crop Sciences.
L. R. Hossner, J. A. Freeouf, and B. L. Folsom.
Soil Sci Soc Am Proc 37(3), p 405-408, 1973.

Descriptors: Soil-water-plant relationships, Nutrient requirements, *Phosphorus, *Plant growth, Fertilization, *Crop response, *Rice, Aquatic soils, Gulf coastal plain, Texas, Growth rates, Flooding.
Identifiers: Oryza-sativa, Flooded soils.

Soil solution P concentration was monitored at weekly intervals during the vegetative growth of O. sativa L. cv. 'Bluebelle' on flooded soils from the gulf coast region of Texas. Significant increases in dry matter production were obtained from application of phosphate fertilizer. Average soil solution P concentration ranged 0.02-5.28 ppm when all soils and P fertilization rates were considered. A linear relationship was obtained between the logarithm of the average soil solution P concentration and the P concentration or P uptake of the plant. Yields were greater than 90% of maximum when the average soil solution P concentration was greater than 0.1 ppm. The concentration of P in the plat tissue at 0.1 ppm soil solution P was 0.25%.--Copyright 1973, Biological Abstracts, Inc.

DIFFERENT LEVELS OF SOIL ORGANIC MATTER IN DESERT SOIL AND NITROGEN FERTILIZER ON YIELDS AND MINERAL COMPOSITION OF BARLEY GROWN IN THE SOIL,
California Univ., Los Angeles. Div. of Environmental Biology.
E. M. Romney, A. Wallace, J. W. Cha, and J. D. Childress.
Communications in Soil Science and Plant Analysis, Vol. 7, No. 1, p 51-55, 1976. 2 tab, 9 ref.

Descriptors: *Sierozems, *Soil environment, *Organic matter, *Crop response, *Barley, Soil moisture, Plant growth, Vegetation effects, Fertilizers, Soil types, Plant physiology, Nitrogen, Soil amendments.

Barley plants (Hordeum vulgare L. cultivar Atlas 57) were grown for 30 days in desert soil from bare areas (low soil organic matter) and from beneath long-established shrubs (moderately high soil organic matter). Plants were grown in pots with three replicates, with and without nitrogen fertilizer, watered daily and maintained at near 1/3 bar soil moisture or higher. Those produced in soil from under shrubs had three times greater dry weight than those grown in low organic matter soil with N added. Silicon levels of high organic soil plants were reduced by N fertilizer and were greater in plants from low organic matter soil with and without N. Shoot concentrations of iron, Al and Zn were positively correlated with N concentrations and negatively with those of Si. Mn levels were higher in plants from low soil organic matter; calcium was positively correlated with shoot concentrations of Ba. (Jahns-Arizona)

CENTER-PIVOT IRRIGATION,
W. E. Splinter.
Scientific American, Vol. 234, No. 6, p 90-99, June 1976. 9 fig.

Descriptors: *Irrigation, *Sprinkler irrigation, *Irrigation efficiency, *Pasture management, *Crop production, Land use, Soil moisture, Arid lands, Soil management, Economic feasibility, Irrigation practices, Irrigation systems.
Identifiers: *Center-pivot irrigation.

The center-pivot system involves irrigation of circular fields using a series of sprinklers mounted on a pipe supported by a row of mobile towers and rotated to distribute water supplied by a central well. Sprinklers are spaced so that the water is applied at increasing rates with distance outward along the pipe. The advantages are its automatic

eration on large tracts, minimized application, ign for the quarter section (160 acres) and the lity to irrigate lightly and frequently. The last ture is especially advantageous with coarse or dy soil; moisture in the root zone is replenished ficiently to allow intensive cropping on such ls. Pasture irrigated by this system has proved matically more productive. Fertilizers can be ected into the water supply line to administer rients as needed. Some disadvantages are the stantial energy requirements and possible letion of underground water reservoirs. The nomic potential is analyzed, and some ad- tageous methods of application are presented. hns-Arizona)

scriptors: *Wheat, *Crop response, *Growth es, *Crop production, *Planting management, zona, Water management(Applied), Irrigation ects, Cultivation, Plant growth.

periments at Yuma, Arizona, evaluated effects wheat (Triticum aestivum) production of plant- methods and different cultural practices. Two nting methods (on the flat and on beds), 3 seed- rates (29, 58 and 87 kg/ha) and 4 row positions beds (north, south, east and west) were studied. t and bed methods produced similar wheat in yields and grain volume weights; seeding es had little net effect on those results, although low seeding rate resulted in more wheat seed head and fewer heads/unit area than higher es. Beds with an east-west orientation produced re heads/unit area, more seed/head and higher in yields than those running north-south. The ith row position on east-west beds had better ults than the north position except in seed ight response which was unaffected. Higher ding rates on north-south beds produced heavi- seeds. Row position on north-south beds did not ect head/unit area values and grain yields. sults suggest that wheat grown on north-south ls should have lower seeding rates for economi- production. (Jahns-Arizona)

scriptors: *Nitrates, *Fertilization, *Crop ponse, *Nutrient requirements, *Wheat, izona, Root zone, Crop production, Testing ocedures, Plant tissues, Phosphates.

e effect of N fertilization on the growth and ld of semidwarf spring wheat (Triticum tivum L.) in the Yuma Valley of southwestern izona and a tissue test as guide for applying h fertilizers is presented. Excessive N used is luated, in two field experiments reduced yields htly when compared with sufficient N levels. plication of 336 kg N/ha produced the best lds, with no further increase resulting from her rates. Yields intermediate between control l high-yield results were achieved with 112 and kg/ha rates prior to planting; similar results at se two rates suggest much of the N applied plant was leached from the root zone. N caused reases in number of heads/unit area and seeds/head, with a decrease in the weight of individual seeds. Total N content in the grain increased with larger N applications. Determination of P in the lower portion of wheat stems was of doubtful value in determining the crop's P status. (Jahns-Arizona)

OBSTACLES TO THE DEVELOPMENT OF ARID AND SEMI-ARID ZONES.
Nature and Resources, Vol. 11, No. 4, p 2-11, October-December, 1975. 1 fig.

Descriptors: *Arid lands, *Semiarid climates, *Land development, *Comprehensive planning, *Land use, Livestock, Sheep, Irrigation efficiency, Irrigation effects, Rainfall, Tourism, Human population, Social aspects, Crop production, Salinity, Salt tolerance.

Difficulties of animal husbandry, irrigation, rainfall cultivation, urban growth, industrial development and tourism within arid and semi-arid zones are discussed and some solutions offered. Arid zone problems are somewhat easier to contend with since specific solutions are based on divisionof arid areas into specialized land use units. Semi-arid zone development involves conflict between various methods (agriculture or animal husbandry), and population density increases complicate the decision-making process. Animal husbandry problems include those of climate, over-grazing, over-population, pastoral vs. agricultural orientations, loss of grazing land and livestock marketing complications. Irrigation produces harmful side-effects, salinization, soil cultivation and health factors. Rainfall cultivation is complicated by variable precipitation, erosion, animal husbandry and crop cultivation, and crop rotation. These and other obstacles to arid and semi-arid zone development are described. Proposals for specific management programs are outlined and recent innovations explored. (Jahns-Arizona)

MOISTURE USE EFFICIENCY OF DRYLAND CROPS AS INFLUENCED BY FERTILIZER USE II. RABI CEREALS,
Indian Agricultural Research Inst. New Delhi.
R. P. Singh, and Y. S. Ramakrishna.
Annals of Arid Zone, Vol. 14, No. 3, p 263-267, September, 1975. 1 tab.

Descriptors: *Application methods, *Fertilizers, *Water utilization, *Crop response, *Dry farming, Consumptive use, Water requirements, Nitrogen, Soil-water-plant relationships, Wheat, Barley, Crop production, Agronomy, Water conservation.

A study was conducted for two seasons (1969-70 and 1970-71) at the Indian Agricultural Research Institute, New Delhi, to test the response of wheat (Kalyan Sona) and barley (EB3/Ratna) grown on conserved soil moisture to graded levels of nitrogen (20, 40, 60 and 80 kg N/ha) and three methods of N application (broadcast, placement and 1/2 soil plus 1/2 foliar). Wheat and barley tested had 32-47% greater moisture use efficiency than controls when fertilized with 40 kg N/ha. The half-soil (drilled) plus half-foliar method of fertilizer application produced greater moisture use efficiency with wheat, and both that method and a placement technique were superior to the broadcast method with barley. Exact figures are given for crop response to various levels of nitrogen and application methods, and for total consumptive use, yield of grains, value of grains, and moisture use efficiency. (Jahns-Arizona)

1975 ARIZONA AGRICULTURAL STATISTICS.
Agricultural Research Service, Tucson, Ariz. Statistical Reporting Service.
Arizona Crop and Livestock Reporting Service Bulletin S-11, March, 1976. 71 p, 105 tab, 1 fig.

Descriptors: *Agriculture, *Crop production, *Statistics, *Arizona, *Weather data, *Livestock, *Water supply, *Reservoir yield, Rainfall, Reservoir storage, Soil moisture, Colorado River Basin, Profit.
Identifiers: Gila River Basin(Ariz), Salt River(Ariz).

A compilation of statistics is presented on Arizona agricultural production between 1968 and 1975, a summary of weather, crop and livestock conditions in 1975, and a water supply outlook for the state. Total rainfall for 1975 was below normal at most reporting stations, but a few mountain stations were slightly above average. Estimated crop sales amounted to $607.5 million or 1% below the 1974 level; this decrease was due to lower prices for some crops and reduced quantities in certain cases. Livestock and livestock products brought $618.5 million, or 6% greater than the 1974 total. Reservoir storage totals in the Gila and Colorado River Drainage basins are presented. It is expected that 1976 water supplies will be adequate if normal precipitation continues throughout the season. Heavy rainfall in February accounted for greatly increased flows in the Salt and Gila Rivers. Rain and melting snow have produced good soil moisture at lower and intermediate elevations, and good runoff is expected from normal precipitation in March and April. (Jahns-Arizona)

EFFECT OF WATER REGIME ON PRODUCTIVITY OF CULTIVATED PLANTS, (IN BELORUSSIAN),
R. I. Lashkyevich.
Vyestsi Akad Navuk B SSR Syer Biyal Navuk. 2, p 5-11, 1974.

Descriptors: Productivity, *Moisture content, Peat, *Water tables, Carrots, Corn(Field), *Soil moisture, Cultivation, *Crop production, Peas, Potatoes.
Identifiers: Beets, Cabbage, Peas, Peat, Potatoes.

The results of 16-yr investigations of the effect of the water table and moisture content of peat soils on the yield of agricultural crops are presented. Maintenance of an optimal water table and copious water charging in early spring improved the moisture of the rhizasphere and increased plant productivity even in an area where the groundwater dropped markedly in late summer. Copious moisture in the 1st half of vegetation when the main vegetative mass is formed and much moisture is consumed, considerably improved crop yield. The highest yields of grain crops were obtained at a water table of 50-75 cm, perennial grasses and peas at 50-55 cm, potatoes, carrots and corn at 60-85 cm, and beets and cabbage at 80-105 cm from the soil surface. The optimal water content of peat soil was established: from 75-85% for perennial grasses and from 70-80% for field crops, with its decrease to 70% of the maximum field capacity 30-35 days before harvesting root crops.--Copyright 1975, Biological Abstracts, Inc.

FLOOD PLAIN INFORMATION: CUMBERLAND RIVER, BURKESVILLE, KENTUCKY.
Army Engineer District, Nashville, Tenn.
Prepared for the City of Burkesville and Kentucky Department of Natural Resources, June 1971. 29 p, 5 fig, 7 plates, 6 tab.

Descriptors: *Floods, Flooding, *Flood flow, *River flow, *Flood profiles, *Flood plains, Dams, *Kentucky, Regional flood, Streamflow forecasting, Maximum probable flood, Historic floods, Flood data, Flood frequency, Peak discharge, Flood peak, Flow duration, Snowmelt.
Identifiers: *Cumberland River(KY), Burkesville(KY), Wolf Creek Dam(KY), Intermediate Regional Flood, Standard Project Flood.

Most developed lands subject to flooding in this study area are within the corporate limits of Burkesville. Most land is above flood levels, but there are some commercial and residential developments and a proposed industrial park within the floodway. The Cumberland River drains 17,614 square miles, 6,020 sq mi of this is above Burkesville. Wolf Creek Dam, 34 miles above Burkesville, impounds more than 96% of this drainage area and thus provides excellent protection for Burkesville. Before the dam was finished in 1950 flood stage was exceeded almost once a year but since that time bankfill stage has not been reached. Main periods of potential floods occur in December through April. Records of stream heights in the vicinity of Burkesville are available for years back to 1884, but official data goes back to 1941. The largest flood, in 1826, floated the courthouse out of Burkesville and destroyed many other structures. The highest recent flood occurred in 1946. After building the dam, the highest floodwaters occurred in 1952 when a peak discharge of 57,000 cubic feet per second was recorded. In an Intermediate Regional Flood a peak discharge of 64,000 cfs is expected along with water velocities of up to 5 ft/sec. This flood would last 24 hours. A Standard Project Flood would produce a peak discharge of 90,000 cfs with slightly higher channel velocities. This flood would last about 48 hours, considerably less than floods before Wolf Creek Dam was built. There are no significant obstructions to flood flow within the study reach. (Smith - North Carolina)
W76-10151

FLOOD PLAIN INFORMATION: EAST ARM LITTLE CALUMET RIVER, SALT CREEK-COFFEE CREEK, PORTER COUNTY, INDIANA.
Army Engineer District, Chicago, Ill.
Prepared for the Northwestern Indiana Regional Planning Commission, March 1975. 32 p, 12 fig, 20 plates, 10 tab.

Descriptors: *Floods, *Flooding, Flow characteristics, *Flood protection, *Non-structural alternatives, *Flood plain zoning, Planning, Flood damage, Floodways, Flood plains, Obstructions to flow, *Indiana.
Identifiers: *East Arm Little Calumet River(IN), Porter County(IN), Intermediate Regional Flood, Standard Project Flood, Flood Plain Management Program, Salt Creek(IN), Coffee Creek(IN).

The portion of Porter County covered by this report is subject to flooding from the East Arm Little Calumet River and its tributaries, Salt and Coffee Creeks. The flood plains are primarily residential and agricultural with extensive open spaces currently under pressure for development. Coffee Creek, flowing in a northwesterly direction for 8 miles to its confluence with the river, slopes about 13 feet per mile with a 4 to 5 foot wide channel. Salt Creek, flowing northerly, slopes at an average of 5.2 ft/mi. Total drainage area is 150.1 square miles. The river, with a 3.3 ft/mi gradient, has 10 to 15 foot wide channels. March and April are months of heaviest runoff, but floods occur in all seasons due to excessive rainfall. Floods can rise to peak in a relatively short period of time. Thirty-four bridges and culverts obstruct large flood flows. State and county regulations require prior approval of construction in floodways. The county is expected to adopt flood zoning ordinances in the near future. The most damaging floods, in 1923 and 1954, caused inundation of bridges and several deaths. In 1954 the East Arm Little Calumet River had a peak discharge of 3,110 cubic feet per second. An Intermediate Regional Flood and Standard Project Flood would have peak discharges of 4,240 cfs and 15,000 cfs, respectively, at the existing streamgage. Flood flows from these streams would cover large areas in Chesterton and Porter, damaging residential and commercial properties and private and public utilities. (Salzman - North Carolina)
W76-10152

FLOOD PLAIN INFORMATION: LITTLE EAGLE CREEK AND TRIBUTARIES, MARION COUNTY, INDIANA.
Army Engineer District, Louisville, Ky.
Prepared for Marion County Metropolitan Planning Department and Indianapolis Flood Control District, June 1971. 46 p, 18 fig, 8 plates, 13 tab.

Descriptors: *Floods, *Flooding, *Flood stages, Flow characteristics, *Flood plains, *Flood protection, *Non-structural alternatives, Control structures, Diversion structures, Historic floods, Flood data, Peak discharge, Flood damage, Planning, Flood plain zoning, Obstructions to flow, Streamflow forecasting, *Indiana.
Identifiers: Little Eagle Creek(IN), Marion County(IN), Falcon Creek(IN), Dry Run(IN), Dry Run Diversion(IN), Intermediate Regional Flood, Standard Project Flood.

This report covers a study reach of 11.21 miles of the Little Eagle Creek and 9.58 miles of Falcon and Guion Creeks, Dry Run and Dry Run Diversion which flow through urban and suburban areas of Speedway and Indianapolis, IN. Having a total drainage area of 26.9 square miles, the streams contain all forms of development in their flood plains which vary in width from 200 feet to 1000 feet, with those of the tributaries being narrower. Flooding occurs during all seasons resulting from heavy rains in winter and early spring and severe thunderstorms in summer and fall. Floods are relatively short with generally high rates of rise. Many bridges and 3 dams obstruct flood flows which can reach 10 ft/sec in the channels. Flood control structures include a diversion channel from Dry Run to Little Eagle Creek and proposed channels, storm sewers, diversion channels and structures for all streams. State and local regulations prohibit construction in the floodways without prior approval. Since the establishment of a stream gage in 1959 the greatest flood occurred in April 25, 1961 cresting at 718.3 feet msld with a peak discharge of 1940 cubic feet per second on Little Eagle Creek. An Intermediate Regional Flood and Standard Project Flood on Little Eagle Creek are estimated to crest at 727.6 ft and 730.7 ft respectively, and have peak discharges of 9,000 cfs and 14,500 cfs. An IRF would rise to peak in 13 hours and remain 7 hours above bankfull, and the SPF would rise in 65 hours and last 20 hrs. (Salzman - North Carolina)
W76-10153

FLOOD PLAIN INFORMATION: CROOKED CREEK AND WILLIAMS CREEK, MARION COUNTY, INDIANA.
Army Engineer District, Louisville, Ky.
Prepared for Marion County Metropolitan Planning Department and Indianapolis Flood Control District, June 1970. 39 p, 18 fig, 7 plates, 7 tab.

Descriptors: Floods, Flooding, *Flash floods, *Flood flow, *Historic floods, *Flood stages, Flow characteristics, *Flood plains, Flood protection, *Non-structural alternatives, Planning, *Indiana, Flood data, Peak discharge, Flow duration, Building codes, Flood plain zoning, Obstructions to flow, Streamflow forecasting.
Identifiers: Indiana Flood Control Act, Crooked Creek(IN), Williams Creek(IN), Marion County(IN), Intermediate Regional Flood, Standard Project Flood.

Covering a distance of 14.6 miles, the Crooked and Williams Creeks drain 42.3 sq mi on the west side of the West Fork White River. The creeks flow in a southerly direction with slopes of 14.2 ft/mi on Crooked Creek and 16.8 ft/mi on Williams Creek. Residential and undeveloped areas are in the flood plains which range from 400 ft to 1500 ft wide. Most floods occur between January to April resulting from general heavy rains; however, intense local thunderstorms can cause flash flooding. With velocities ranging up to 13 ft/sec in the channel, floods last for a short time in upper reaches, while longer periods of flooding occur in the lower reaches due to backwater effects of the river. Flood damage prevention measures include county and state regulations which require approval of any construction in the floodways. Obstructions to flood flow include 36 bridges as well as heavy vegetation. The greatest flood occurred in 1957 with peak discharges of 4,000 cubic feet per second and 1500 cfs on Crooked and Williams Creeks, respectively. An International Regional Flood and Standard Project Flood would have peak discharges of 8,050 cfs and 15,500 cfs on Crooked Creek and 8,200 cfs and 17,000 cfs on Williams Creek. Velocities typical of both creeks are 13 ft/sec in the channel with 5 ft/sec in the overbank during an IRF; for the SPF, 18 ft/sec in the channel with 7 ft/sec overbank. (Salzman - North Carolina)
W76-10154

FLOOD PLAIN INFORMATION: TURKEY AND JOPLIN CREEKS, JOPLIN, MISSOURI.
Army Engineer District, Tulsa, Okla.
Prepared for the City of Joplin, September 1973. 41 p, 9 fig, 18 plates, 5 tab.

Descriptors: *Floods, *Flood profiles, *Flow characteristics, *Flood plains, Flooding, Streamflow forecasting, Historic floods, Peak discharge, Flow duration, Flashfloods, Obstructions to flow, Dikes, Channel improvement, *Missouri.
Identifiers: Turkey Creek(MO), Joplin Creek(MO), Joplin(MO), Standard Project Flood, Intermediate Regional Flood.

The flood plains of the two creeks of this study area are partially covered with residential, commercial and industrial development. Of particular importance are the Turkey Creek Sewage Treatment Plant, Ozark Bible College and part of a shopping center along Turkey Creek. Joplin Creek, with a drainage area of 6.4 square miles, is a tributary of Turkey Creek which drains 49 sq mi. Continued growth of the watershed will probably intensify land use in the flood plains. The majority of flood producing storms over these watersheds occur during the spring and early summer months. Flooding generally results from intense storms of short duration. Stream gage records are available continuously since 1963. Large floods have occurred 5 times since 1943 and caused rather extensive damages due to the conditions in the flood plain. In the event of an Intermediate Regional Flood peak discharges of 7770 cubic feet per second and 11,800 cfs are expected on Joplin and Turkey Creeks, respectively, along with channel velocities up to 7 ft/sec in Joplin Creek and 9 ft/sec in Turkey Creek. Overbank velocities will average 1 to 3 ft/sec. During a Standard Project Flood peak discharges of 13,400 and 21,500 cfs are expected on Joplin and Turkey Creeks, respectively. Channel velocities could average up to 8 ft/sec in Joplin Creek and 10 ft/sec in Turkey Creek. Maximum velocities, occurring near bridges, could be up to 16 ft/sec. Floods on Joplin Creek would last 4 hours and on Turkey Creek up to 30 hours. Many of the bridges and culverts in the area are obstructive to flow. Flood protection measures include some channel improvement, protective dikes around sewage treatment plant, and park land in the flood plain. (Smith-North Carolina)
W76-10155

FLOOD PLAIN INFORMATION: PORTAGE OPEN BAY AND MAIN DITCH, VICINITY OF PORTAGEVILLE, MISSOURI.
Army Engineer District, Memphis, Tenn.
Prepared for the City of Portageville, September 1972. 23 p, 5 fig, 10 plates, 5 tab.

Descriptors: *Floods, *Flood profiles, *Channels, Flooding, Streamflow forecasting, Historic floods, Peak discharge, Flood peak, Flow duration, Channel improvement, *Missouri.
Identifiers: Portageville(MO), *Portage Open Bay(MO), Main Ditch(MO), Standard Project Flood, Intermediate Regional Flood.

Portage Open Bay, with a drainage area of approximately 50 square miles above the lower limits of this study, is part of the Little River drainage system. Main Ditch drains 18 sq mi and is a tributary of Portage Open Bay. The topography of this area is extremely flat and the average slope of Portage Open Bay is less than 1.5 feet per mile. The flood plain of Portage Open Bay is narrow and practically undeveloped below the mouth of Main Ditch, which has some development in its flood plain. It is likely that future extension of Portageville would be into the flood plain of Main Ditch. Major floods can occur in all seasons of the year and can rise from normal flow to peak in a relatively short period of time. There are no stream gages in the immediate study area, but the largest recent flood occurred in 1966 when some damage was caused in Portageville to buildings and roads. Other floods occurred in 1945 and 1957. In the event of an Intermediate Regional Flood peak discharges of 1310 cubic feet per second and 3060 cfs are expected in Main Ditch and Portage Open Bay respectively, along with water velocities up to 3 feet per second in the main channel and 1.6 ft/sec in the overbank area. This flood would rise to peak in 5.8 hours and last 92 hours above critical stage. Four of 7 bridges would be obstructive to flow. In a Standard Project Flood peak discharges of 2810 cfs and 6550 cfs are predicted for Main Ditch and Portage Open Bay respectively. Water velocities would be slightly higher than during the IRF. This flood would rise to peak in 36 hours and last 120 hours. All bridges would be obstructive to flow. (Smith-North Carolina)
W76-10156

FLOOD PLAIN INFORMATION: SOQUEL CREEK, SANTA CRUZ COUNTY, CALIFORNIA.
Army Engineer District, San Francisco, Calif.
Prepared for Santa Cruz County, July 1973. 20 p, 8 fig, 10 plates, 7 tab.

Descriptors: *Flood flow, *Flood profiles, *Flood data, *Flood stages, *Flood peak, *California, Runoff, Streamflow forecasting, Storms, Winds, Tides, Flood frequency, Peak discharge, Flow duration, Flow characteristics, Flood damage, Flood plains, Channels, Warning systems, Reservoirs, Obstructions to flow, Channel improvement.
Identifiers: Santa Cruz County(CA), Soquel Creek(CA), Soquel(CA), Capitola(CA), West Branch Soquel Creek(CA), Hester Creek(CA), Hinckley Creek(CA), Coast Range Mountains(CA), Intermediate Regional Flood, Standard Project Flood.

Soquel Creek originates in the Coast Range Mountains about 13 miles northeast of the City of Santa Cruz. West Branch Soquel, Hester Creek, and Hinckley Creek are major tributaries. The creek drains an area of 42 square miles, and flows through the towns of Soquel (population 5,795) and Capitola (population 5,080). Soquel Creek has a slope in its lower reaches of 20 ft/mi. There is commercial, agricultural, and residential development in the flood plain. Eleven floods have occurred since 1899, generally in the months of October to May. The bulk of flooding can be expected from December to March as the result of general winter storms. Obstructions to flood flows include vegetation and 5 bridges and culverts. The majority of the inundation along the lower reaches of Soquel Creek has been due to constrictive encroachment of buildings along the creek and the additional backwater effects caused by tides and winds. Heavy flooding occurred in December 1955 when a peak discharge at the gage in Soquel reached 15,800 cubic feet per second. Damage to commercial and residential development in Soquel was heavy. The Intermediate Regional Flood and the Standard Project Flood would have peak discharges of 16,400 and 19,800 cfs respectively. Channel velocities would range from 7-15 ft/sec and overbank velocities from 1-3 ft/sec during IRF. Soquel Creek would rise 13.7 feet in 6 hours and with flood stage lasting 22 hours. No flood control projects are authorized in this basin, but in 1955 channel clearing was carried out. (Henley-North Carolina)
W76-10157

FLOOD PLAIN INFORMATION: SOUTH FORK SALT RIVER AND DAVIS CREEK, MEXICO, MISSOURI.
Army Engineer District, St. Louis, Mo.
Prepared for the City of Mexico, Missouri, November 1971. 44 p, 11 fig, 15 plates, 13 tab.

Descriptors: Floods, Flooding, *Flood profiles, *Peak discharge, *Flood peak, *Flow duration, *Flood plains, Floodwater, Regional flood, Streamflow forecasting, River forecasting, Historic floods, Hydrographs, *Missouri.

Identifiers: *Salt River-South Fork(MO), Davis Creek(MO), Mexico(MO), Standard project Flood, Intermediate Regional Flood.

Much of the land of Mexico, MO, a town of 11,800 people, is located on high ground, yet there are substantial numbers of residences and commercial buildings in the flood plain. Davis Creek, with a drainage area of 53 square miles is a tributary of the South Fork Salt River which drains about 92 sq mi above the lower limit of the study area. No gages are maintained on either stream near Mexico. A gage near Santa Fe (MO) on the South Fork Salt River was used for this study. Most floods occur during the spring. The largest known flood occurred in 1969 with a peak discharge of 28,800 cubic feet per second recorded in Santa Fe. Damages and losses have been estimated in the thousands of dollars in past innundations. Damage from large future floods would range from substantial to disastrous proportions in areas where development is encroaching on the flood plain. In an Intermediate Regional Flood (IRF) a peak discharge of 20,000 cfs is predicted on Salt River and 12,580 cfs on Davis Creek. Water velocities of up to 5.2 ft/sec in the channel and 2.4 ft/sec in overbank areas are expected on Davis Creek; 4.3 ft/sec in the channel and 1.5 ft/sec overbank for South Fork Salt River. In a Standard Project Flood (SPF) peak discharges of 45,300 cfs and 28,000 cfs are anticipated on the Salt River and Davis Creek respectively. Velocities would be slightly higher than in the IRF which would rise to peak in 14 hours and last a maximum of 23 hours while the SPF would peak in 34 hours and last a maximum of 40 hours. Flash flood conditions could cause substantially higher rates of rise. Most bridges in the study area are somewhat obstructive to flood flow. There are no major flood control measures upstream or in the study area. (Smith-North Carolina)
W76-10158

FLOOD PLAIN INFORMATION: BIG SANDY RIVER, LAWRENCE COUNTY, KENTUCKY.
Army Engineer District, Huntington, W. Va.
Prepared for the State of Kentucky, Department of Natural Resources and Environmental Protection, October 1973. 30 p, 3 fig, 12 plates, 4 tab.

Descriptors: *Floods, *Flooding, *River flow, *Flood forecasting, *Flood profiles, *Flood plains, *Kentucky, Floodwater, Streamflow forecasting, Historic floods, Flow duration, Rivers, Reservoirs.
Identifiers: *Big Sandy River(KY), Tug Fork(KY), Levisa Fork(KY), Louisa(KY), Standard Project Flood, Intermediate Regional Flood.

Big Sandy River is formed by the confluence of Tug and Levisa Forks, and flows northward into the Ohio River. Big Sandy flows on an alluvial fill which contains few bottomlands above the flood of record. The Big Sandy drains 4,290 square miles. There is little development in the flood plains although there is some farming, a highway and a railroad. Louisa, the largest town, occupies high ground near the river. Eight of 10 major floods occurred in months January through April, though the largest flood, in 1875, occurred in July. Never have any floods damaged Louisa directly, yet during periods of high flow, roads, telephones, and water and sewerage systems are generally unusable. It is anticipated that as the area grows there will be pressure to develop bottom land causing heavy future damages. In the Levisa Fork basin 4 flood control reservoirs have been constructed which reduce flood crests by sizeable amounts. In an Intermediate Regional Flood floodwaters would be considerably higher than the largest flood of record, and about 10.7 feet higher than the major 1955 flood, with water velocities up to 8 feet per second. The IRF would rise to peak in about 42 hours and last 4 days. The Standard Project Flood, about 16.5 feet higher than the 1955 flood, would rise to peak in 47 hours and last 4.5 days. There are few obstructions to flow in these streams, though a recently constructed power plant could restrict flow of very large floods. There are no flood regulations in effect. However, Kentucky statutes require review of projects in floodways and the issuance of permits so that development can be controlled. (Smith-North Carolina)
W76-10159

SPECIAL FLOOD HAZARD INFORMATION: ARKANSAS RIVER, ARKANSAS CITY, KANSAS.
Army Engineer District, Tulsa, Okla.
Prepared for the City of Arkansas City, Kansas, January 1971. 6 p, 7 plates.

Descriptors: Floods, *Floodwater, Flooding, *Streamflow forecasting, *Flood profiles, *Flood plains, *Non-structural alternatives, Flood forecasting, Peak discharge, Stream erosion, Deposition(Sediments), Levee, *Kansas.
Identifiers: *Arkansas River(KS), Arkansas City(KS), Flood proofing.

Developments in this study area include considerable urban land in Arkansas City. In areas previously flooded are now built an oil refinery, a sewage disposal plant and many other structures. The Arkansas River is a tributary of the Mississippi River, and has a total length of about 1,460 miles and a drainage area of 160,600 square miles, 36,100 sq mi of which is above Arkansas City. 'The channel is generally wide and meandering, with low banks.' Though stream flow records are available from 1902 to 1906 and 1921 to the present, this data indicates that a stage-discharge relationship for the study reach would not be reliable because of the erosion and disposition of silt in the sandy channel of the river. The highest peak discharge, 103,000 cubic feet per second, occurred in 1923. Numerous times during the period 1902 to present the Arkansas River has exceeded its bank near Arkansas City. Flooding is most likely to occur from April to October. In an Intermediate Regional Flood a peak discharge of 120,000 cfs is estimated. Waters would reach a stage about 1.8 feet above the 1923 flood, and would overtop an existing levee and cause flooding within the levee. This report gives little information on existing protection measures, if any, but does give guidelines on possible solutions, including flood proofing, urban renewal, flood plain regulations, development policies, open space, tax adjustments and warning signs. (Smith-North Carolina)
W76-10160

SPECIAL FLOOD HAZARD INFORMATION: LABETTE AND LITTLE LABETTE CREEKS, PARSONS, KANSAS.
Army Engineer District, Tulsa, Okla.
Prepared for Labette County Planning Commission, Kansas, February 1973. 7 p, 1 fig, 13 plates, 1 tab.

Descriptors: *Floods, *Flood profiles, *Non-structural alternatives, *Flood plains, Flooding, Streamflow forecasting, Peak discharge, Flood plain zoning, Flood plain insurance, Warning systems, Building codes, Land use, *Kansas.
Identifiers: Labette Creek(KS), Little Labette Creek(KS), Parsons(KS), *Flood plain management, Intermediate Regional Flood.

The study area terrain consists of sparsely wooded, low rolling hills, and is used predominately for seasonal crops and pasture. Labette Creek, with a total drainage area of 397 square miles, is a tributary of the Neosho River. The drainage area above the lower limits of the study area is 88 sq mi. The flood plains of Labette Creek and Little Labette Creek are 1 mile and .5 mile wide respectively. 'The channel through the City of Parsons is well defined with fairly stable banks.' Though historical data indicates that Labette Creek has been subject to frequent flooding, this record is so sparse that it is not presented. In an Intermediate Regional Flood a peak discharge of 33,000 cubic feet per second on Labette Creek below Little Labette Creek is predicted. Above this confluence a peak discharge of 20,500 is expected. A peak discharge of 14,140 cfs is expected on Little Labette Creek. Several bridges in the study area would be overtopped by this flood. No flood plain management has been undertaken in this area, but this report gives guidelines, including a discussion of zoning, subdivision regulations, building codes, health regulations, development policies, and flood insurance. (Smith - North Carolina)
W76-10161

SPECIAL FLOOD HAZARD INFORMATION: WHISKEY AND ROCK CREEKS, INDEPENDENCE, KANSAS.
Army Engineer District, Tulsa, Okla.
Prepared for the City of Independence, Kansas, October.1974. 10 p, 5 plates, 1 tab.

Descriptors: *Floods, *Flood profiles, *Flood plains, *Flood protection, *Kansas, Flooding, Flood flow, Streamflow forecasting, Maximum probable flood, Peak discharge, Obstructions to flow, Non-structural alternatives, Flood plain zoning, Flood plain insurance, Building codes, Reservoirs.
Identifiers: Whiskey Creek(KS), Rock Creek(KS), Independence(KS), Standard Project Flood, Intermediate Regional Flood, Verdigris River(KS), Flood plain management.

Developments in the flood plains of this study area are mainly agricultural, residential and commercial. Whiskey Creek, with a watershed of 3.5 square miles, is a tributary of Rock Creek which in turn is a tributary of the Verdigris River near Independence. Rock Creek has a watershed of 24.8 sq mi including that of Whiskey Creek. No streamgage information is available for these creeks. For Rock Creek the maximum flood occurred in 1945, but caused little damage. In 1967 6.83 inches of rain in 20 hours caused the largest flood to date on Whiskey Creek. It was estimated to have a frequency of 50 years and had a peak discharge of 4,400 cubic feet per second. In an Intermediate Regional Flood (IRF) peak discharges of 5,000 cfs on Whiskey Creek at its confluence with Rock Creek, and 10,000 cfs on Rock Creek are expected. In a Standard Project Flood (SPF) discharges of 7,600 cfs and 19,400 cfs on Whiskey and Rock Creeks, respectively, are anticipated. In an IRF 2 of 8 bridges across Rock Creek would be obstructive to flood flow and in a SPF 5 bridges would cause some obstruction to flow. On Whiskey Creek all 17 bridges would obstruct flow in either major flood. Little has been done in this area to reduce flood damages, though 3 reservoir which have been built on the Verdigris River and its tributaries would reduce the backwater effects of that river. The report gives common methods for dealing with potential floods, including zoning, subdivision regulations, building codes, health regulations, development policies and flood insurance. (Smith - North Carolina)
W76-10162

FLOOD PLAIN INFORMATION: LYNN CAMP AND EAST FORK LYNN CAMP CREEKS, CORBIN, KENTUCKY.
Army Engineer District, Nashville, Tenn.
Prepared for the City of Corbin, Kentucky, May 1974. 42 p, 14 fig, 15 plates, 5 tab.

Descriptors: *Floods, Flooding, *Flood flow, *Flood profiles, *Historic floods, *Flood stages, Channel improvements, *Kentucky, Floodwater, Flash flood, Flood forecasting, Flood peak, Flow duration.
Identifiers: Corbin(KY), Lynn Camp Creek(KY), Standard Project Flood, Intermediate Regional Flood.

Most of the flood plain of Lynn Camp Creek in the only town in this study area, Corbin, is devoted to

esidential, commercial and industrial uses. Lands n the upper ends of the study reach are largely un-eveloped. On the East Fork Lynn Camp Creek here is only light residential build-up. The East ork with a drainage area of 27.8 square miles ows into Lynn Camp Creek which has a drainage rea of 61.2 sq mi. Major floods in this basin sually occur in late winter and early spring and re the result of prolonged heavy rain. Floods at orbin can be of flash type, rising to crest very uickly. Stream gage data has been available in is area since 1957, shortly after the record flood that year when peak discharge was about 9,000 ubic feet per second. Damage in Corbin was ex-ensive and was estimated to be $2 million. In esponse to this flood the Corps of Engineers un-ertook a protection project which includes en-rgement of about 2 miles of the natural channel, cutoff channel about 475 feet long across an rupt bend in the stream, and related bridge and ainage work. The project, completed in 1964, is apable of passing a flood 3 times the capacity of e original channel which will prevent most sses. It is estimated that because of this protec-on an Intermediate Regional Flood (IRF) would e 1.6 feet below the 1957 flood, though a Stan-ard Project Flood (SPF) would be little curtailed the project and would be 9.3 feet above the RF. The IRF would be expected to rise to peak in hours and last only 12 hours, while the SPF ould rise in 7.5 hours and last 21 hours. (Smith - orth Carolina)
76-10163

LOOD PLAIN INFORMATION: CLEAR REEK-MULBERRY CREEK, VICINITY OF HELBYVILLE, KENTUCKY.
rmy Engineer District, Louisville, Ky.
repared for the City of Shelbyville and the Ken-cky Department of Natural Resources, March 73. 26 p, 17 fig, 8 plates, 6 tab.

escriptors: Floods, *Flood flow, *Flood profiles, Flood peak, *Flow duration, *Flood plains, Ob-ructions to flow, *Kentucky, Runoff, Flood-ater, Flooding, Streamflow forecasting, Flood ta.
entifiers: Shelbyville(KY), Clear Creek(KY), ulberry Creek(KY), Standard Project Flood, In-rmediate Regional Flood.

operties along Clear Creek are primarily rural in ture, though there are residential and commer-al developments in Shelbyville, a town of 19,000 ople, which includes many small industries, mmerce, a fire department, a sewage treatment ant, sanitary land fill, and a lake park which is ed for recreation. Mulberry Creek has little velopment along its banks. This creek, with a ainage of 8.4 square miles, flows into Clear eek which has a total drainage area of 61.9 sq . Floods on these creeks are in general caused runoff from intense rainfall in winter and spring nths, though floods have occurred in all asons. During the last 180 years Shelbyville and cinity have been flooded many times. The 1964 od was the largest when a peak discharge of ,000 cubic feet per second was recorded on ear Creek. Thirty people were forced to leave ir homes and $500,000 in damages was caused. an Intermediate Regional Flood (IRF) peak charges of 17,700 cfs and 6,320 cfs are expected Clear and Mulberry Creeks, respectively, along th water velocities up to 10 feet per second in main channel and 3 ft/sec in the overbank as. The IRF would reach peak elevation in out 12 hours after the beginning of rise and uld be 20 hours above bankfull elevation. Dur-a Standard Project Flood peak discharges of 400 cfs and 12,800 cfs are expected on Clear eek and Mulberry Creek, respectively. Water ocities would be slightly higher than during the F. This flood would rise in 36 hours to 48 hours d remain 27 hours above bankfull elevation. nith - North Carolina)
76-10164

FLOOD PLAIN INFORMATION: PIKE CREEK, NEW CASTLE COUNTY, DELAWARE.
Army Engineer District, Philadelphia, Pa.
Prepared for New Castle County (DE) Department of Planning, December 1975. 18 p, 3 fig, 9 plates, 7 tab.

Descriptors: *Floods, *Flooding, *Flood plains, *Peak discharge, *Non-structural alternatives, Flood stages, Flow characteristics, Flood protection, Flood plain zoning planning, *Delaware.
Identifiers: Pike Creek(DE), New Castle County(DE).

Pike Creek, a tributary to White Clay Creek, flows in a southeasterly direction for 6.4 miles through New Castle County covering a total drainage area of 6.3 square miles. Its flood plains consist of agricultural and rural areas with scattered residential and commercial properties which are coming under increasing pressure for development. Characterized by steep banks covered with brush and trees, the stream slopes at an average of 37 feet per mile in the southern reaches and 68 ft/mi in the northern portion. Floods generally occur in mid and late summer due to hurricane and thunderstorm activity reaching flood peaks in a relatively short period of time with high velocities. Although no flood control projects exist on Pike Creek, the county prohibits filling in or development of the flood plains. The greatest flood occurred in July 1969 having an estimated peak discharge of 2550 cubic feet per second and cresting at 40.1 feet. Estimated peak discharges and elevations for a 100-year and 500-year flood are 3,010 cfs and 5140 cfs cresting at 42.7 feet and 45.3 feet respectively. Projected velocities for 100-year flood range from 4.4 to 11.2 ft/sec in channel and from 2.8 to 4.0 ft/sec overbank; for a 500-year flood, 4.2 to 13.2 ft/sec in channel and 2.8 to 5.2 ft/sec overbank. A 100-year flood could have a critical stage for as long as 15 hours. This report furnishes a suitable basis for the adoption of land use controls to guide flood plain management. (Salzman - North Carolina)
W76-10165

FLOOD PLAIN INFORMATION: NORTH FORK KENTUCKY RIVER AND TRACE FORK, VICINITY OF HAZARD, KENTUCKY.
Army Engineer District, Louisville, Ky.
Prepared for the City of Hazard, Kentucky, March 1972. 44 p, 22 fig, 12 plates, 8 tab.

Descriptors: *Floods, *Flood forecasting, *Flood plains, Flooding, Flash flood, Overflow, Indirect flood measurement, Streamflow forecasting, Historic floods, Flood data, Peak discharge, Obstructions to flow, *Kentucky.
Identifiers: *Kentucky River(KY), Lotts Creek(KY), Trace Fork(KY), Hazard(KY), Intermediate Regional Flood, Standard Project Flood.

Development along the streams is principally located in Hazard though there are other communities and intermittent development elsewhere. A considerable number of structures are susceptible to flood damage. Trace Fork is a tributary of Lotts Creek which has a drainage area of 28 square miles and flows into the North Fork of the Kentucky River which drains 2,631 sq mi. In winter and spring floods are caused by widespread heavy rains, and in summer floods due to intense local thunderstorms occur. The largest flood was in 1957 when the peak discharge was 47,800 cubic feet per second, and the business district of Hazard was completely destroyed. Damages were estimated at $6.8 million. Water velocities reached 7 feet per second. In an Intermediate Regional Flood (IRF) a peak discharge of 52,300 cfs is predicted on the North Fork Kentucky River and 2,580 on Trace Fork. Water velocities may range up to 14 and 18 ft/sec in the main channel of North Fork Kentucky River and Trace Fork respectively. Overbank velocities would be 4.6 and 8.5 ft/sec respectively. In a Standard Project Flood (SPF) peak discharges of 140,000 and 5,340 cfs are anticipated on North Fork Kentucky River and Trace Fork respectively along with water velocities slightly higher than the IRF. Most of the many bridges over these streams would be at least somewhat obstructive to flows and some would be very obstructive. Now under construction is a dam at Carr Fork Lake which will have some impact on floods in this study area. Peak discharges would be reduced to 50,300 cfs in an IRF and 135,000 cfs in a SPF. (Smith-North Carolina)
W76-10166

FLOOD PLAIN INFORMATION: DRY TURKEY AND BULL CREEKS, MCPHERSON, KANSAS.
Army Engineer District, Tulsa, Okla.
Prepared for the City of McPherson, Kansas, August, 1972. 31 p, 8 fig, 17 plates, 5 tab.

Descriptors: Floods, *Flood flow, *Flood profiles, *Flow duration, *Flood plains, *Non-structural alternatives, Floodwater, Streamflow forecasting, Historic floods, Peak discharge, Obstructions to flow, Flood plain zoning, *Kansas.
Identifiers: Dry Turkey Creek(KS), Bull Creek(KS), McPherson(KS), Subdivision regulations, Standard Project Flood, Intermediate Regional Flood.

Much of the land in the flood plains along these streams is agricultural, except in McPherson, (population 11,000) an important oil producing area, which is expected to grow in the future. Bull Creek, with a drainage area of 19.6 square miles, is a tributary of Dry Turkey Creek which drains 55.5 sq mi and flows into Turkey Creek. Flooding results generally from intense storms of short duration, occuring usually in spring and fall. Due to mild stream slopes and relatively flat overbank areas, flood waters rise slowly, cover considerable land, and last for extended periods. There are no stream-gages in the area, but six major floods have occurred since 1902. In an Intermediate Regional Flood peak discharges of 5,400 cubic feet per second and 13,900 cfs can be expected on Bull and Dry Turkey Creeks, respectively, along with water velocities of about 2 ft/sec in the main channel and overbank areas. In a Standard Project Flood peak discharges of up to 10,800 cfs on Bull Creek and 27,000 cfs on Dry Turkey Creek are predicted. Water surface elevations for the SPF are estimated to reach as much as 5 feet in some sections of McPherson. Major floods last approximately 30 hours. Most bridges on Dry Turkey Creek and all bridges on Bull Creek would be topped by either flood. There are no existing or proposed Federal flood control measures on these Creeks, though some channel improvements have been constructed by local interests. Subdivision regulations restrain building on lands subject to periodic flooding, yet with proper improvements and adequate drainage such construction can be undertaken. (Smith-North Carolina)

ARIZONA'S WATER SUPPLY-SOME REFLECTIONS,
Arizona Bureau of Mines, Tucson.
H. W. Peirce.
Field Notes, Vol. 6, No. 2, p 1-4, 16, June 1976. 2 fig, 2 ref.

Descriptors: *Arizona, *Water resources development, *Water supply, *Water utilization, *Basins, Water management(Applied), Arid lands, Range management, Human population, Natural resources, Withdrawal, Long-term planning, Agriculture, Groundwater, Geologic formations.

Arizona's water supply and use characteristics are analyzed, and an approach to effective management of this limited resource is outlined. At present, substantially more water is being used than is replenished by natural sources, especially in the areas of rapid population growth (Phoenix and Tucson). This Basin and Range region of southwestern Arizona has more natural resources such as water, minerals and better climate and soil conditions for attracting new residents. The Plateau region in northern Arizona is superior only in its quantity of fossil energy sources. Currently, surface waters account for 40% and pumped underground water for 60% of the withdrawals; 89% of the water is used for agriculture. Over 2 million acre-feet more water is used annually than is replenished. Depletion rates are nearly 100 times the magnitude of dependable (renewable) supply in some of the smaller hydrologic basins. Other statistics relating to water use are provided along with a description of the Basin and Range Province development. (Jahns-Arizona)

Descriptors: *Networks, *Water distribution(Applied), *Mathematical models, *Simulation analysis, Research, Digital computers, History, Pipes, Water demand, Hazen-Williams equation, Systems analysis, Wisconsin.
Identifiers: Impact, Menomonie(Wis).

With increased emphasis on digital computer modeling of the hydraulic performance of water distribution networks for design and automatic operational control, there has been a recent upsurge of interest in the impact of expedients commonly employed in network simulation, i.e., skeletonization, load consolidation, C value allocation, and assumed pipe resistance factors). This article presents an historical explanation of the recent upsurge of interest and presents an approach to studying the impact of simulation expedients; it is an approach to fulfilling the research need, consisting of building detailed models of actual but representative grid systems, verifying the performance of the models, and using them as research tools to investigate the impact of various simplifying assumptions often made in network modeling. The value of the approach is demonstrated with a case study made in Menomonie, Wisconsin, and its merits are discussed in terms of ultimately being able to generalize about the degree of input data refinement necessary to model grid systems adequately. TERNATIONAL SURVEY ON EXISTING ATER RECHARGE FACILITIES.
ernational Association of Scientific Hydrology, ntbrugge (Belgium).
blication No. 87, 1970. 761 p, 32 fig. $10.00.

scriptors: *Artificial recharge, *Water manage-nt(Applied), *Groundwater recharge, Natural harge, Water wells, Recharge wells, Aquifers, erdraft, Well yield, Safe yield, Flooding, Water el fluctuations, Watersheds(Basins), Ground-ter barriers, Geologic control, Geohydrologic ts.
ntifiers: *International artificial recharge in-llation survey.

The International Association of Scientific Hydrology with the assistance of the Burgeap Company (France) established an international inventory of installations for the artificial recharge of underground water-levels. The aims pursued are solutions to the problems of: (1) Dry season pumping at higher rates than natural aquifer recharge capacities; (2) Water storage allowing pumping rates greatly superior to natural groundwater resources; (3) Recharge of overpumped ground-water reservoirs', (4) Improvement of water quality by natural filtration, (5) Fresh water barriers against saline intrusion or infiltrations from polluted rivers; and (6) Flood control. The economics of artificial recharge as well as the reasons for choosing it over alternative measures. Each country included in the recharge installation inventory conducts the process in various geologic lithologies ranging from Diluvium gravels to basalts. This wide variety of lithologies effectively represents worldwide geohydrologic conditions. The origin of injected water, techniques of recharge, structures used for artificial recharge and pumping systems are outlined for each particular installation listed. The inventoried countries include: Germany (western), Australia, England, France, Hungary, Iran, Israel, Jamaica, Japan, Morracco, Mexico, Holland, South Africa, Switzerland, Czechoslovakia and the United States of America. CHANGE IN DRAWDOWN CAUSED BY ENLARGING A WELL IN A DOLOMITE AQUIFER,
Geological Survey, Columbus, Ohio. Water Resources Div.
S. E. Norris.
Ground Water, Vol. 14, No. 4, p 191-193, July-August, 1976. 1 fig, 2 tab, 5 ref.

Descriptors: *Water wells, *Drilling, *Drawdown, Aquifers, Permeability, Turbulent flow, Groundwater, Ohio.
Identifiers: *Well modification, *Well enlargement, Well-loss constant, Pumping rates, Power cost reduction.

Step-drawdown tests were conducted on a well, in a dolomite aquifer in north-central Ohio, before and after it was enlarged from 10 inches to 12 inches (250 to 300 millimeters) in diameter. Changes were noted in the well-loss constant, the exponent for turbulent flow and the formation loss factor. The calculated difference in drawdown resulting from enlargement is of little importance at rates of 300 to 500 gallons per minute (19 to 31 liters per second), the range of which the well is expected to be pumped, but for higher rates the decrease in drawdown and consequent reduction in power costs could be significant. For a pumping rate of 1500 gallons per minute (95 liters per second), the decrease in drawdown would be 20.4 (6.2 meters). (Heiss-NWWA)
W76-10088

TACOMA'S NORTH FORK WELLS.
Ground Water Age, Vol. 10, No. 10, p 26-28, 43, June, 1976.

Descriptors: *Water wells, *Groundwater, *Surface-ground water relationships, Unconfined aquifers, Sands, Gravels, Pumps, Rotary drilling, Well screens, Water requirements, Water resources development, Water supply, Washington.
Identifiers: *High volume water wells, *High volume submersible pumps, *Green River(Wash), *North Fork(Wash), Tacoma(Wash).

Seven of the most productive water wells in the world are currently being constructed on the North Fork of Washington's Green River. These wells are a part of a 55-million dollar project intended ultimately to double the City of Tacoma's water supply. Each well will yield an estimated twelve-million gallons of water per day. The preliminary ground-water feasibility study performed by Tacoma ground-water geologists showed that a sand and gravel body which underlies, and is fed directly by the North Fork of the Green River near the confluence of the two streams. The study indicated that the aquifer's specific yield was in excess of 72-million gallons per day. The wells were designed for thirty-two inch casings containing twenty-eight inch inner diameter stainless steel screens. Submersible pumps equipped with 380 horsepower, 2300 volt meters, eleven feet long and seventeen inches in diameter were used in the wells, each capable of producing an average of 8,333 gallons per minute. These wells will fulfill Tacoma's water need well into the 21st century. (Heiss-NWWA)
W76-10089

ELECTRICAL WATER PROSPECTING.
Ground water Age, Vol. 10, No. 9, p 27, 30, May, 1976. 1 fig.

Descriptors: *Subsurface investigations, *Electrical resistivity, *Logging(Recording), *Subsurface mapping, *Water wells, Physical properties, Geologic formations, Arid lands, Foreign countries, Africa.
Identifiers: *Geo-electric soundings, Apparent resistivity, Electrode fields, Electrical potential variations, *Geo-electric models, Bore siting, South West Africa.

Geo-electrical soundings have been used for the past two years to find water in the arid northern region of South West Africa. The work is directed at improving the siting of useful boreholes, which previously has had a success rate of only approximately 30 percent in this area. To date, one well has been sunk using geo-electrical soundings, and water was found at an encouragingly shallow depth. The geo-electrical technique is based on the different electrical resistivities of geologic formations. The apparent resistivity of the area is found by passing a current through the ground between electrodes and measuring the resulting potential difference between the furthest pair. Expansion and rearrangement of the electrode field about a chosen point registers the variation of apparent resistivity. This variation of the apparent resistivity with electrode separation can be depicted as a sounding curve. Interpretation of this curve makes it possible to construct a geo-electrical model of the geological structure of the subsurface. The position of the water table profoundly affects the readings. If this application can be verified most of the guess work can be taken out of borehole siting in the area. (Heiss-NWWA)

FRESH WATER CAN BE STORED IN SALINE AQUIFERS,
Louisiana State Univ., Baton Rouge.
O. K. Kimble, R. G. Kazmann, and W. R. Whitehead.
The Johnson Drillers Journal, Vol. 48, No. 2, p 1-4, 17-18, March-April, 1976. 3 fig.

Descriptors: *Aquifers, *Underground storage, *Reservoirs, *Saline water, Freshwater, *Saline water-fresh water interfaces, Injection wells, Water wells, *Storage capacity, Withdrawal, Pumped storage, Reservoir silting, Saline water intrusion, *Water storage.
Identifiers: *Saline aquifers, Injection-withdrawal cycles, Recovery efficiency, Emergency reservoirs, Surface reservoir disadvantages.

Due to the growing need for emergency fresh water reservoirs, the concept of storing fresh water in saline aquifers is being considered. Traditionally the dammed surface reservoir has served the purpose; but now because of land costs and realization of the silt problems, surface reservoirs have become much less advantageous. Deep saline aquifers underlay much of the country and offer potential storage space for fresh water in convenient locations. Essentially the process is achieved by creating a stagnant zone in the ground water flow of a selected aquifer and storing fresh water in that zone. Fresh water and salt water is segregated due to their density differences. The resultant body of fresh water will be shaped like an inverted, truncated cone whose outer volume is composed of a brackish water interface and whose inner volume is made up of fresh water. The injection field can be single or multi well systems. Recovery efficiency increases after the second injection/withdrawal cycle. The length of storage without appreciable harm to the recovery ratio cannot be predicted at this point. Further study is required in this area before projects of this nature can be implemented. DIGITAL MODEL FOR SIMULATED EFFECTS OF GROUND-WATER PUMPING IN THE HUECO BOLSON, EL PASO AREA, TEXAS, NEW MEXICO, AND MEXICO,
Geological Survey, Austin, Tex.
W. R. Meyer
Available from the National Technical Information Service, Springfield, Va 22161 as PB-253 015 as printed copy $5.50, microfiche $2.25. Water-Resources Investigations 58-75, April 1976. 31 p, 13 fig, 2 tab, 12 ref.

Descriptors: *Groundwater resources, *Model studies, *Water levels, *Projections, *Pumping, *Computer programs, Analytical techniques, Hydrogeology, Aquifer characteristics, Water table, Groundwater recharge, Water storage, *Texas.
Identifiers: *Hueco Bolson(Tex), *El Paso area(Tex).

The Hueco Bolson provides a substantial part of the municipal and industrial water supply of the El Paso area of Texas, New Mexico, and Mexico. Although the supply of fresh groundwater in the bolson is large, about 10.6 million acre-ft (13,070 cubic hectometres) in 1973 in the Texas part of the bolson alone, the supply is being depleted. A digital model study showed that a proposed plan of development for 1973-91, in which pumping would be increased by 29 percent in the Texas part of the bolson and by 34 percent in Ciudad Juarez, would cause additional water-level declines of as much as 45 feet (13.7 m) in the vicinity of El Paso and 70 feet (21.3 m) in Ciudad Juarez. The study also showed that nearly 60 percent of the water would come from storage in the water-table part of the bolson aquifer and 28 percent from leakage from the alluvium. By the end of the period, 9.84 million acre-ft (12,133 cubic hectometres) of fresh water would be in storage in the Texas part of the bolson, as compared to 10.6 million acre-ft (13,070 cubic hectometres) in storage in 1973. COST FUNCTIONS FOR ADDITIONAL GROUND WATER DEVELOPMENT,
Geological Survey, Reston, Va. Water Resources Div.
T. Maddock, III.
Water Resources Bulletin, Vol. 12, No. 3, p 539-545, June 1976. 2 tab, 9 equ, 6 ref.

Descriptors: *Groundwater, *Water resources development, *Water rights, Costs, Energy, Industries, Equations, Operating costs.
Identifiers: *Cost functions, *Coal gasification.

In many regions of the United States, the development of new water-intensive industries for production of energy may upset the existing water rights structure. Such an industry is coal gasification. This paper develops external cost functions for determining compensation to existing groundwater users when additional withdrawals are requested by new users. The functions reflect increased energy costs, and as presented, they are based on a linear relation between drawdown and pumping. It is assumed that the fixed cost of drilling and completing wells and the variable cost of operating wells overshadow the pipeline company's compensatory payments. It is also assumed that the energy costs represent the profit losses to the original users. In conclusion, it should be noted that compensation payment will result in costs to new users that are not trivial. (Bell-Cornell)

4C. Effects On Water Of Man's Non-Water Activities

HIGHWAY-WILDLIFE RELATIONSHIPS VOLUME I. A STATE-OF-THE-ART REPORT,
Urban Wildlife Research Center, Inc., Ellicott City, Md.
D. L. Leedy.
Report FHWA-RD-76-4, December 1975, 183 p. Final report to Department of Transportation, Washington, D.C., Federal Highway Administration. FCP 33F2-182 P. O. 5-30189.

Descriptors: *Highway effects, Highways, *Wildlife, Fish, *Reviews, Erosion, *Erosion control, *Bibliographies, Research priorities, *Environmental effects, Comprehensive planning, *Vegetation establishment, *Right-of-way, Wildlife habitats, Wildlife management, *Highway deicing, Parks, Waste disposal, Pollution abatement, Fish passages, *Road construction, Roads, Transportation.

This study assesses, primarily through an extensive literature review, what is known about highway-wildlife relationships and suggests research and management approaches to protect and enhance fish, wildlife, and environmental quality. A cooperative effort to this end among natural resource and highway agency personnel is needed on a continuing basis from the initial planning stages for new highway construction through operation and maintenance. The 20 million or more acres in highway rights-of-way have been largely neglected as wildlife habitat. Opportunities exist for creating valuable fish and wildlife impoundments during construction, yet the minimal effort needed to locate and design such impoundments has generally not been made. The Nation's four million miles of streets and highway often create 'edges' conducive to wildlife. Many millions of wild vertebrates are killed annually, but apparently most wildlife populations are not seriously affected by such losses. Highway construction through limited ranges of endangered species can be a serious problem, as can erosion, wetland drainage, stream alteration, structures which

block the passage of anadromous fish, and pollutants resulting from highway maintenance and use. Better measures for mitigating habitat losses, predicting effects of highways on fish and wildlife, reducing animal-vehicle accidents, and enhancing highway environment for fish, wildlife, and people are sorely needed. Identifiers: *Yampa River basin(Colo-Wyo).

Coal resources of the western United States are being developed at ever-increasing rates, causing concerns of the effects of mining and associated activities on the environment. The Yampa River basin in northwestern Colorado and south-central Wyoming is undergoing economic development of its coal, oil and gas, and uranium resources. The Yampa River basin assessment is a 2.5-year program of the U.S. Geological Survey. It is designed primarily to assess the availability and quality of the basin's water resources. The basin assessment also will evaluate potential environmental and selected socioeconomic impacts of energy-resource development plans proposed by mining and power companies. This report serves as a project work plan for the basin assessment's first-phase work activities. (Woodard-USGS)

COMPARISON OF SHEEP AND CATTLE GRAZING ON SEMIARID GRASSLAND,
Commonwealth Scientific and Industrial Research Organization, Deniliquin (Australia). Div. of Land Resources Management.
A. D. Wilson.
Australian Journal of Agricultural Research, Vol. 27, No. 1, p 155-162, January, 1976. 2 tab, 2 fig, 12 ref.

Descriptors: *Sheep, *Cattle, *Grazing, *Pasture management, *Grasslands, Arid lands, *Australia, Diets, Grasses, Seasonal, Legumes, Forage palatability.
Identifiers: *New South Wales.

A 2-year study in New South Wales compared Hereford steers and Border Leicester X Merino wethers as to their diet's botanical and chemical composition and changes in body weight while grazing a semiarid grassland in adjacent paddocks. The Danthonia caespitosa-Stipa variabilis type grassland contained 200-800 kg/ha of green pasture, primarily warm-season grasses with components of cool-season grasses, chenopod plants, medics and other forbs. Plots were permanently grazed by sheep at 1.03 and 1.45/ha or cattle at 0.13 and 0.18/ha; animals fitted with esophageal fistulas were introduced periodically to estimate diet composition. Cattle ate fewer short medics and cool-season grasses and more dry herbage than sheep, although in vitro digestibles of both diets were similar. Cattle diets were consistently lower in nitrogen and had a higher weight/ha at the greater stocking rate. Weight fluctuations at both stocking rates were greater for sheep, although the differences were slight. Similar weight changes did not support the notion that sheep are better suited to semiarid winter-rainfall areas. Economic differences will probably be more important than biological ones in determining the ratio of sheep to cattle on grazing properties. (Jahns-Arizona)

EFFECTS OF CLEAR-CUTTING ON NUTRIENT LOSSES IN ASPEN FORESTS ON THREE SOIL TYPES IN MICHIGAN,
Michigan Univ., Ann Arbor. School of Natural Resources.
C. J. Richardson, and J. A. Lund.
In: 'Mineral Cycling in Southeastern Ecosystems, 1975, (CONF-740513), p 673-686. 1 fig, 3 tab, 27 ref.

Descriptors: *Clear-cutting, *Nutrients, *Deciduous forests, *Soil types, *Leaching, Michigan, Nutrient cycling, Absorption, Nitrates, Ammonia, Phosphates, Potassium, Calcium, Sodium, Iron, Magnesium, Precipitation(Atmospheric), Groundwater, Hydrologic budget.
Identifiers: Aspen forests.

Clear-cutting of aspen may not significantly reduce nutrient uptake because of rapid revegetation by aspen root sprouts. Rapid shoot development would permit absorption and recycling of nutrients from soil and prevent nutrient loss. To evaluate first-year effects of clear-cutting on soil leaching in aspen forests on different soil types, nitrate, ammonium, phosphate, potassium, calcium, sodium, iron, and magnesium ion losses from 60-year-old aspen stands in Michigan were evaluated. Soil-nutrient leachate ion concentrations were not significantly higher on clear-cut plots during the first growing season. Nitrate-nitrogen and ammonium-nitrogen leachate values were less than the seasonal precipitation input. Leachate concentrations were highest following the spring thaw, then fluctuated through the growing season. Highest nutrient losses were generally from good soils. Groundwater accretion was about 12 cm/year higher on clear-cut plots. A preliminary nutrient budget was calculated from input and output determinations. During the first year in controlled clear-cuts, there was little evidence of increased nitrate-nitrogen, ammonium-nitrogen, phosphate, magnesium, potassium, sodium, and iron losses due to clear-cutting. Losses of leachate calcium and magnesium above control levels due to clear-cutting exceeded precipitation inputs only on good soil. Definite answers about nutrient losses cannot be determined until complete nutrient and hydrologic budgets are determined. (See also W76-10266) (Buchanan-Davidson--Wisconsin)

THE EFFECT OF NONREMOVAL CLEAR-CUTTING AND PINE REFORESTATION OF THE CATION COMPOSITION OF A HARDWOOD FOREST SOIL,
Environmental Protection Agency, Washington, D.C. Office of Environmental Sciences.
J. D. Yount.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 744-753. 3 fig, 1 tab, 12 ref. NSF AG 199,40-193-69.

Descriptors: *Clear-cutting, *Reforestation, *White pine trees, *Cations, *Forest soils, Hardwood, Deciduous forests, North Carolina, Nutrient requirements, Hydrogen ion concentration, Sodium, Potassium, Calcium, Magnesium, Cation exchange, Soil horizons.
Identifiers: Coweeta Hydrologic Laboratory(NC).

Soil studies were conducted in a deciduous hardwood forest and a white pine plantation established after clear-cutting and decay of previous vegetation at the Coweeta Hydrologic Laboratory, North Carolina. Soil under the pine forest, which had been planted 14 years after clear-cutting and was 15 years-old, differed from the control hardwood forest soil in the opposite direction to that expected, based on relative nutrient demands of young pine and mature hardwood forests. Pine soil pH was 5.8 most of the year and was very well buffered, while hardwood soil pH was below 5.0. Sodium levels were similar, but potassium was higher in the hardwood soil, and calcium and magnesium were higher in the pine soil. Calcium took up 1/3-1/2 the total cation exchange capacity of pine soil. Cation exchange capacity and percent base saturation were significantly higher in pine soil; these characteristics produced a buffering effect resulting in less variable pH in pine soil. Differences in calcium, pH, and base saturation between the two soils can probably be attributed primarily to calcium input from clear-cutting and decay of plant biomass in the pine ecosystem. Soil calcium, pH, and base saturation in the pine forest should decrease to a lower steady-state level in time. (See also W76-10266) (Buchanan-Davidson--Wisconsin)
W76-10322

EFFECTS OF FOREST FIRES ON ATMOSPHERIC LOADS OF SOLUBLE NUTRIENTS,
Colorado Univ., Boulder. Dept. of Environmental, Population, and Organismic Biology.
W. M. Lewis.

In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 833-846. 2 fig., 3 tab., 35 ref. AEC AT(38-1)-819.

Descriptors: *Nitrogen cycle, *Forest fires, *Cycling nutrients, *Pine trees, Litter, Cations, Sulfates, Phosphates, Silicates, Carbon, Hydrogen, Oxygen, Nitrogen, Organic matter, Inorganic compounds, Hydrogen ion concentration, Conductivity, Solubility, Nitrates, Nitrites, Ammonia, Precipitation(Atmospheric), Phosphorus.
Identifiers: Longleaf pine.

Output of soluble substances from fires in longleaf pine litter by volatilization and particulate emission was determined by burning under controlled conditions. After combustion water-soluble substances released by the fire were extracted from the air. Combustion did not produce significant amount of airborne cations, sulfates, orthophosphates, or reactive silicates but volatilized carbon, hydrogen, oxygen, and nitrogen in the form of soluble organic and inorganic nitrogen compounds. These combustion products lowered the pH and conductance of water used in extraction. Approximately one-third of the unburned litter nitrogen content was released; most nitrogen was not recovered as fixed inorganic nitrogen. No nitrates were produced, but nitrite concentration was very high. Total nitrite and ammonia release from litter forest fires was approximately equal to two-thirds the yearly input of fixed nitrogen in rain. Field fires consume more fuel and burn hotter, thus volatile fixed nitrogen output would increase; therefore forest fires could increase regional and global atmospheric fixed nitrogen supplies. Atmospheric links of the nitrogen and possibly the phosphorus cycle are affected by open burning of forest materials and may be a source of atmospheric nutrients. Over long periods rainfall can be important in determining the nutrient inventory of the standing crop. (See also W76-10266) (Buchanan-Davidson--Wisconsin)
W76-10328

THE EFFECT OF URBAN LAND USE ON NUTRIENT AND SUSPENDED-SOLIDS EXPORT FROM NORTH FLORIDA WATERSHEDS,
Florida State Univ., Tallahassee. Dept. of Oceanography.
R. R. Turner, R. C. Harris, T. M. Burton, and E. A. Laws.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 868-888. 3 fig., 4 tab., 30 ref.

Descriptors: *Land use, *Nutrients, *Suspended solids, *Storm runoff, *Urban runoff, Forest watersheds, Urbanization, Florida, Agricultural watersheds, Temporal distribution, Streamflow, Dissolved solids, Nitrates, Ammonia, Nitrogen, Nitrites, Phosphorus, Silca, Water quality control, Storm water.
Identifiers: Lake Jackson(Fla).

Two watersheds near Lake Jackson, Florida, representing forested-agricultural and residential-commercial land use were hydrologically instrumented to study nutrient and suspended solids export. Large differences in size and temporal distribution of nutrient and suspended solids concentrations and exports in storm runoff were observed. Urbanization increased peak stream discharge; total stream discharge volume; mean dissolved solids, nitrate, and ammonia concentrations under all streamflow conditions; mean suspended solids, dissolved solids, nitrate-nitrogen, nitrite-nitrogen, ammonia-nitrogen, and orthophosphorus concentrations under storm-flow conditions; stream water composition variability under all streamflow conditions; storm dissolved and suspended constituent export rates; total storm export of dissolved and suspended constituents except dissolved silicon; and relative significance of storms as transport mechanisms. It decreased mean dissolved silicon under all streamflow conditions and mean suspended solids, orthophosphorus, and total dissolved phosphorus concentrations under low streamflow conditions. Urban runoff water quality criteria should be based on loading rates and concentrations. Urban water quality monitoring systems should sample complete storm hydrographs. Plans for beneficial storm water use may have to include differential collecting systems to be effective. (See also W76-10266) (Buchanan-Davidson--Wisconsin)

RETENTION OF METALS IN SEWAGE SLUDGE II: INCORPORATED RADIOISOTOPES,
Agricultural Research Service, Beltsville, Md. Agricultural Environmental Quality Inst.
J. V. Lagerwerff, G. T. Biersdorf, and D. L. Brower.
Journal of Environmental Quality, Vol. 5, No. 1, p 23-25, January-March, 1976. 5 tab, 20 ref.

Descriptors: *Metals, *Sewage sludge, *Radioisotopes, Analytical techniques, Sludge analysis, Sampling, *Pollutant identification, Waste water treatment.

Digested sewage sludge samples from Washington, D. C., and Baltimore, Maryland, were columned and leached for up to 240 hr with 0.06 N calcium chloride, as well as with water, to study the release of trace amounts of strontium 85 and cesium 137 introduced earlier. Other sludge samples were subjected to hydrogen peroxide treatment and steambath drying, then to incubating with strontium 85 and cesium 137, and either exhaustive water leaching or equilibration with 0.01 N hydrochloric acid or water for one hr. In terms of the original radioactivity, pretreatment increased release of cesium 137 by water leaching between 9 and 18%, and between 7 and 10% for Baltimore and Washington sludge, respectively, depending on whether pretreatment was with water or 3% hydrogen peroxide. For strontium 85, the corresponding ranges were 47 and 55%, and 41 and 48%. Incubation of sludge at room temperature for 44 mo increased water extractability of both cesium 137 and strontium 85 slightly when the material incubated was kept dry. This effect may have resulted from smaller complexing orgaic compound concentrations, or compounds with less complexing ability. The isotopes extractability with hydrochloric acid sharply increased when sludge was moist. This effect would also indicate more organic complexes when storage conditions were moist, since a pH decrease affects their stability. (Snyder-FIRL)

OPTIMAL ALLOCATION OF MEASUREMENT AND CONTROL RESOURCES WITH APPLICATION TO RIVER DEPOLLUTION,
Columbia Univ., New York. Dept. of Mechanical Engineering.
N. M. Olgac, C. A. Cooper, and R. W. Longman.
IEEE Transactions on Systems, Man, and Cybernetics, Vol. SMC-6, No. 5, p 377-384, May, 1976. 6 fig, 24 ref.

Descriptors: *Model studies, Rivers, *Water pollution control, *Aeration, Dissolved oxygen, Biochemical oxygen demand, Costs, Waste discharge, Equations, *Pollutant identification.

Under suitable circumstances, artificial instream aeration is the preferred abatement method for river pollution. An optimal aeration strategy was developed operating on measurements of dissolved oxygen (DO) and biochemical oxygen demand (BOD). DO measurements, which are relatively inexpensive and essentially instantaneous, were modeled as having no cost or time lag. Constraints in measurement of BOD are contamination by noise, time lag, and expense of collecting data. Partial differential equations describe the relationship between DO, BOD, effluent discharges, and artificial aeration. Without loss of generality, this distributed parameter control problem was transformed into a set of lumped parameter control problems along characteristic lines of the original partial differential equations. A model resulted which is adequate for arbitrary temporal and spatial distributions of effluent discharge and variable river cross sections. This ordinary differential equation model was transformed to a discrete time model because of the inherently discrete nature of the BOD measurements. The model includes uncertainty in the a priori knowledge of effluent source rates and in all water quality measurements. Optimal assignment of valuable efforts between aeration and measurement of BOD was made in terms of this model. This optimal strategy is independent of the measurement values. Numerical calculations were also made indicating how BOD measurements can be best located along a river. The dependence of the

ptimal measurement strategy upon observation oise variance and time lag were numerically in-estigated. (Snyder-FIRL)

. K. Wang, and M. H. Wang.
n: Proceedings of the 22nd Annual Technical leeting of the Institute of Environmental ciences, April 26-28, 1976, Philadelphia, Pennsyl-ania, p 548-552. 3 fig, 1 tab, 6 ref.

escriptors: *Biochemical oxygen demand, Model studies, *Mathematical models, Oxygen, rganic compounds, Nitrogen compounds, Com-uter models, *Computer programs, *Pollutant lentification.
lentifiers: Carbonaceous oxygen demand, itrogenous oxygen demand.

computer program was developed for the deter-ination of the first-stage biochemical oxygen de-and (BOD), the deoxygenation constant, and the orrelation coefficient of the BOD mathematical odel. BOD is defined as the quantity of oxygen tilized in the biochemical oxidation of organic atter in a specified time at a specified tempera-re. It is used to measure the concentration of or-anic pollutants. If an organic waste contains only arbonaceous matter, its ultimate carbonaceous xygen demand (UOD), also called the first-stage OD, is a constant. The oxygen needed to oxidize e ammonia formed when organic matter contain-g nitrogen is oxidized is the nitrogenous oxygen emand (NOD), also called the second-stage BOD. relatively simple mathematical model for BOD, volving a linear plot, can be used to obtain UOD nd the deoxygenation constant and the UOD and etermining the correlation coefficient. The first ubroutine derives the slope and intercept of the near plot. Results are given for a set of experimental data used as an example. (See also W76-10022) (Snyder-FIRL)

Water Research, Vol. 10, No. 5, p 437-441, 1976. 1 fig, 4 tab, 4 ref.

Descriptors: *Surfactants, *Pollutant identification, *Phosphate, *Spectrophotometry, *Detergents, Cations, Anions.
Identifiers: *Extraction method.

The effects of surfactants on determination of phosphate in water and waste water were studied. The surfactants investigated included pure cationic, anionic, and nonionic detergents; industrially prepared detergents; and a soap. Ascorbic acid and stannous chloride spectrophotometric methods and isobutyl acetate extraction were used for determining phosphate. For the spectrophotometric methods, the interference was very large for the cationic detergent but negligible for the biodegradable anionic detergents. The ascorbic acid method, which is simple and elegant, is recommended for routine determination of phosphate in most waters and waste waters containing surfactants. The results show that the standard addition procedure for the extraction method can be used only when the approximate surfactant concentration is known. Cationic and nonionic detergent levels must not exceed 2 and 10 ppm, respectively, but biodegradable anionic detergents do not interfere to at least 1000 ppm. However, compounds present in formulated detergents interfere badly. The extraction method should only be used with samples of at least 50 ml containing no more than 8 ppm of pure detergent. AN INSTRUMENT WITH INTERNAL CALIBRATION FOR MONITORING CHLORINE RESIDUALS IN NATURAL WATERS,
National Bureau of Standards, Washington, D. C.
G. Marinenko, R. J. Huggett, and D. G. Friend.
Journal of the Fisheries Research Board of Canada, Vol. 33, No. 4, p 822-826, April, 1976. 2 fig, 3 tab, 5 ref.

Descriptors: *Monitoring, *Chlorine, *Iodine, *Laboratory tests, *On-site investigations, *Pollutant identification, Rivers, Instrumentation.
Identifiers: Chlorine residuals.

A more sensitive field monitor was developed for low level chlorine concentrations. Iodine, resulting from oxidation of potassium iodide by chlorine residual, is measured amperometrically using a platinum microelectrode and a saturated calomel electrode. In the calibrator cell, which operates only when the system is being calibrated, a known amount of iodine is generated by coulometrically oxidizing iodide to iodine, the result being exactly the same as the reaction of chlorine with iodide in aqueous media. The water sample flows at a constant, known rate through the monitor, so that the ratio of electrically generated iodine flux to the water flux corresponds to the iodine concentration. Laboratory tests on the monitor included measurements of repeated quantitative dilutions of tap water and a solution prepared from commercial bleach. Field tests were performed during non-emergency conditions in streams in northern Maryland and during a fish kill in the James River. Data obtained indicated that the new instrument can measure chlorine concentrations down to a few parts per billion. It is portable and has direct read-out display in either microamperes or ppm of residual chlorine. (Snyder-FIRL)

POLLUTION MONITORING DOESN'T HAVE TO BE COSTLY,
Hewlett-Packard Co., Loveland, Colo.
V. Hebert.
Instruments and Control Systems, Vol. 49, No. 4, p 27-30, April, 1976. 6 fig.

Descriptors: *Monitoring, *Water pollution control, *Pollutant identification, Automation, Data collections, Waste water treatment, Data processing.
Identifiers: Data acquisition systems.

Automatic data acquisition systems (DAS) controlled by programmable calculators can effectively monitor pollution control systems. Electrical signals from transducers can be processed in the calculator. Pollution control monitoring includes legally required monitoring, monitoring which is necessary for engineering reasons, and informative monitoring which is helpful in running the system. A calculator based data acquisition system is used for pollution control monitoring at an electronic equipment plant. Automated systems are used to treat the diluted waste in rinse waters, but concentrated process wastes are treated under the direct control of a trained operator. The DAS gathers two kinds of information: the time and date of the data and the data itself. The signals from the transducers are analog signals, but a voltmeter converts them to digital information which the calculator can understand. The DAS can generate written data reports. The calculator based DAS has other potential applications, is versatile and easy to program, and is economically competitive with other systems that perform fewer functions. (Snyder-FIRL)

POTENTIOMETRIC DETERMINATION OF LOW LEVELS OF SIMPLE AND TOTAL CYANIDES,
Canada Centre for Inland Waters, Burlington (Ontario).
I. Sekerka, and J. F. Lechner.

Descriptors: *Heavy metals, *Pollutant identification, *Electrodes, *Potentiometers, Irradiation, Measurement.
Identifiers: *Cyanides.

A method was developed to determine simple and total cyanide concentrations by manual or automated direct potentiometry using a cyanide ion-selective electrode and the addition-known dilution technique. Samples for either simple or total cyanide determination must be treated chemically before measurement, and samples for total cyanide determination must also be irradiated with ultraviolet light. The method was used to determine cyanide ion down to 2 ppb. A procedure was developed to eliminate the interference caused by ions forming little-soluble salts of silver. Since cyanide in acid solution exists as dissolved hydrogen cyanide gas, which is not sensed by the electrode, only the apparent cyanide due to the interfering salts is determined by measuring at pH 2 to 3. This value is subtracted from cyanide measurements at pH 11.5 to determine the real cyanide concentration. The method is simple and efficient, and results obtained using it compare well with those obtained by a conventional method. (Snyder-FIRL)

APPLICATION OF A COMPUTER-BASED CHROMATOGRAPH FOR AUTOMATED WATER POLLUTION ANALYSES,
New Orleans Univ., La. Dept. of Biological Sciences.
B. Dowty, L. Green, and J. L. Laseter.
Journal of Chromatographic Science, Vol. 14, No. 4, p 187-190, April, 1976. 5 fig, 15 ref.

Descriptors: *Pollutant identification, *Gas chromatography, *Automation, *Organic compounds,

Analytical techniques, Measurement, Water analysis, Equipment, Monitoring, Separation techniques, Computer programs, Polymers.
Identifiers: Adsorbents.

An automated, computer-based gas chromatographic technique for the analysis of low molecular weight volatile organics extracted from drinking water by a modified headspace technique is described. The volatile organics are thermally desorbed from the water sample and displaced into the head-space by purging the sample with ultrapure helium. These displaced organics are then adsorbed on a polymer (Tenax-GC) material which is packed in a glass liner which in turn fits into a modified injection port of chromatograph. A Hewlett-Packard reporting gas chromatograph is modified to allow automated collection of volatile organics and their subsequent resolution by capillary chromatographic methods. On line data collection and reduction are achieved by a digital processor incorporated into the chromatograph. Commands establishing operating parameters and methods of data treatment are given via a keyboard. Automation of the procedure results in improved data reproducibility, with consecutive chromatograph analyses of the same sample showing retention time variabilities in the 0.01-0.1 sec range. The automated procedure can also be used to monitor industrial plant effluents and waste water treatment processes. (Kreager-FIRL)

CHEMICAL HAZARDS RESPONSE INFORMATION SYSTEM, A CONDENSED GUIDE TO CHEMICAL HAZARDS,
Coast Guard, Washington, D. C. Office of Marine Environment and Systems.
W. M. Benkert.
Available from the National Technical Information Service, Springfield, Va 22161, as AD/A-002 390, $12.00 in paper copy, $2.25 in microfiche. Report CG-446-1, January, 1974. 437 p, 400 tab.

Descriptors: *Water pollution, *Toxicity, *Coast Guard regulation, *Chemicals, Water pollution sources, Chemical industry, *Safety, *Public Health, *Poisons, Ships, Inorganic compounds, *Chemical properties, Chemical wastes, Organic compounds, Human pathology, Transportation, Barges, Access routes, Navigation, Information exchange, Pollutant identification.
Identifiers: *Chemical hazards.

A condensed guide to chemical hazards is provided as guidance for proper decision making by responsible Coast Guard personnel. It also provides certain basic non-emergency related information to support Coast Guard effort to achieve improved levels of safety on the bulk shipment of hazardous chemicals. Included is: technical name, common synonums, physical characteristics of substance, emergency procedures, fire procedures, human exposure considerations and water pollution effects. (Katz)

Identifiers: *Meiofauna, *Mediteranean, Moro co, Algeria, Tunis Tidal Beaches, Atidal Beaches

Quantitative samples of interstitial sand beac meiofauna were collected from Morocco along t North African coast and north to Lebanon, Tu key, and Cyprus. Data on the sediment media diameter, sorting coefficient, and beach temper ture were used to construct multiple-regressio equations relating these factors to total meiofaun numbers. For the tidal beach equations sorting w the most important factor followed by temperatu and median diameter. It is suggested that the fa tors controlling meiofaunal abundance on the beaches are likely to be wave, tide and current a tion which also control sorting. Biological intera tions on atidal beaches may cause the poor fit the data to the model. Regression techniques ma be useful in pollution detection. (Katz)

DESIGN A RIVER BASIN SAMPLING SYSTEM,
Massachusetts Univ., Amherst. Dept. of Civil Engineering.
T. G. Sanders, B. B. Berger, and D. D. Adrian.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-255 022, $5.00 in paper copy, $2.25 in microfiche. Massachusetts Water Resources Research Center, Amherst, Publication No. 62, Completion Report FY-76-9, March 1976. 88 p, 12 fig, 14 tab, 77 ref. OWRT A-041-MASS(4) 14-31-0001-4021.

Descriptors: *Sampling, *Design criteria, *Pollutant identification, *River basins, Water quality, *Time series analysis, *Frequency, Streams.

The major objectives were: (1) To develop criteria to be used for specifying the number of sampling points in a river basin and their longitudinal, lateral and vertical location. (2) To develop criteria which would specify the frequency of sampling for baseline concentrations and year-to-year trends. The general location of sampling stations was specified by means of a stream numbering system. This location, termed the macrolocation, was then further refined by considerations of upstream discharges which might influence the longitudinal, lateral and vertical variation in pollutant concentrations. A representative sample of water quality in the stream's transect may require compositing samples withdrawn from various portions of the stream. A time series model was used to determine trends and to investigate the efficacy of various sampling frequencies.

THE MEASUREMENT OF ADENOSINE TRIPHOSPHATE IN PURE ALGAL CULTURES AND NATURAL AQUATIC SAMPLES,
Geological Survey, Doraville, Ga.
W. T. Shoaf, and B. W. Lium.
Journal of Research of the U S Geological Survey, Vol 4, No 2, p 241-245, March-April 1976. 3 fig, 4 tab, 9 ref.

Descriptors: *Chemical analysis, *Algae, Natural streams, *Analytical techniques, Sampling, Preservation, Methodology, Biochemistry, Biomass, Aquatic microbiology, Measurement, *Pollutant identification, *Separation techniques.
Identifiers: *Adenosine triphosphate.

Three methods for the extraction of adenosine triphosphate (ATP)--neutral dimethyl sulfoxide (DMSO), boiling tris buffer, and butanol-octalol extraction--were equally effective on the alga Chlorella vulgaris. Dilution of extracted ATP samples was linear. Filtration of different volumes of samples resulted in proportional values for ATP in the extracts. Measurement of activity by either peak height of integration of the area under the peak were equally sensitive and reproducible. The assay of ATP sample was inhibited by mercuric chloride >cadmium chloride >calcium chloride >potassium or sodium phosphate, and by high concentrations of the extractant DMSO. Analysis of ATP in aquatic environments led to the problem of transferring a sample from the field to the laboratory without obtaining a change in ATP concentration. Quick freezing by immersion of filter and algae in liquid nitrogen and storage on dry ice maintained a constant ATP level. Field extraction of the ATP followed by quick freezing in an acetone--dry ice bath maintained the ATP in a convenient and stable form. (Woodard-USGS)

CONTINUOUS RESPIROMETER APPARATUS FOR MONITORING SEWAGE OXYGEN CONTENT.
Robertshaw Controls Co., Richmond (Australia). (Assignee).
Australian Patent 470,334. Issued March 11, 1976. Official Journal of Patents, Trade Marks and Designs, Vol. 46, No. 8, p 773, March, 1976.

Descriptors: *Sewerage, Analytical techniques, *Oxygen, *Monitoring, *Patents, Dissolved oxygen analyzers, Measurement, Aeration, *Pollutant identification, Waste water treatment.
Identifiers: *Respirometers.

A continuous respirometer apparatus to monitor the oxygen contained in sewage in a holding area was patented. It includes a continuous closed flow path formed on its upstream end with an inlet sensing area, and an outlet sensing area on its downstream end. A residence chamber is defined, having a known volume. A pre-aeration vessel is included with an outlet connected to the inlet in the closure area and an inlet for receiving the fluid. Means are included to introduce oxygen to the pre-aeration vessel to add oxygen to the fluid. Outlet and inlet probes sensing oxygen content are disposed in the outlet and inlet sensing areas to continuously sense the oxygen content of the sewage flowing through the outlet and inlet areas. The invention includes supply conduits that lead from the holding area to the pre-aeration vessel inlet to deliver sewage. Dump conduits lead from the outlet sensing area. Sewage delivery equipment continuously delivers sewage to the inlet sensing area. The sewage delivery rate is predetermined to maintain the volume filled and to provide a known residence time required for the sewage to flow between the inlet probe and outlet probe. The means for sewage delivery may be actuated for continuous delivery to the inlet sensing area, also causing flow of the sewage from the inlet probe to the outlet probe while isolated from ambient oxygen and causing the probes to indicate the oxygen content of the sewage at both the outlet and inlet sensing areas. (Snyder-FIRL)

BIODEGRADABILITY--AN IMPORTANT CRITERION FOR THE ENVIRONMENTAL COMPATIBILITY OF SURFACTANTS AND OTHER PRODUCT COMPOUNDS,
Henkel and Cie G.m.b.H., Duesseldorf (West Germany).
W. K. Fischer.
La Rivista Italiana Delle Sostanze Grasse, Vol. 52, No. 11, p 373-376, November, 1975. 3 fig, 6 tab, 1 ref.

Descriptors: *Pollutant identification, Analytical techniques, *Biochemical oxygen demand, *Chemical oxygen demand, *Carbon dioxide, Organic matter, Organic compounds, Carbon, Activated sludge, *Biodegradation, Water quality standards.
Identifiers: Total organic carbon, Dissolved organic carbon.

Biodegradability is increasingly required by national laws and international directives. The biodegradability testing of anionic surfactants stimulates either the self-purification of surface waters or biological sewage treatments in activated sludge plants in static and continuous flow systems. Biodegradability is being demanded increasingly for all organic product components. These demands pose new problems in testing methodology, international comparability, practical relevance of the results, and definition of official minimum requirements. A test combination has been developed consisting of successive application of a screening test and a model sewage treatment plant test; it permits the biodegradability evaluation of organic compounds by means of generally applicable summary parameters. The biodegradation of all organic materials can be determined via the biochemical oxygen demand (BOD) with the Closed Bottle Test. Similar determinations can be made via chemical oxygen demand (COD), total organic carbon (TOC), dissolved organic carbon (DOC) and carbon dioxide with the modified Closed Bottle Test using pure oxygen saturation. The low concentrations used in the conventional Closed Bottle Test make it useful only for BOD. If these screening tests yield low or questionable degradation rates, a modified confirmatory test especially suited to summary parameters is used to establish the elimination rates attainable under sewage treatment conditions. In the continuous activated sludge test, biodegradability may be observed by comparing values of COD, TOC, or both in coupled activated sludge units. (Snyder-FIRL)
W76-10235

DETERMINATION OF THE CHEMICAL OXYGEN DEMAND (COD) BY POTASSIUM DICHROMATE AT VERY HIGH CHLORIDE CONCENTRATIONS (BESTIMMUNG DES CHEMISCHEN SAUERSTOFFBEDARFS (CSB) GEGEN KALIUMDICHROMAT BEI SEHR HOHEN CHLORIDKONZENTRATIONEN),
U. Zietz.
Gas-und Wasserfach-Wasser/Abwasser, Vol. 117, No. 4, p 181-184, 1976. 1 tab, 10 ref.

Descriptors: *Chemical oxygen demand, *Potassium compounds, Analytical techniques, *Chlorides, *Chemical precipitation, Solubility, Axidation, Aqueous solutions, *Pollutant identification.
Identifiers: Potassium dichromate.

A modification of the potassium dichromate method for the determination of the chemical oxygen demand (COD) at very high chloride concentrations without the use of mercury compounds is described. The determination requires closed vacuum flasks for the analysis. Chlorides are quantitatively precipitated in the form of silver chloride. The small chloride concentration resulting from the solubility product of silver chloride is oxidized by the potassium dichromate. The chlorine concentration in the gaseous phase over the solution is negligible. The method is suitable for the determination of even very low COD values. (Takacs-FIRL)

ANALYTICAL NOTES--ELECTROCHEMICAL METHOD FOR EARLY DETECTION AND MONITORING OF COLIFORMS,
National Aeronautics and Space Administration, Langley Station, Va. Langely Research Center.
J. R. Wilkins, and E. H. Boykin.
American Water Works Association Journal, Vol. 68, No. 5, p 257-263, May, 1976. 4 fig, 4 tab, 11 ref.

Descriptors: *Analytical techniques, *Pollutant identification, *Electrochemistry, *Hydrogen, *Coliforms, Estuaries, Freshwater, Evaluation, Metabolism, Measurement, Aquatic microorganisms.
Identifiers: *Electrochemical methods, Fecal coliforms.

An electrochemical method for the detection and monitoring of coliforms in naturally contaminated estuarine and fresh water samples was evaluated. The method was based on the observation that the inoculum size was directly related to the time period required for the detection of hydrogen which is evolved by coliforms as a result of lactose metabolism. Standard methods of coliform analysis were performed on fresh water and estuarine samples, and membrane filtration counts were used to construct dose-response curves. Samples containing coliforms in the range of 100-1000/100 ml were detected in 6.2-8.5 hr for total coliforms in estuarine or fresh water samples, 3.5-6.5 hr for fecal coliforms in estuarine water, and 5.0-7.0 hr for fecal coliforms in fresh water samples. (Kreager-FIRL)

ANIONIC AND NON-IONIC SURFACTANT BIODEGRADATION IN A PURIFYING PLANT USING ACTIVATING MUDS (BIODEGRADAZIONE DE TENSIOATTIVI ANIONICI E NON-IONICI IN UN IMPIANTO DI TRATTAMENTO A FANGHI ATTIVATI),
Stazione Sperimentale Oli e dei Grassi, Milano (Italy).
C. Ruffo, and A. Arpino.
La Rivista Italiana delle Sostanze Grasse, Vol. 52, No. 11, p 383-386, November, 1975. 9 tab, 8 ref.

Descriptors: *Waste water treatment, *Pollutant identification, *Sewage treatment, *Activated sludge, *Sewerage, Treatment facilities, Surfactants, Muds, *Biodegradation.

Since surfactant-containing sewage must be adequately purified before final dumping sewage sampled both downstream and upstream of a purification plant using activated sludge was analyzed. The treatment removed more than 80% of both non-ionic and anionic surfactants. This situation indicates that biodegradable products are in use in Italy, as required by existing regulations. These results agree with those obtained by this research team in 1973, when despite drastically increased detergent consumption, surfactant concentration levels had not significantly risen since 1964. (Snyder-FIRL)

ANALYZING FOR ASBESTOS IN DRINKING WATER,
Municipal Environmental Research Lab., Cincinnati, Ohio.
J. R. Millette.
News of Environmental Research in Cincinnati, p 1-4, January 16, 1976. 4 fig.

Descriptors: *Pollutant identification, *Analytical techniques, *Asbestos, *Potable water, *Electron microscopy, Asbestos cement, Public health, Concrete pipes, Water conveyance, Water supply.

Although the health effects of asbestos fibers in drinking water currently are not known, sufficient concern exists that the levels should be investigated. An electron microscope is used for routine asbestos analysis because it can be used to identify fibers by crystal structure, morphology, and elemental composition. Samples from throughout the country were analyzed, indicating that a few municipal water supplies have relatively high asbestos levels, and that water with certain chemical characteristics may cause asbestos fibers to be released from asbestos cement pipe into water systems. IMPORTANT ASPECTS OF PHOSPHORUS ANALYSIS,
Allied Chemical Corp., Morristown, N. J.
H. E. Zuern.
Water and Sewage Works, Reference number, p R-52-R-53, April 30, 1976. 1 ref.

Descriptors: *Phosphorus, *Analytical techniques, *Colorimetry, *Pollutant identification, *Waste water(Pollution), Organophosphorus compounds, *Phosphates.
Identifiers: Ortho phosphate, Poly phosphates, Sample preparation, Digestion techniques.

Methods for the analysis of phosphorus in waste water are reviewed. All poly and organic phosphates must first be converted to ortho phosphate in order to determine the phosphorus content of a waste water sample. This is done by digesting the sample through chemical addition and heating. Three digestion techniques are suggested in Standard Methods: perchloric acid, sulfuric-nitric acid, and persulfate. The persulfate method is recommended for most waste water laboratories since it involves minimum hazards. After the digestion procedure, samples are checked for clarity to determine if filtering or centrifuging is necessary prior to colorimetric phosphorus determination. Suitable colorimetric methods include: the stannous chloride method which has a useful range of 0.007-2.0 mg/liter, the ascorbic acid method which has a useful range of 0.03-2.0 mg/liter, and the vanadomolybdophosphoric method which has a useful range of 0.75-20 mg/liter. The last method requires only one chemical for color development and is suitable for most field work where minute accuracy is not required. The stannous chloride method is preferred when small quantities of phosphorus (less than 2.0 mg/liter) are to be determined. (Kreager-FIRL)

POLLUTANT ANALYSIS COST SURVEY,
National Bureau of Standards, Washington, D. C.
B. Greiler, and J. K. Taylor.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-241 991, $7.75 in paper Copy, $2.25 in microfiche. Report EPA 650/2-74-125, December 1974, 196 p, 4 fig, 30 tab, 186 ref.

Descriptors: *Pollutant identification, *Water pollution, *Industrial wastes, *Testing, *Cost analysis, Spectrophotometry, X-ray fluorescence, Spectroscopy, Polarographic analysis, *Trace elements.
Identifiers: Emission spectroscopy, Electron probes, Polarography.

Various approaches to chemically analyzing heavy industrial process materials and effluents for trace elements possibly contributing to environmental pollution are summarized. The costs and capabilities of nuclear methods, spark source spectrometry, atomic absorption spectrometry, voltammetry, and potentiometry are assessed for determining traces of mercury, beryllium, cadmium, arsenic, vanadium, manganese, nickel, antimony, chromium, zinc, copper, lead, selenium, boron, fluorine, lithium, silver, tin, iron, strontium, sodium, potassium, calcium, silicon, magnesium, uranium, and thorium in matrices such as fly ash, oil, coal, ores, minerals, metals, organometallics, alloys, slurry streams, incinerator particulates, and feeds of sedimentation processes. A selected bibliography is included and the Standard Reference Materials available for environmental analysis are reviewed. This report revises and extends the 'Survey of Various Approaches to the Chemical Analysis of Environmentally Important Materials,' which it supersedes. (Snyder-FIRL)
W76-10259

WATER POLLUTION SAMPLER EVALUATION,
Army Medical Bioengineering Research and Development Lab., Fort Detrick, Md.
J. J. Barkley, K. M. Peil, and J. W. Highfill.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-A009 079, $6.75 in paper copy, $2.25 in microfiche. Technical Report 7501, January, 1975, 162 p. 24 fig, 39 tab, 6 ref, 5 append.

Descriptors: *Pollutant identification, *Analytical techniques, *Instrumentation, Sanitary engineering, *Water sampling, Laboratory tests, Testing procedures, Publications, Equipment.
Identifiers: *Sampler evaluation.

Standardized solutions and testing procedures for evaluating water and waste water samplers were studied. The ability of existing portable sampler to obtain representative samples of various waste water constituents under various physical limitations was evaluated. Sixteen samplers, representing the various types available, were tested with synthetic waste waters consisting of six classes of naturally occurring constituents. Test physical constraint included lift, temperature and sampling duration. Samplers were evaluated as to ease of operation representativeness of sample, and relation to a predefined ideal sampler and ranked as to overall performance. Only refrigerated samples maintained the level of biodegradable material. Gas-operated samplers inhibited bacterial viability in the sampled media, either because of the Freon or the rease associated with Freon. Collection velocity, constrictions, reductions or tees in the flow system, and screens or small holes in the inlet device influence the ability of a sampler to collect suspended solids. Temperature, time, and lift apparently do not significantly affect the collection or maintenance of colloids. No sampler was found efficient for sampling dissolved oxygen. Nonrepeatable result were obtained for the volatile organic class, possibly due to the fact that ambient temperature was not controlled and shortcomings in analytical procedure. Self-purging samplers were generally more efficient than non-purging models. (Snyder-FIRL)

EFFECTS OF AGE, SEX, AND PELAGE PHENOTYPE ON THE ELEMENTAL COMPOSITION OF THE OLD-FIELD MOUSE,
Savannah River Ecology Lab., Aiken, S. C.
G. A. Kaufman, and D. W. Kaufman.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 518-527. 3 tab., 20 tab., 20 ref. AT(38-1)-310, AT(38-1)-819.

Descriptors: *Trace elements, *Small animals(Mammals), Analysis, *Chemical properties, *Rodents, Laboratory animals, Bioassay, Calcium, Phosphorus, Potassium, Sodium, Magnesium, Iron, Zinc, Aluminum, Manganese, Strontium, Boron, Molybdenum, Sulfur, Southeast U.S., Cycling nutrients, *Pollutant identification. Identifiers: Mice, *Pelage phenotype.

Effects of age, sex, and two naturally occurring pelage phenotypes (dark and light brown) on whole-body elemental composition were analyzed in nonreproducing laboratory-raised old-field mice from 0 to 42 days-old. Their effects on dry weight, live weight, lean-dry- and lean-live-biomass concentrations of calcium, phosphorus, potassium, sodium, magnesium, iron, zinc, sulfur, aluminum, manganese, strontium, boron, molybdenum, and barium were studied, using analysis by variance. Age was the most important factor affecting concentrations of these elements; sulfur expressed as dry- and lean-dry-biomass concentrations and sodium expressed as live- and lean-live-biomass concentrations were not significantly changed by age. Sex significantly affected potassium and zinc when expressed as dry weight concentrations but did not affect any element when expressed as live-weight or lean-dry- or lean-live-biomasses. Pelage phenotype significantly affected strontium when expressed as live-weight or lean-dry- or lean-live-biomass concentrations but not when expressed as a dry-weight concentration, and had no effect on other elements. The variability due to age (size) should be removed before effects of other variables are studied and form of concentrations expression should be considered. PREDICTION OF ELEMENTAL CONTENT IN THE OLD-FIELD MOUSE,
Savannah River Ecology Lab., Aiken, S. C.
D. W. Kaufman, and G. A. Kaufman.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 528-535. 3 tab., 11 ref. AT(38-1)-310, AT(38-1)-819.

Descriptors: *Rodents, *Physicochemical properties, Analysis, *Small animals(Mammals), *Trace elements, Calcium, Phosphorus, Potassium, Sodium, Magnesium, Iron, Zinc, Aluminum, Sulfur, Manganese, Strontium, Boron, Molybdenum, Barium, Laboratory animals, Bioassay, Forecasting, Regression analysis, Chemical properties, Southeast U.S., Cycling nutrients, *Pollutant identification.
Identifiers: Mice.

Changes in elemental contents of laboratory-raised old-field mice from 0 to 6 weeks-old were studied to determine usefulness of live and dry weights in predicting elemental concentrations. Live weight and live-weight concentrations of calcium, phosphorus, potassium, sodium, magnesium, iron, zinc, aluminum, sulfur, manganese, strontium, boron, molybenum, and barium, and between dry weight and dry-weight concentrations of elements were compared as mere correlations or data transformed to natural logarithms. Equations for estimating elements present from mouse live- and dry-weights were used. Live-weight estimators were best for converting field biomass into elemental standing crops. Sodium and potassium were not correlated with live weight nor were phosphorus, iron, and zinc with dry weight. The best elemental content estimated for 0 to 6 weeks-old mice were by predicting natural logarithms of elements from natural logarithms of live weight. For trappable-size mice 3 to 6 weeks-old, average live-weight concentration was the best elemental content estimator. Elemental contents from dry weights of 0 to 6 and 3 to 6 weeks-old mice should be estimated from regression equations relating elements to dry weight logarithms. Nitrogen, magnesium, aluminum, strontium, molybdenum, and barium were lower in laboratory than field-caught animals. Element concentrations were size specific. FATHEAD MINNOWS (PIMEPHALES PROMELAS) AND GOLDFISH (CARASSIUS AURATUS) AS STANDARD FISH IN BIOASSAYS AND THEIR REACTION TO POTENTIAL REFERENCE TOXICANTS,
Minnesota Univ., St. Paul. Dept. of Entomology, Fisheries, and Wildlife.
I. R. Adelman, and L. L. Smith, Jr.
Journal of the Fisheries Research Board of Canada, Vol. 33, p. 209-214, 1976. 3 tab.

Descriptors: *Minnows, *Toxicants, Laboratory tests, *Bioassay, Analytical techniques, *Bioindicators, *Sodium chloride, Methodology, Standards, *Phenols, Variability, Quality control, Water quality control, Lethal limit, Aromatic compounds, *Pollutant identification.
Identifiers: Pimephales promelas, Carassius auratus, Standard procedures, *Reference toxicants, *Goldfish, Guthion(R), Pentachlorophenol.

Fathead minnows (Pimephales promelas) and goldfish (Carassius auratus) were compared for their suitability as standard bioassay fish. Both species showed the same variability of bioassay results when tested with four toxicants. Fathead minnows are recommended on the basis of their small size and on their capability for use in complete life cycle tests. On the basis of minimum variability of bioassay results, sodium chloride was superior for use as a reference toxicant. Both sodium chloride and pentachlorophenol would be acceptable as a reference toxicant. (Katz)

THE IDENTIFICATION OF PHTHALIC ACID ESTERS IN THE TISSUES OF CYPRINODONT FISH AND THEIR ACTIVITY AS HEARTRATE DEPRESSORS,
Oak Ridge National Lab., Tenn.
P. Pfuderer, S. Janzen, and W. T. Rainey, Jr.
Environmental Research, Vol. 9, p. 215-223, 1975. 1 tab., 8 fig., 15 ref.

Descriptors: *Fish physiology, *Chemical analysis, *Bioassay, Water pollution effects, *Absorption, *Carp, *Industrial wastes, *Plastics, Chemical reactions, Spectrophotometry, Analytical techniques, Separation techniques, Laboratory tests, Water pollution sources, Adsorption, Chromatography, Lipids, *Pollutant identification.
Identifiers: Phthalates, Heart rate depressors.

Dioctyl phthalate and butylbenzyl phthalate, isolated from carp liver, exhibited heartrate depressor activity. A pure sample of dioctyl phthalate was not active in the assay, while a sample of butylbenzyl phthalate containing 1.5% dibutyl phthalate was slightly active, probably due to the dibutyl phthalate it contained. Dibutyl phthalate, also found in carp livers, remained active as a heartrate depressor at levels of 5 ppm and higher, in pure form. It is concluded either that traces of a compound that complexes or enhances the activity of dioctyl and butylbenzyl phthalate are responsible for their activity or traces of a more active compound are present with them. Dioctyl phthalate was also shown to form complexes in ethanol with fish lipids, presumably with fish di- and triglycerides. (Katz)

A RELIABLE ALGAL ASSAY PROCEDURE BASED ON PH MEASUREMENTS,
Naval Research Lab., Washington, D.C.
P. J. Hannan.
In: Proceedings of the Conference on Marine Biology in Environmental Protection, held at San Clemente Island, California, on 13-15 November, 1973, December, 1974. p 71-88, 8 fig, 11 ref.

Descriptors: *Bioassay, *Algae, Methodology, Water quality, *Primary productivity, *Hydrogen ion concentration, *Toxicity, *Adsorption, *Absorption, Aquatic productivity, Carbon dioxide, Photosynthesis, Adaptation, Environmental effects, Laboratory analysis, Basic data collections, Mercury, Iron, Zinc.
Identifiers: Scandium, *pH changes, *Algal bioassay, Phaeodactylum tricornutum, Instant Ocean.

An assay method has been devised for laboratory and shipboard use, based on the pH changes associated with CO2 absorption by algae. It can be used to determine differences in water quality, or to rank the relative toxicities of various compounds. The equipment consists of a lighted aquarium with six 1-liter Erlenmeyer flasks containing the test suspensions, a sensitive pH meter, an automatic electrode switch, and a six-point recorder or a digital printer. Growth is monitored for 60 hours, and CO2 absorption for each suspension is calculated from a comparison of pH changes observed during growth of the test

suspension with those found during a titration of an aliquot with standard alkali. Close control of the inoculum concentration and of nutrient concentrations is essential for reproducible results; it has been possible to approach 1 percent accuracy throughout the course of the 60 hours with four duplicate cultures. Because this method provides a continuous measure of growth the data contains useful information concerning the adaptation, or lack of adaptation, of the cells to a toxicant. Adsorption phenomena which play an important role in bioassays with algae and other organisms are also discussed. (See also W76-10353) (Katz)

BYSSAL THREAD PRODUCTION AS A TOXICITY TEST,
Naval Undersea Center, San Diego, Calif.
M. H. Salazar.
In: Proceedings of the Conference on Marine Biology in Environmental Protection, held at San Clemente Island, California, on 13-15 November, 1973, December, 1974. p. 103-116, 1 tab., 4 fig., 4 ref.

Descriptors: *Toxicity, *Bioassay, Physiology, *Mollusks, *Chromium, *Copper, *Mercury, *Zinc, *Sewage, Pelycypods, Mussels, Physiology, Intertidal areas, Methodology, Water quality, Water pollution, Statistical analysis, *Pollutant identification.
Identifiers: *Byssal threads production test.

Byssal thread production in Mytilus edulis decreases significantly when these mussels are stressed by various pollutants. Statistical analysis has shown that this stress can be quantified and used as a reliable measure of toxicity. During the development of this test, the toxicity of heavy metals (lead, chromium, copper, zinc, and mercury), sewage, fuel biocides, synthetic polymers, and oil were evaluated. As it is now conducted the test takes 21 days to complete. Mussels and some other bivalves produce byssal threads to anchor themselves securely to solid substrate. Previous investigators have shown that the number of byssal threads produced by a mussel is a good indicator of general animal health. It was found that byssal thread production in Mytilus edulis and Modiolus demissus decreased when physical factors such as temperature, dissolved oxygen, salinity, pH, and agitation deviated from optimum levels. This study demonstrates a similar decrease when Mytilus edulis is stressed with toxicants. (See also W76-10353) (Katz)

THE ACTIVITIES OF ENZYMES AS POLLUTION INDICATORS,
San Diego State Univ., Calif.
J. H. Mathewson.
In: Proceedings of the Conference on Marine Biology in Environmental Protection, held at San Clemente Island, California, on 13-15 November, 1973, December, 1974, 117-124, 9 ref.

Descriptors: *Crustacean, *Marine animals, *Toxicity, *Bioassay, Methodology, Laboratory methods, Animal physiology, Biochemistry, *Enzymes, Environmental studies, Mercury, Cadmium, *Bioindicators.
Identifiers: *Enzyme activity measurements, California spiny lobster, Panuliris interruptus, Carbonic anhydrase.

Traditional methods for the prediction of the impact of the pollutant on ecosystems rely on the short-term and generally gross response of uniform collection of mature specimens of a single species to relatively massive doses of a contaminant. The accepted concepts of modern ecology and the subtle and often surprising responses of ecosystems to perturbation require more sophisticated analysis. One approach is the determination of the response of key enzymes in exposed or sensitive tissue to environmentally significant levels of pollutants. Two potentially useful systems for the study of marine pollution problems are the carbonic anhydrases controlling carbon dioxide exchange and the cation dependent ATPases controlling ion balances.

Identifiers: Aromatic hydrocarbons, Electrolytic stripping cell, Marine pollution.

This paper describes a head-space method for determining aromatic hydrocarbons in sea water. The hydrocarbons are stripped from sea water, under equilibrium conditions, by very small bubbles of hydrogen gas generated electrolytically from a gold electrode located at the bottom of a cylindrically shaped cell. The hydrocarbon concentration in the sea water is determined from the volume of the sea water and the hydrocarbon concentration in the head-space after a measured volume of hydrogen has bubbled through the stripping cell. (See also W76-10370) (Katz)
W76-10390

DETERMINATION OF AROMATIC AND TOTAL HYDROCARBON CONTENT IN SUBMICROGRAM AND MICROGRAM QUANTITIES IN AQUEOUS SYSTEMS BY MEANS OF HIGH PERFORMANCE LIQUID CHROMATOGRAPHY,
Bermuda Biological Station for Research, St. George's West.
A. Zsolnay.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p 119-120, 2 fig, 7 ref.

Descriptors: *Oily water, Methodology, *Analytical techniques, Analysis, *Waste identification, Oil pollution, Marine water, *Chromatography, *Pollutant identification.
Identifiers: Aromatic hydrocarbon analysis, Total hydrocarbon analysis, Liquid chromatography, Flow colorimeter, Marine pollution.

In order to determine the hydrocarbon concentration in small water samples rapidly and fairly simply, two separate but related methods were developed. Both are based upon the use of high performance liquid chromatography. They are more sensitive than the IR methods, which tend to have a maximum sensitivity of 0.05 mg, and they are probably more specific than UV or fluorescence methods used without column chromatography. Their main advantage over GLC lies in the fact that they are simpler and more rapid for the obtaining of quantitative results. (See also W76-10370) (Katz)

Chevron Oil Field Research Co., La Habra, Calif.
C. D. McAuliffe.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p 121-125, 1 tab, 4 fig, 14 ref.

Descriptors: *Water pollution, Methodology, *Analytical techniques, Analysis, *Gas chromatography, Oily water, Oil pollution, Waste identification, Environment, *Pollutant identification.
Identifiers: Distribution coefficient, Environmental surveys, Equilibrium, Hydrocarbon types, Hydrocarbons in water.

Several fields require the measurement of widely varying concentrations of hydrocarbons dissolved in water. These fields include environmental studies, petroleum exploration, and biochemical research, among others. The method reported here is based on successive gas equilibrations of a hydrocarbon-free gas with an aqueous sample containing dissolved hydrocarbons. All classes of hydrocarbons having up to 11 carbon atoms in the molecule can be determined. (See also W76-10370) (Katz)

SUSPENSIONS OF CRUDE OILS IN SEA WATER: RAPID METHODS OF CHARACTERIZING LIGHT HYDROCARBON SOLUTES,
Battelle Pacific Northwest Labs., Richland, Wash. Ecosystems Dept.
R. M. Bean.
In: NBS, Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p 127-130, 1 tab, 4 fig, 12 ref.

Descriptors: *Oily water, *Oil pollution, Methodology, *Gas chromatography, *Waste identification, Analytical techniques, Analysis, Spectrophotometry, *Pollutant identification.
Identifiers: Crude oil, Suspensions, Insoluble oil, Filtration, Oil solutions, Infrared spectrophotometry.

The purpose of this study was to develop rapid means for analysis of dissolved light hydrocarbons with respect to hydrocarbon type, which would be suitable for characterization of bioassay treatment media and oil/water discharges of a similar nature. To accomplish this, it was necessary to develop methods for sampling at locations remote from analytical instrumentation, and for correlation of hydrocarbon composition with simple spectrophotometric methodology. A rapid gas chromatographic method was developed to determine the light hydrocarbon composition of oil/seawater systems. (See also W76-10370) (Katz)

ANALYTICAL TECHNIQUES FOR ISOLATING AND QUANTIFYING PETROLEUM PARAFFIN HYDROCARBONS IN MARINE ORGANISMS,
National Marine Fisheries Service, Seattle, Wash. Northwest Fisheries Center.
R. C. Clark, Jr., and J. S. Finley.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p. 209-212, 2 tab., 4 fig., 6 ref.

Descriptors: *Oil pollution *Oil spills, *Analytical techniques, Gas chromatography, Pathology, Environmental effects, Waste identification, Mussels, Seaweed, Marine plants, Marine algae, Water analysis, Marine animals, *Bioindicators, Pollutant identification.
Identifiers: N-C16 Ratio, Paraffin hydrocarbon, Tissue analysis, Fucus, N-paraffin hydrocarbons.

Marine organisms can be used as indicators of petroleum pollution when it is possible to separate the biogenic paraffin hydrocarbons from pollution hydrocarbons. Once these paraffin hydrocarbon methods suggest petroleum contamination of a marine population, then other methods can be applied to delineate aromatic hydrocarbons and to establish the extent of the pollution in the marine environment. (See also W76-10370) (Katz)

INTERLABORATORY QUALITY CONTROL STUDY NO. 5, CHROMIUM, IRON, MOLYBDENUM AND VANADIUM,
Canada Centre for Inland Waters, Burlington (Ontario).
R. W. Wales, and D. J. McGirr.
Canada Centre for Inland Waters, Report Series No. 26, 1973, 6 p, 5 ref, 6 tab.

Descriptors: *Chromium, *Iron, *Molybdenum, *Heavy metals, Water quality, Absorption, Trace elements, Solvent extractions, Chemical analysis, *Pollutant identification, Analytical techniques, Water analysis.
Identifiers: *Vanadium, Atomic absorption.

Samples containing known amounts of chromium, iron, molybdenum and vanadium were distributed to thirteen laboratories to be analyzed by the laboratories' usual methods. The majority of laboratories determined the metals by atomic absorption; in addition, iron was determined colorimetrically for comparison. Only a few participants were able to analyze all four metals, and in the case of molybdenum and vanadium the small number of results received made it difficult to come to firm conclusions about the reliability of the method. The precision for chromium was better than in a previous study. The results obtained for iron by atomic absorption with solvent extraction were good, while the colorimetric method was intermediate in precision and sensitivity between solvent extraction and direct aspiration using atomic absorption. (Environment Canada)
W76-10493

INTERLABORATORY QUALITY CONTROL STUDY NO. 4, ARSENIC, CADMIUM, COBALT, MERCURY AND NICKEL,
Canada Centre for Inland Waters, Burlington (Ontario).

D. J. McGirr, and R. W. Wales.
Canada Centre for Inland Waters, Report Series No. 25, 1973, 7 p., 7 ref., 6 tab.

Descriptors: *Trace metals, *Cadmium, *Cobalt, *Nickel, Water quality, *Mercury, *Chemical analysis, Industrial wastes, Toxins, *Pollutant identification, Water analysis, Analytical techniques, Arsenic compounds.
Identifiers: Atomic absorption, *Arsenic, Stock solutions, Inorganic mercury, Orgnic mercury.

Synthetic samples containing arsenic, cadmium, cobalt, nickel and mercury were analyzed by nine laboratories participating in a study of trace metals. Most laboratories used atomic absorption methods for determining cadmium, cobalt ad nickel; precision and accuracy were good for these three metals. Results were also acceptable for arsenic, which most laboratories determined by the silver diethyldithiocarbamate method. Both precision and accuracy were rather poor for mercury, which was analyzed by various procedures based on flameless atomic absorption; it is suggested that the laboratories review their procedures. (Environment Canada)

APPLICABILITY OF THE TECHNICON AUTOANALYZER I AND II SYSTEMS FOR SHIPBOARD ANALYSIS OF GREAT LAKES WATER SAMPLES,
Canada Centre for Inland Waters, Burlington (Ontario).
F. J. Philbert, O. Elkei, W. D. Blythe, and Y. M. Sheikh.
Water Quality Branch, Technical Bulletin No. 93, 1975, 10 p. 6 fig., 9 ref. 1 tab.

Descriptors: Ships, *Water sampling, *Water quality, Great Lakes, *Lake Ontario, *Lake Huron, Phosphates, Silica, Nitrites, Nitrogen, Nitrates, Phosphorus, Ammonia, Chlorides, Chemical analysis, Sampling, *Pollutant identification, Lakes.
Identifiers: Reactive silicas, Reagents.

Water samples from lakes Ontario and Huron were analyzed simultaneously, using the Technicon AutoAnalyzer I and II (AA1 and AA11) systems, for soluble reactive phosphate, soluble reactive silica, nitrate plus nitrite nitrogen, ammonia nitrogen, total alkalinity and chloride. The major instrumental features of the AA1 and AA11 systems are described and results are compared of sample analysis, standard deviations and percent recoveries for the methods used. Comparable analytical results were obtainable from the two systems for all of the parameters except ammonia. The results of sample analysis for ammonia by the AA1 method exceeded those obtained using the AA11 method by as much as 18%. Both systems gave satisfactory percent recoveries and the precisions compared reasonably well. (Environmental Canada)

A METHOD FOR ASSESSING FRICTION LOSSES FOR A NON-NEWTONIAN FLUID, SUCH AS SEWAGE SLUDGE, UNDER LAMINAR FLOW CONDITIONS,
Thames Water Authority, London (England) Metropolitan Public Health Div.
A. J. Selby.
The Public Health Engineer, Vol. 4, No. 2, p 44-48, March, 1976. 13 fig, 2 ref.

Descriptors: Hydraulics, *Flow rates, *Sewage sludge, *Mathematical models, *Friction, *Laminar flow, *Path of pollutants, Waste water treatment, Sludge treatment.

Sewage sludge behaves more like a Non-Newtonian fluid in which shear stress is some function of shear rate, than like a Newtonian fluid. The Generalized Bingham Plastic Equation, which considers the laminar region of Non-Newtonian flow, is used to construct a universal system. This system produces a continuous curve relating friction gradient to flow velocity. It is applied using straight-forward graphical means. To use the method, the relationship between shear stress and shear rate must be determined, requiring rheological testing of the sludge. The density of the sludge must also be determined. PREDICTING THE WATER POLLUTION POTENTIAL OF PROPOSED SANITARY LANDFILLS PART I: SANITARY LANDFILL LEACHATE...WHAT IT IS,
Indiana Univ., Indianapolis. School of Medicine.
W. A. Oleckno.
Journal of Environmental Health, Vol. 38, No. 5, p 331-333, March-April, 1976. 5 tab, 12 ref.

Descriptors: *Landfills, *Groundwater, *Water pollution sources, *Leachate, Anaerobic conditions, Hydrology, Forecasting, Biodegradation, Leaching, *Path of pollutants.

Sanitary landfill leachate creates a water pollution threat to nearby groundwater sources and streams, although the problem can feasibly be prevented by adequate landfill location. Stabilization of a landfill includes biological decay, chemical oxidation, diffusion of gases, movement of liquids, dissolving and leaching of materials, movement of dissolved material, and uneven settlement. The biological decay is usually predominantly anaerobic, although there are zones where oxygen is available and decay is aerobic. Leachate may contain any of the decomposition products, such as organic matter, metallic cations, anions, and dissolved gases. Carbon dioxide dissolved in the leachate may increase the acidity. Initial leachate production depends on the time of emplacement and moisture content, but subsequent generation is seasonal in response to climatic conditions. Leachate has been found 80 ft below a landfill. Variables causing differences in leachate from different landfills include the amount and composition of refuse, its sorting and degree of compaction, the characteristics and amount of water in contact with it, the duration of contact with the water, and temperature. The leachate may be relatively heavily contaminated. However, the leachate always changes with migration, and natural strata can attenuate groundwater contaminated with leachate as it moves away from the fill area. (See also W76-10014) (Snyder-FIRL)
W76-10013

PREDICTING THE WATER POLLUTION POTENTIAL OF PROPOSED SANITARY LANDFILLS PART II: AN INDEX OF THE WATER POLLUTION POTENTIAL OF SANITARY LANDFILLS,
Indiana Univ., Indianapolis. School of Medicine.
W. A. Oleckno.
Journal of Environmental Health, Vol. 38, No. 5, p 334-336, March-April, 1976. 2 ref.

Descriptors: *Leachate, *Landfills, *Waste disposal, *Soil mechanics, Flooding, Environmental engineering, Sanitary engineering, Forecasting, *Path of pollutants, Water pollution sources.

Many factors must be considered in selecting a site for a sanitary landfill. Although landfills may pose serious hazards, landfills can be planned and maintained that will not harm water quality. A numerical index indicating the water pollution potential of proposed sanitary landfills was developed, with point values assigned to various gradations of the criteria. The criteria were precipitation, soil type between the landfill bottom and the maximum water table, and distance between the landfill bottom and the maximum water table. The index does not replace a detailed survey. Because leachate flows slowly through slightly permeable strata, attenuation has a greater chance to occur. Due to possible fractures where channeling might occur, shale, dolomite, and limestone were assigned the same point value as gravel. Since flooding may rapidly bring refuse cells to field capacity and produce large volumes of leachate, the flooding frequency should be once in 50 yr or less. If a site is considered satisfactory by the index, surface water over 200 ft away from it probably will not be contaminated. The index indicates that, all other factors being identical, a site over clayey silt 6 ft above the maximum water table is preferable to a site over 5 ft of fine sand over fractured sandstone with a maximum water table at 15 ft. Even fills found satisfactory should be investigated further to ensure that the data used was fully representative of the site. A site with one satisfactory portion may not be satisfactory 20 ft away, due to a shift in underlying rock or soil conditions. After the site is developed monitoring wells should be drilled and nearby streams sampled periodically to insure that water pollution by leachate is not occurring. (See also W76-10013) (Snyder-FIRL)

PHOSPHORUS DISTRIBUTION FROM SEPTIC TANK EFFLUENT IN COASTAL PLAIN SOILS,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Agronomy.
R. B. Reneau, Jr., and D. E. Pettry.
Journal of Environmental Quality, Vol. 5, No. 1, p 34-39, January-March, 1976. 5 tab, 25 ref.

Descriptors: *Septic tanks, *Phosphorus, *Monitoring, *Water pollution sources, Groundwater, Soil analysis, Soil water movement, Effluents, *Path of pollutants, Pollutant identification.

Phosphorus accumulations in Goldsboro and Varina sandy loams, both of whose water tables are high perched, were monitored to study the fate of phosphorus from septic effluent. Lateral and vertical phosphorus movements were determined with piezometers at selected depths and distances from the drainfield. Orthophosphate in the perched water tables decreased from 5.5 micrograms/ml in undiluted effluent to 0.32 micrograms/ml in Varina soil at 3.0 m distance and from 11.8 micrograms/ml to less than 0.20 micrograms/ml in Goldsboro soil at 3.0 m distance. Little orthophosphate was present in either soil at 12 m distance. The possibility of vertical movement contaminating permanent groundwater tables is limited, because the slowly permeable horizons were effective barriers to vertical orthophosphate movement. Phosphorus was concentrated at depths from 142 to 152 cm in the Goldsboro loam. The septic effluent did not appreciably alter fixed phosphorus quantities of phosphorus fraction distributions in the Goldsboro loam or farther than 3 m from the system in the Varina soil. Soil phosphorus fractions near the drainfield were present mainly as ammonium fluoride and sodium hydroxide extractable phosphorus and organic phosphorus. In the Varina loam, the ammonium fluoride extractable phosphorus fraction increased from 2 to 4 micrograms/g in the control profile to as much as 460 micrograms/g, and the sodium hydroxide extractable phosphorus fraction from between 40 and 50 micrograms/g to as high as 425 micrograms/g, at 0.15 m in the argillic horizons. POLLUTION OF GROUNDWATER BY LANDFILLS (POLLUTION DE L'EAU SOUTERRAINE PAR LES DECHARGES),
G. Matthess.

Techniques et Sciences Municipales--L'Eau, No. 2, p 67-75, 1976, 18 ref.

Descriptors: *Groundwater, *Landfills, *Water pollution control, Hydrological aspects, Flow rates, Water pollution sources, Waste disposal.

The possibilities for minimizing hazards of groundwater pollution, as related to choice of landfill site, are discussed. Some hydrogeological conditions are mentioned in which local groundwater pollution can be tolerated to avoid other environmental hazards. In hydrogeological conditions unfavorable to landfill siting, such as karst, heavily fractured rock, and aquifers, where the porosity allows for a high flow rate, landfills should be authorized only where widespread pollution of groundwater is prevented. A SIMULATION OF WATER POLLUTION MODEL PARAMETER ESTIMATION,
National Aeronautics and Space Administration, Langley Station, Va. Langley Research Center.
J. F. Kibler.
In: Proceedings of the 22nd Annual Technical Meeting of the Institute of Environmental Sciences, April 26-28, 1976, Philadelphia, Pennsylvania, p 533-537. 5 ref.

Descriptors: *Pollutant identification, *Path of pollutants, *Model studies, Water pollution, Mathematical models, Computer models, *Simulation analysis.
Identifiers: *Pollution transport models.

The parameter estimation procedure for a water pollution transport model was developed using simulated data. A two-dimensional instantaneous-release, shear-diffusion model was selected to represent a simple transport process. It was used with a remote sensor model which connected it with an inertial coordinate system. Data from a remote sensor was simulated by values generated by the transport model, with gaussian noise added. A least -squares batch processor used this data to estimate model parameters, providing a means to evaluate sensor characteristics. The most accurate estimates for all parameters could be produced by variable resolution, but variable resolution would increase sensor or data acquisition costs. Data acquisition strategy distinctly affects estimate accuracy. Imaging strategy can be specially designed for accurate estimates of one or two parameters of interest. All parameters can be estimated accurately by multiple data passes. Data acquisition costs can be reduced by using a limited number of carefully placed images, which can yield nearly the accuracy of many more data points. (Snyder-FIRL)

COMPUTER-AIDED MODELLING OF STREAM PURIFICATION CAPACITY, PART I: NON-LINEAR DO MODEL,
Rensselaer Polytechnic Inst., Troy, N. Y.
L. K. Wang, D. Vielkind, and M. H. Wang.
In: Proceedings of the 22nd Annual Technical Meeting of the Institute of Environmental Sciences, April 26-28, 1976, Philadelphia, Pennsylvania, p 553-557. 2 fig, 2 tab, 15 ref.

Descriptors: *Waste assimilative capacity, *Dissolved oxygen, *Self-purification, Rivers, *Waste water disposal, Biodegradation, Model studies, Mathematical models, Reaeration, Streams, Biochemical oxygen demand, *Path of pollutants, *Computer models.

When non-toxic, biodegradable plant effluent with low nutrient content is released into a stream, the dissolved oxygen (DO) content initially decreases due to the high biochemical oxygen demand (BOD), then increases as the atmospheric aeration rate becomes greater than the BOD, until the normal cycle is reestablished. This process is known as self-purification. Oxygen is needed for the reactions which convert organic substances to carbon dioxide, water, phosphate, sulfate, nitrite, and nitrate. For this reason, a stream is capable of self-purification only if its water contains sufficient DO and necessary microorganisms. The minimum DO concentration is different in different types of streams. Equations exist for calculating the time until the minimum DO content is reached, the DO deficit at that point, the distance to the location where the minimum occurs, and the initial DO deficit. The DO saturation concentration must be known in order to calculate this last quantity. The DO concentration at the critical location must be at least the minimum DO concentration established by governmental standards. A new mathematical model was developed for the DO saturation concentration. A computer was used to compare data with linear, quadradic, and cubic functions of temperature. A cubic function produced the best fit. It was accurate to plus or minus 0.01 mg/liter DO, while a previous model was only accurate to plus or minus 0.1 mg/liter. Results from the model can be used, in turn, to determine DO deficits, the critical DO concentration, and the DO drop that can be allowed in a stream receiving waste water. (See also W76-10025) (Snyder-FIRL)
W76-10024

COMPUTER-AIDED MODELLING OF STREAM PURIFICATION CAPACITY, PART II: MULTIPLE LINEAR CORRELATION METHOD,
Rensselaer Polytechnic Inst., Troy, N. Y.
L. K. Wang, M. H. Wang, and D. Vielkind.
In: Proceedings of the 22nd Annual Technical Meeting of the Institute of Environmental Sciences, April 26-28, 1976, Philadelphia, Pennsylvania, p 558-564. 1 fig, 2 tab, 9 Ref.

Descriptors: *Waste assimilative capacity, *Dissolved oxygen, *Self-purification, Streams, Rivers, Reaeration, Waste water disposal, Biodegradation, Model studies, Mathematical models, Biochemical oxygen demand, *Path of pollutants, *Computer models, *Correlation analysis.

A FORTRAN computer program can derive two mathematical models for the mechanism of dissolved oxygen exchange by natural waters. The quantities modeled are dissolved oxygen (DO) drop and biochemical oxygen demand (BOD) at the DO sag in a stream. The multiple linear correlation method was previously used to model these quantities. A generally good correlation was demonstrated between DO, BOD, stream water temperature, and stream flow. A computer must be used, however, to develop these models for a specific stream. As an example, these models were developed for a stream which had been studied previously without the computer program. A plant discharged effluent into a small creek which then flowed into the main stream. Data were collected on four days with varying flow conditions. Sampling was performed on the creek both upstream and downstream of the discharge and on the main stream above, at, and below the confluence with the small creek. Data on upstream BOD, stream water temperature, stream flow, and BOD at the stream's sag point were used to obtain the specific models for DO drop and BOD. The observed DO drop at the sag point was predicted very precisely by the specific model. The BOD model showed acceptable accuracy in predicting the loads observed at the sag point. (See also W76-10024) (Snyder-FIRL)

INDUSTRIAL RESEARCH INSTITUTE STUDYING POLLUTION PROBLEMS OF SETO INLAND SEA,
Chugoku National Industrial Research Inst., Hiroshima (Japan).
T. Fukuda, and N. Hayakawa.
Civil Engineering in Japan, Vol. 14, p 143-149, 1975. 3 fig.

Descriptors: *Water quality, *Model studies, *Water pollution effects, *Mathematical models, Rivers, Photography, Water pollution control, *Computer models.
Identifiers: *Japan(Inland Sea).

A scale model was built of the Inland Sea, a shallow, narrow body of water surrounded by three major Japanese islands, to study methods of reducing further water quality deterioration. Its scale ratio is one to 2,000 in the horizontal and one to 160 in the vertical. Tides are reproduced with recirculating pumps and oscillating weirs and measured by up to 40 gauges. A computer is available to aid in the simulation and record the measurements. Over 70 rivers discharging regulated flow of dye solution are included in the model. Water samples can be extracted from any part of the model without disturbing the flow. An ultrasonic current meter measures flow velocity. Cameras are mounted above the model, and can be used to photograph floats. A study of dissolved oil diffusion with this model accurately predicted the results of an incident in which an oil refinery tank burst. Tidal flow in the inland sea is being measured for verification of the model. A more generalized density current basin and an alternating flow channel are used for more fundamental study. Mathematical computer models of tidal flow and diffusion in the Inland Sea are also being developed. (Snyder-FIRL)

INTERPRETATION OF INTERNAL TRACER EXPERIMENTS AND LOCAL SOJOURN TIME DISTRIBUTIONS,
City Coll., New York. Dept. of Chemical Engineering.
Y. Zvirin, and R. Shinnar.
International Journal of Multiphase Flow, Vol. 2, No. 5 and 6, p 495-520, April, 1976. 11 fig, 2 tab, 29 ref.

Descriptors: *Tracers, *Flow system, *Flow characteristics, Analytical techniques, Tracking techniques, Measurement, Water pollution, Hydrology, Hydrologic properties, Dispersion, Flow, Mixing, Path of pollutants.
Identifiers: Transport processes, Peclet number.

A general approach for the interpretation of tracer experiments designed to study transport processes in flow systems with multiple inlets and outlets is described. A method for the description of these processes is suggested based on the definition of such local model-free parameters as the purging rate, mixing rate, equivalent Peclet number and local sojurn time distributions. These parameters can be determined directly from tracer measurements without resorting to any model. Their values and especially their spatial distributions in the system describe the nature of the mixing and purging (or flushing) processes in the system. Experiments are described in which tracer material is introduced at given points within the system followed by measurements of the resulting concentration histories at the same points as well as at different sites. The results are pertinent to a variety of areas in which tracer experiments are used, including water physiology, hydrology, and the study of dispersion processes in the oceans. (Kreager-FIRL)

S.
Identifiers: Future water requirements, Groundwater evaluation.

Ground-water contamination problems have been investigated in six, northwest states: Colorado, Idaho, Montana, Oregon, Washington and Wyoming. Ground water represents 12 percent of the total water utilized in the region. Industrial and agricultural growth and development of new energy sources will cause a sharp increase in groundwater use over the next 30 years. Groundwater quality varies widely throughout the region. The most common problems are salinity, excessive hardness, iron, manganese and flouride. The principle sources of man-caused ground-water quality problems are: Septic tank sewage treatment plant discharges, irrigation return flow, dryland farming, abandoned oil wells, shallow disposal wells, unlined surface impoundments, mine tailings and drainage, municipal and industrial landfills, and radioactive waste disposal. The findings of the investigation were that with the exception of radioactive waste disposal, few cases of groundwater pollution have been examined in detail. A need exists for baseline water-quality data and systematic eavaluation of overall ground-water conditions; especially in urban zones, areas of petroleum exploration and development, and at locations of mining and industrial activity. Identifiers: *Fort Myers(Fla).

Recognizing the potential problem of contamination of groundwater supplies by a landfill operated by Fort Myers, Fla., city officials requested that an investigation be made by the U. S. Geological Survey. Chemical analyses of water from 11 wells were adequate to show definite effects on groundwater quality in the vicinity of the landfill site. These effects were observed as far as 1,200 ft down gradient. When compared to the average concentrations of chemical constituents determined in comparable wells used as controls, water from the well with the greatest effect had sulfate 72 times greater, potassium 43 times greater, ammonia nitrogen 20 times greater, sodium and chloride 12 times greater, and most other chemical constituents 2 to 8 times greater. The results are expected to be of considerable value in the future selection of landfill sites, as well as to provide information on problems associated with existing sites which may be useful in determining more effective methods of operation. MODELS FOR EVALUATION OF HAZARDOUS WASTES,
Municipal Environmental Research Lab., Cincinnati, Ohio.
A. J. Klee.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. EE1, p 111-125, February 1976. 8 tab, 15 equ, 14 ref.

Descriptors: *Wastes, *Streams, *Environmental engineering, *Decision making, Materials, Hazards, Water pollution sources, Model studies, Equations, Systems analysis, Path of pollutants.
Identifiers: *Utility theory, Rating models, *Hazardous wastes, *Hazardous materials.

The problems encountered in the development of models for the quantification of the degree of hazard to the environment of waste streams are examined. With the aid of a numerical example, an additive utility approach is elucidated in detail. Three recently proposed hazardous waste rating models are also critically reviewed. In general, the complexities involved and the assumptions implied in the selection and implementation of such models are not recognized. Further, when applied to a sample of hazardous materials, there is inadequate agreement among these rating models. (Bell-Cornell)

Descriptors: *Water quality, *Estuaries, *Mathematical models, *Environmental engineering, Algorithms, Management, Numerical analysis, Phosphorus, Optimization, Data collections, Computers, Equations, Systems analysis, *Texas, Path of pollutants.
Identifiers: *Matrices(Mathematics), Transport process, Steady-state model, Linear matrix equation, Linear algebraic constraints, *Corpus Christi Bay(Tex).

A new mathematical modeling approach for predicting the concentrations of water quality constituents in an estuary has been developed. The model foundation is a two-dimensional partial differential equation describing the transport process in the estuary. The discretized version of a steady-state model is reformulated as a large dimensional linear matrix equation whose solution is obtained by an efficient iterative procedure. An analytical criterion for calibration is considered and the agreement of the matrix model solution with field data is examined. The model is calibrated with data for total phosphorus collected in two periods in the fall of 1972 from 18 sampling stations in Corpus Christi Bay. Numerical analysis of the matrix model is presented and its performance is compared with another phosphorus model for the Corpus Christi Bay system. This approach provides a simple structure for the model that is ideally suited to water quality management analysis and cost optimization. (Bell-Cornell)

THE FATE OF POLLUTANTS IN SUBSURFACE ENVIRONMENTS,
Weston (Roy F.), Inc., West Chester, Pa.
A. A. Metry.
In: Proceedings, 22nd Annual Technical Meeting of the Institute of Environmental Sciences, April, 1976, Philadelphia, Pennsylvania, p 1-5. 8 fig.

Descriptors: *Subsurface waters, *Aquifers, *Aquifer management, *Mathematical models, *Groundwater, *Waste disposal, Hydrogeology, Hydrologic data, Computer programs, Model studies, Mathematical models.
Identifiers: Land application.

Degradation of subsurface water quality is widespread. Examples of the pollution of groundwater due to improper land disposal are cited. Subsurface water can also be polluted by waste water seepage, deep well injection, and leachates from hazardous solid wastes. The threat to subsurface water in a given area is indicated by its hydrogeologic parameters, which should be important in planning storage and disposal sites. Mathematical models are developed to predict the migration and fate of leachate and pollutants in subsurface environments. A one-dimensional mathematical model was developed for attenuation of pollutants in subsaturated soils. Several mathematical models are developed for the migration of pollutants from a disposal site into aquifers; all include molecular diffusion, convective dispersion, and chemical reaction. A computer program simulating pollutant fate in aquifers was developed, incorporating the output of the subsaturated soils model and predicting concentrations of pollutants at various points in the aquifer. The models are flexible and practical, and account for the major mass transport mechanisms. They can be used in disposal site selection, evaluation of environmental impact, and recovery of groundwater contaminants. Their accuracy depends on that of the hydrogeologic parameters used in the simulation. (Snyder-FIRL)

MICROBIOLOGY AND CHEMISTRY STUDIES OF WATER QUALITY FACTORS IN A WATERSHED USED FOR MUNICIPAL SUPPLY AND WASTE DISPOSAL,
Montana State Univ., Bozeman. Dept. of Botany and Microbiology.
J. Schillinger, and D. Stuart.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-255 185, $6.00 in paper copy, $2.25 in microfiche. Research Report No. 74, Montana University Joint Water Resources Research Center, Bozeman, March 1976. 124 p, 71 fig, 5 tab, 47 ref. OWRT B-040-MONT(3).

Descriptors: *Water quality, *Land use, *Microbiology, *Chemistry, Water supply, Watersheds(Basins), Waste disposal, *Montana, Municipal water, Clear cutting, Grazing, Bioindicators.
Identifiers: East Gallatin River(Mont), Non-point pollution.

Chemical and bacteriological studies were performed to determine relative impacts of several land uses on water quality. Outdoor recreation, camping, and a winter ski development demonstrated no measurable adverse affect on quality. Clearcut logging with the use of streamside buffer zones resulted in little change in stream quality in the South Fork of Bozeman Creek. Wild animals appeared to cause bacterial contamination in the Bozeman Creek municipal watershed. Cattle grazing also resulted in some bacteriological stream quality degradation in several tributaries of the Hyalite drainage. Further research is required to assess adequately the public health significance of the bacterial levels observed. Agricultural runoff caused increased levels of chemical nutrient and indicator bacteria in the lower reaches of Bridger Creek, Hyalite Creek, and in the East Gallatin River. It appears that better streamside land-use practices could alleviate these adverse water quality impacts. (Holje-Montana State)

BORON AND ARSENIC STUDIES IN FLORIDA WATERS,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
N. E. Carriker, W. T. Gillespie, and P. L. Brezonik.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-255 182, $5.50 in paper copy, $2.25 in microfiche. Florida Water Resources Research Center, Gainesville, Publication No. 34, May 1976. 100 p, 35 fig, 22 tab, 89 ref. OWRT A-024-FLA(1). 14-31-0001-5009.

Descriptors: *Arsenic, *Boron, *Toxicants, *Pollution sources, Water pollution, *Florida, Nutrients, Detergents, Toxicity, Phytotoxicity, Lakes, Sediments.
Identifiers: Lake Apopka(Fla).

Levels of arsenic and boron in Florida natural waters have been measured and found generally to be low and not of toxic concern. Boron levels in municipal sewage effluent are high enough to cause phytotoxicity, at least to sensitive plant such as citrus. The source of the elevated boron levels in sewage evidently is detergent use of borates as softeners and perborates as bleaching agents. Analysis of boron in rainfall found increasing concentrations near the coasts, indicating marine-derived aerosols are an important source of boron in the natural cycle of boron in Florida. Boron is a relatively conservative substance and model ecosystem studies indicate little toxic hazard and little bioaccumulation at the boron levels expected in natural waters. Arsenic levels in Florida surface and ground waters were found to be normally quite low (a few ppb) to undetectable (less than 1 ppb). Canals in South Florida around Lake Okeechobee had higher levels than other parts of the state, with detectable levels in almost all samples and a mean of 5 ppb. The arsenic cycle in aquatic systems appears to be sediment dominated. In citrus grove soils arsenic was associated mainly with the iron fraction, but in anaerobic Lake Apopka sediments, arsenic was present primarily in a leachable 'water soluble' form and was present as As III. Catfish from Lake Apopka do not appear to concentrate arsenic, but waterhyacinths from Lake Apopka had about 1 ppm (dry wt). (Morgan-Florida)

A PRELIMINARY COMPARTMENT MODEL OF THE NITROGEN CYCLE IN A DECIDUOUS FOREST ECOSYSTEM,
Idaho Univ., Moscow. College of Forestry, Wildlife and Range Sciences.
J. E. Mitchell, J. B. Waide, and R. L. Todd.
In: Proceedings of a symposium 'Mineral Cycling in SOutheastern Ecosystems,' 1975, p 41-57. 2 fig, 5 tab, 40 ref, (CONF-740513).

Descriptors: *Ecosystems, *Cycling nutrients, *Nitrogen cycle, *Deciduous forests, Model studies, Forest soils, Organic matter, Vegetation, Litter, Bacteria, Fungi, Root zones, Temperate, North Carolina.
Identifiers: Nitrogen conservation, Franklin(NC), Coweeta Watershed(NC).

A 15-compartment model of nitrogen storage and transfer in a mature hardwood forest at the Coweeta Hydrologic Laboratory, near Franklin, North Carolina, is described and discussed. Most of the nitrogen in this ecosystem is located in large storage compartments that turn over slowly. Over 80% of the total nitrogen is in soil organic matter, with about 11% in vegetation, 3% in litter, 4% in microbes, and 2% in free soil pools. Uptake of

nitrogen is estimated to be 141.6 kg/ha/yr, of which about 10% is retained within the vegetation. A quantitatively large pool of nitrogen is shown to recycle annually within plants, a strategy which contributes to nitrogen conservation. Calculations suggest that litter inputs to soil organic pools are dominated by belowground material, especially small roots and mycorrhizae. In the soil available nitrogen seems to be rapidly immobilized by soil biota or taken up by the root-mycorrhizae complex, with very little nitrogen being lost from the system in stream water or denitrification. The study illustrates a dynamic cycle in which nitrogen is efficiently retained and recycled within the ecosystem. The gap in information on the root zone processes is stressed. SIMULATION OF NITROGEN DISTRIBUTION AND ITS EFFECT ON PRODUCTIVITY IN EVEN-AGED LOBLOLLY PINE PLANTATIONS,
Agricultural Univ., Wageningen (Netherlands). Dept. of Theoretical Production Ecology.
Penning F. W. T. De Vries, C. E. Murphy, C. G. Wells, and J. R. Jorgensen.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, p 70-83. 6 fig, 1 tab, 15 ref, (CONF-740513). NSF AG-199, BMS 69-01147-A09.

Descriptors: *Nitrogen cycle, *Loblolly pine trees, *Model studies, Coniferous trees, Forest management, Nutrient requirements, Productivity, North Carolina, Computer programs, Southeast US, Nitrogen, Distribution.
Identifiers: Pine plantations.

A model describes growth in even-aged loblolly pine plantations from seedling to mature trees on sites where nitrogen availability is limiting, where the number of trees and shrubs in the understory is kept low, and managed with a 25- or 40-year rotation. The rate of decomposition and nitrogen release of the forest floor is simulated by treating 20-year classes of litter by the amount of biomass and nitrogen. Decomposition rates are calculated from the ratio of total carbon and nitrogen per layer, rather than treating needles and branches separately, and exclude the effects of temperature and humidity on decomposition. Trees were subdivided into roots, stem wood, stem bark, branches, and first- and second-year needles, with total dry weight and nitrogen content simulated for each of these fractions. The limiting effect of nitrogen is on assimilation on an annual basis rather than on growth. The model describes the physiological, microbiological, and mechanical processes relevant to nitrogen distribution and forest growth by a computer program in Continuous Simulations Modeling Program language. The program integrates the rates of change over one year and reports resulting amounts of nitrogen and biomass in the various parts of the system. Sudden modifications of distribution caused by cultural practices are taken into account. (See also W76-10266) (Auen-Wisconsin)

FREQUENCY DISTRIBUTIONS OF RADIOCESIUM CONCENTRATIONS IN SOIL AND BIOTA,
Savannah River Ecology Lab., Aiken, S.C.
J. E. Pinder, and M. H. Smith.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, p 107-126. 2 fig, 1 tab, 44 ref, 2 append, (CONF-740513). AEC AT (38-1)-310, AT(38-1)-708, AT(38-1)-819.

Descriptors: *Distribution patterns, *Radioisotopes, *Frequency analysis, *Mathematical models, Cesium, *Soils, *Biota, Rating curves.

Mathematical modeling to analyze and compare frequency distributions of radionuclide concentrations (primarily C-137) in various components of ecosystems at the Atomic Energy Commission's Savannah River Plant near Aiken, S.C. is discussed. The approach used was to evaluate four simple distributions--normal, log normal, exponential, and Weibull--as possible models of observed frequency distribution of radiocesium concentrations. The normal and exponential distributions showed closest agreement to relatively few sample distributions. When the Weibull model showed the closest agreement to a sample, it was usually only slightly better than one of the other models. The normal models showed the closest agreement to 7 samples, the log normal to 22 samples, and the exponential to 4 samples. The data indicate that a simple general model applicable to all the frequency distributions of radiocesium concentrations may not exist. The frequent rejection of the hypothesis--cumulative distribution function $F(x)=S(x)$ (sample cumulative distribution)--for all models, the occurrence of at least some large values of distribution for each model, and the reduction in skewness and kurtosis from producers to consumers indicate that the distributions are too complex and varied to be accurately modeled by any one of the four distributions considered. FACTOR ANALYSIS: AN EXPLORATORY TECHNIQUE APPLIED TO MINERAL CYCLING,
Georgia Univ., Athens. Inst. of Ecology.
J. B. Nabholz, and T. H. Richardson.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, p 126-141. 1 fig, 4 tab, 43 ref, 2 append, (CONF-740513).

Descriptors: *Statistical methods, *Correlation analysis, *Ecosystems, APproximation method, Probability, Computer programs.
Identifiers: *Factor analysis.

Factor analysis is a multivariate statistical method that constructs artificial (unobservable) variables to explain the dependence structure found in a correlation matrix. These artificial variables are called common factors. A vector of correlations is generated between the observable attributes and such common factors. These attributes, highly correlated with a common factor, form a group the members of which share some common property over and beyond that which they share with other observed attributes. The exploratory approach is used to gain a better understanding of complex and poorly defined interrelationships among a large set of imprecisely measured attributes. Factor analysis consists of two separate procedures--factor extraction followed by factor rotation. The analysis is always started from a correlation matrix computed from a sample variance-covariance matrix or a multiple thereof, e.g., the matrix of sums of squares and products for error. Factor analysis, its definition, and historical roots are discussed. This statistical technique is contrasted with pseudo factor analysis, i.e., principal-components analysis. Factor extraction and factor rotation, as they apply in factor analysis, are clarified and interpreted. Advantages and disadvantages of the statistical method are enumerated. Applications of factor analysis in mineral-cycling studies and their usefulness in ecology are presented. (See also W76-10266) (Auen-Wisconsin)

THE ROLE OF PHYSICAL MODELING IN MARSH-ESTUARINE MINERAL-CYCLING RESEARCH,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Environmental Effects Lab.
R. L. Eley, J. W. Falco, and C. J. Kirby.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems' 1975, (CONF-740513), p. 166-178, 2 fig, 1 tab, 30 ref.

Descriptors: *Model studies, *Cycling nutrients, *Tidal marshes, *Estuaries, Ecosystems, Environmental effects, Hydrologic aspects, Design criteria, Louisiana, Hydraulic models, Heavy metals.
Identifiers: Physical models, Mineral cycling, Barataria Bay(La).

Physical modeling of marsh-estuarine ecosystems as a supplement to traditional field, laboratory, and mathematical modeling research is discussed, together with their functions in designing and interpreting field studies and in developing and verifying mathematical models. Physical hydraulic models constructed for engineering purpose--navigation and coastal construction projects--can provide significant assistance in mineral-cycling research. The design of a simulator of Barataria Bay, Louisiana, suitable for studying mineral cycling between a shallow estuary and the surrounding tidal marsh ecosystem, is described. The simulator was formulated for use in treatment-control experiments to study differences between nutrient and heavy-metal cycling in natural marsh-estuarine ecosystems and those in ecosystems artificially created with dredged material. The model included representative fauna and flora of the Barataria Bay, consisting of no less than 8 genera of algae and 30 genera of animals representing major phyla from Protozoa to Chordata; these included snails, crabs, shrimp, small fin fishes, and marshgrass insects. The marsh was dominated by Spartina alterniflora with some Distichlis specata. (See also W76-10266) (Auen-Wisconsin)

CONCENTRATIONS OF TOTAL MERCURY AND METHYL MERCURY IN FISH AND OTHER COASTAL ORGANISMS: IMPLICATIONS TO MERCURY CYCLING,
Skidaway Inst. of Oceanography, Savannah, Ga.
W. S. Gardner, H. L. Windom, J. A. Stephens, F. E. Taylor, and R. R. Stickney.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975 (CONF-740513), p. 268-278. 1 fig., 1 tab., 17 ref. NSF GX-33615.

Descriptors: *Mercury, *Fish, *Rooted aquatic plants, *Crustaceans, *Estuaries, South Carolina, Georgia, Florida, Food chains.
Identifiers: *Methyl mercury, Spartina alterniflora, Osteichthyes, Chondrichthyes.

Total and methyl mercury concentrations were determined in a variety of fish, crustaceans, and Spartina alterniflora in estuaries along the coasts of South Carolina, Georgia, and Florida. Higher levels of mercury were found in fish tissues. Because of its relative stability in biological

systems and its unique biochemical characteristics, methyl mercury apparently is metabolized differently than is inorganic mercury, which may explain the greater mercury accumulation in fish. This difference would be expected if the fish were exposed to methyl mercury as it is accumulated in the muscles. Molluscan studies have shown that mercury administered in different forms is excreted at different rates, but methyl mercury was retained much longer than either inorganic mercury and phenyl mercury. The concentration of total mercury relative to methyl mercury in livers and spleens may be indicative of the quantity of inorganic mercury or nonmethyl organic forms to which the fish have been exposed over short periods of time, whereas mercury in muscle tissue represents accumulation of methyl mercury over longer periods. Methyl mercury potentially can be transported upward through Spartina plants thus if the mercury is released to the water column, it could be taken up by fish, which could explain the higher mercury levels in finfish than in the intermediate food-chain members. MINERAL PATHWAYS IN SMALL APPALACHIAN STREAMS,
Georgia Power Co., Atlanta. Environmental Div.
W. R. Woodall, and J. B. Wallace.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 408-422. 1 fig., 5 tab., 39 ref. NSF AG-199, 40-193-69; FWQA 18050DPQ.

Descriptors: *Cycling nutrients, *Streams, *Energy budget, *Benthic fauna, Appalachian Mountain Regions, Detritus, Standing crops, Leaves, Litter, Crayfish, Salamanders, Potassium, Calcium, Magnesium, Food webs, Leaching, Animal metabolism, North Carolina, *Path of pollutants.
Identifiers: Coweeta Hydrologic Laboratory(NC).

The effects of the metabolism of benthic fauna on the flux of potassium, calcium and magnesium were studied in streams of the Coweeta Hydrologic Laboratory draining southern North Carolina watersheds covered with different vegetation types. Most detritivore and predator standing-crop biomass consisted of crayfish and salamanders, respectively, and accounted for most flux in those food web compartments; they may be important in small stream nutrient flows because they form a sink in the remineralization process. Potassium increases and calcium and magnesium decreases were associated with increased trophic levels. Because food materials were richer in calcium and magnesium than potassium, detritivores concentrated proportionately more potassium. Potassium was principally released from detritus by leaching and calcium and magnesium were released by detritivores feeding on leaves. Cation standing crops in detritus from hardwood and coppice streams were larger than in pine and old-field detritus. Detritus contained more calcium than potassium and magnesium. Coweeta streams are small, so detritus may be more important than in larger streams. Nutrient removal from watersheds by streams is enhanced by invertebrate breakdown of leaf material. The agreement between ingestion and available food explains why there is no long-term detritus accumulation in streams. Because some organisms eat detritus egested by others, available detrital food can be increased 2.5 times. (see also W76-10266) (Buchanan-Davidson--Wisconsin).

ORGANICALLY COMPLEXED COPPER, ZINC, AND CHELATING AGENTS IN RIVERS OF WESTERN PUERTO RICO,
Puerto Rico Nuclear Center, Mayaguez.
J. R. Montgomery, and J. E. Echevarria.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 423-434. 1 fig., 3 tab., 29 ref. AEC AT(40-1)-1833.

Descriptors: *Copper, *Zinc, *Chelation, *Rivers, *Puerto Rico, Trace elements, Metals, Organic matter, Water pollution effects, Organic loading, Calcium, Tropical regions, Suspended solids.
Identifiers: *Organic chelators, Guanajibo River(PR), Anasco River(PR), Culebrinas River(PR).

During a study of a trace-metal transport from terrestrial to marine environments at the Puerto Rico Nuclear Center, a method for determination of soluble chelators was used which gave their concentration in copper-equivalent chelating capacity units in fresh or slightly brackish water. Soluble chelators were determined in three Puerto Rican rivers. High values were found in a shallow clear river and below San German which discharges municipal sewage into the Guanajibo River in February when there was also an increased organic load from a sugar mill, decreased rainfall, and increased mean organic matter concentration due to low runoff. There were enough chelating agents in the river water to complex all soluble copper and zinc ions present, but only about 44% of the copper and 75% of the zinc ions were organically complexed. The high calcium ion to copper ion ratio probably prevented formation of more organically complexed copper. Chelator concentrations in tropical rivers seemed higher than in Canadian lakes. Soluble chelator concentrations were directly related to organic material input from municipalities and a sugar mill and inversely related to river particulate matter increases during the rainy season. No significant correlation was found between particulate organic carbon, dissolved reactive phosphate, and chelator concentrations. (See also W76-10266) (Buchanan-Davidson--Wisconsin).
W76-10292

REDISTRIBUTION OF CESIUM-137 IN SOUTHEASTERN WATERSHEDS,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
J. R. McHenry, and J. C. Ritchie.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 452-461. 1 fig., 3 tab., 13 ref. AEC AT(49-7)-3029.

Descriptors: *Distribution, *Cesium, *Radioisotopes, *Watersheds(Basins), *Southeast U. S., Radioactive fallout, Sediments, Soil erosion, Erosion rates, Reservoirs, Cultivated lands, Crops, Georgia, Kentucky, Maryland, Mississippi, North Carolina, West Virginia.

Movement of radioactive materials in watershed ecosystems must be understood so that decisions on locating nuclear reactors and the release of radioactive materials from reactors can be made to ensure safety and sustain the ecosystems. Cesium-137 fallout from nuclear bomb tests in the 1950s and 1960s was studied in soil surface samples of 14 southeastern watersheds and agricultural reservoir sediments. Cesium-137 levels reflected the nature of the watershed, its cover, and land use. Since cesium-137 distribution results from soil erosion, recent erosion rates were calculated from cesium-137 accumulations in sediments and from decreases in cesium-137 calculated to have been deposited on upland soils. In the watersheds studied, most cesium-137 fallout remained in the watershed. Some moved from the watershed as shown by an areal cesium-137 buildup in sediments of reservoirs controlling watershed outflows. Cesium-137 loss was greater from cultivated than uncultivated watersheds. A considerable amount of the cesium-137 deposited on cultivated areas is removed with crops. If an agricultural watershed was greatly contaminated, little radioactive loss would be expected if crops were not removed. If fine particles entering reservoirs with runoff were flocculated, radioactivity losses through the reservoirs would be reduced. The Cs-137 loss is very small (5%) from uncultivated watersheds. (See also W76-10266) (Buchanan-Davidson--Wisconsin).
W76-10295

RADIOCESIUM CYCLING IN VEGETATION AND SOIL,
Oak Ridge National Lab., Tenn. Environmental Sciences Div.
R. C. Dahlman, C. W. Francis, and T. Tamura.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 462-481. 2 fig., 7 tab., 57 ref.

Descriptors: *Cesium, *Radioisotopes, *Vegetation, *Soils, Coastal plains, Dynamics, Nuclear reactors, Watersheds(Basins), Radioactive fallout, Clay minerals, Food chains, Root systems, Absorption, Southeast U.S., Milk, Florida, Georgia, Forage grasses.
Identifiers: Tampa(Fla).

Factors that influence the cycling of cesium in terrestrial ecosystems, especially mechanisms influencing the dynamics and fate of Cs-137 in pathways leading to man, are reviewed. Clay minerals in soil, especially micaceous types, fix cesium effectively and remove it from biotic components of ecosystems. Fallout Cs-137 enters food chains primarily by direct deposition on vegetation; uptake by roots is usually less. Soil serves as an effective sink for Cs-137, thus minimizing uptake by roots. Movement from soil to plants is dependent on the temperature, moisture, fertility, hydrogen ion concentration, and the physical, mineral, chemical, and biological conditions of the soil. The estimated Cs-137 concentrations, based on current concepts of its dynamics in vegetation and fixation in soil, agree with values found in vegetation collected in 1969-1970. Mechanisms of direct deposition and increased root uptake due to absence of micaceous clays explain the higher levels found in vegetation in the southeastern U.S. Coastal Plain and were therefore responsible for the high Cs-137 levels found in milk from the Tampa, Florida, watershed. Mycorhizal, symbiotic enhancement of uptake may also affect levels of Cs-137 in vegetation and milk. (See also W76-10266) (Buchanan-Davidson--Wisconsin)
W76-10296

ACCUMULATION AND MOBILITY OF CESIUM IN ROOTS OF TULIP POPLAR SEEDLINGS,
Tennessee Valley Authority, Norris. Div. of Forestry, Fisheries, and Wildlife Development.
T. L. Cox.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 482-488. 2 tab., 8 ref.

Descriptors: *Cesium, *Root systems, *Radioisotopes, *Trees, Seasonal, Forest soils, Sorption, Root zone, Distribution, Path of pollutants.
Identifiers: *Tulip poplar.

Seasonal distributions in different root-diameter classes and cesium pathways to forest soils were studied in the tulip poplar, Liriodendron tulipifera, seedlings stem-well tagged with Cs-134, harvested periodically, and separated into shoot and root compartments. Roots less than 0.1 cm in diameter contained 1.5 and 3.0 times the cesium in roots 0.1-0.5 cm and 0.5-1.0 cm in diameter, respectively. Roots contained 24% of the seedling cesium pool in one week, 40% in seven weeks, and 65% eight months after tagging. Roots less than 0.5 cm in diameter contained approximately 36% the seedling pool (root and shoot) and 72% of the cesium pool after a year. Small roots accounted for a considerable portion of annual turnover in the root systems. Growth dilution, leaching, exudation, sloughing, translocation from soil and shoot parts, etc., accounted for seasonal concentration changes. Analysis of soil treatment effects showed that root processes contributed twice as much cesium to the soil as combined aboveground processes. Determination of seasonal distributions of root biomass by diameter class is important in determining the role of roots in accumulation and transfer of cesium and analagous elements, since most annual turnover by mortality occurs in roots

ess than 0.5 cm in diameter. (See also W76-10266) Buchanan-Davidsoni-Wisconsin)
V76-10297

DISTRIBUTION OF RADIOCESIUM IN VEGETATION ALONG A CONTAMINATED STREAM,
Savannah River Ecology Lab., Aiken, S.C.
L. A. Briese, C. T. Garten, and R. R. Sharitz.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 509-517. 2 fig., 1 tab., 15 ref. AT(38-1)-708, AT(38-1)-819.

Descriptors: *Cesium, *Radioisotopes, Vegetation, Streams, South Carolina, Nuclear wastes, Leaves, Streamflow, Distribution, Southeast U.S., Soil contamination, Water pollution, Willow trees, Statistical methods, Path of pollutants.
Identifiers: *Steel Creek(SC), Arrowhead, Smartweed, Woolgrass.

Radiocesium concentrations were measured in leaves of plants along Steel Creek which was contaminated by radioactive effluent from nuclear production reactors at the Savannah River Plant, South Carolina. Leaves of Sagittaria latifolia, Salix nigra, Polygonum punctatum, and Scirpus cyperinus averaged 488.2, 303.2, 191.7, and 86.4 picocuries per gram dry weight, respectively. Radiocesium distribution in vegetation was species specific and independent of distance from the effluent entry point. Leaf radiocesium concentrations were generally higher where the streamflow rate decreased due to impoundments, fallen trees, or increased stream width. Radiocesium levels in these plants were log normaly distributed at all sites. A significcant linear relationship existed between the variance and the mean picocuries per gram; however each species had a different slope and intercept. The radiocesium concentrations in one species could not be used to predict concentrations in another. Physical and biological factors should be considered when evaluating the possible influences of radioactive releases on aquatic systems to determine if a system will accumulate radionuclides. Surveys of aquatic systems should determine where contaminants might accumulate. Accessibility of possible contaminants to the biota and public should be considered. (See also W76-10266) (Buchanan-Davidson--Wisconsin)

In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 564-579. 3 tab., 47 ref. AEC C00-3426-3, C00-3329-3.

Descriptors: *Forests, *Seasonal, *Nutrients, *Annual, *Trace elements, Nitrogen, Potassium, Phosphorus, Magnesium, Calcium, Manganese, Foods, Pennsylvania, Vermont, Cycling nutrients, Seeds, Litter.
Identifiers: Mast crops, Fruits, Eastern chipmunks.

Variations in selected nutrients reaching the forest floor as mast were studied monthly in forests near Linesville, Pennsylvania; Tionesta Natural Area, Kane, Pennsylvania; and the Green National Forest, Manchester, Vermont. Approximate nitrogen, potassium, phosphorus, magnesium, calcium, and manganese concentrations were determined in selected parts of species collected. Nitrogen was the most abundant element in edible mast; manganese the least abundant; while the other elements varied. Geographic variations of nutrients in edible mast exceeded two orders of magnitude. Annual variations in macronutrient production exceeded one order of magnitude in Vermont but were approximately half an order of magnitude in Pennsylvania. Seasonal variations were related to species composition and mast crop size at each site. Annual differences in seedfall times varid. Fruits of beech, sugar maple, birch, and fall seed producers reaching the ground before September contained little edible material. Spatial distribution of mast was uneven and varied yearly, especially in Pennsylvania. Relationships between edible mast and litter were not analyzed. Fate of nutrients in mast is known; eastern chipmunks are probably the granivores consuming the mast as edible mast disappears rapidly after reaching the forest floor. Chipmunks are the major method of moving nutrients from forest fruits and seeds in these areas. (See also W76-10266) (Buchanan-Davidson--Wisconsin)

FALLOUT CESIUM-137 AND MINERAL-ELEMENT DISTRIBUTION IN FOOD CHAINS OF GRANITIC-OUTCROP ECOSYSTEMS,
Georgia Univ., Athens. Inst. of Ecology.
D. A. Crossley, K. M. Duke, and J. B. Waide.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 580-587. 2 tab., 14 ref. AEC AT(38-1)-641.

Descriptors: *Cesium, *Nutrients, *Fallout, *Food chains, *Radioisotopes, Georgia, Poteassium, Lichens, Mosses, Plant tissues, Invertebrates, Sodium, Calcium, Carnivores, Mountains, Slopes, Herbivores, Vegetation, Insects, Southeast U. S.
Identifiers: Arthropods, Panola(Ga), Arabia Mountains(Ga), Granitic outcrops.

To understand nutrient conservation mechanisms in ecosystems and provide information on environmental behavior of radioactive materials, fallout cesium-137 movement through arthropod food chains in the Panola and Arabia mountains, granite monadnocks in the Georgia Piedmont region, was studied. Potassium was low in lichen, intermediate in mosses, and highest in vascular plants; similar but lower results were observed for sodium. Calcium was low in lichens and similar in mosses and vascular plants. Cs-137 decreased from lichens to mosses to vascular plants. Parmelia lichens contained the most Cs-137 and Cladonia lichens and mosses concentrated more Cs-137 than most vascular plants. Arthropod food chains on mountain slopes contained 3-5 times more Cs-137 than adjacent areas or mountaintops. Largest Cs-137 levels were found in herbivores from mountain slope areas with reduced concentrations in predators. Food bases were identified by observation and from cesium/potassium ratios in vegetation and arthropods. Lichens were major accumulators of Cs-137 but were not important food sources for arthropods. Cs-137 levels decreased in food chains. Sampling sites did not affect arthropod mineral concentrations. Trophic level effects were observed for sodium but not potassium or calcium; predators contained more sodium than herbivores. Winged forms usually had lower concentrations than wingless forms of all elements at both trophic levels. (See also W76-10266) (Buchanan-Davidson--Wisconsin).

RESOURCE PARTITIONING IN LEAF-LITTER FAUNAS FROM HARDWOOD AND HARDWOOD-CONVERTED-TO-PINE FORESTS,
Battelle-Columbus Labs., Ohio. Ecology and Ecosystems Analysis Section.
B. W. Cornaby, C. S. Gist, and D. A. Crossley.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 588-597. 2 fig., 1 tab., 15 ref. NSF AG-199, 40-193-69, AEC AT(38-1)-641.

Descriptors: *Forests, *Litter, *Leaves, *Biological communities, *Cycling nutrients, Hardwood, White pine trees, North Carolina, Model studies, Detritus, Calcium, Potassium, Deciduous forests, Food webs.
Identifiers: Coweeta Hydrologic Station(NC), Forest litter fauna.

Litter fauna structure and function were measured in hardwood and adjacent white pine watersheds in the Coweeta Hydrologic Station, North Carolina. Models of the role of litter fauna in the watersheds are compared. Biomass of about 18 combined taxa of litter animals were approximately one-third lower, numerical by one-half lower, and calcium and potassium standing crops lower in the pine compared to the hardwood system. Average biomass was 1.30 and 3.81 g/sq m in pine and hardwood watersheds, respectively. In the hardwood watershed 11% of calcium and 3% of potassium from annual leaf-litter inputs were processed by litter animals. Approximately 2% of calcium and 28% of potassium from annual litter inputs entered food webs of pine litter fauna. Pine litter fauna used about 1/10th as much calcium. There was about three times more potassium in pine than hardwood watersheds. The hardwood detrivore calcium standing crop and fauna calcium intake were about ten times larger. Calcium fauna utilization was related to fauna standing crops and perhaps annual litter input, but not litter standing crop. Relationships between potassium standing crops and inputs were not clear. FOREST-FLOOR NUTRIENT DYNAMICS IN SOUTHERN APPALACHIAN HARDWOOD AND WHITE PINE PLANTATION ECOSYSTEMS,
Environmental Protection Agency, Washington, D. C. Office of Environmental Sciences.
J. D. Yount.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 598-608. 2 fig., 3 tab., 14 ref. NSF AG199, 40-193-69.

Descriptors: *Cycling nutrients, *Forests, Hardwood, White pine trees, Litter, North Carolina, Coniferous forests, Deciduous forests, Appalachian Mountain Region, Forest soils, Biomass, Detritus, Carbon, Soil profiles, Decomposing organic matter, Magnesium, Potassium, Calcium, Sodium, Nitrogen, Phosphorus, Microbial degradation, Leaching.
Identifiers: Coweeta Hydrologic Laboratory(NC).

Nutrient contents and detrital biomass in hardwood and white pine forest floors at Coweeta Hydrologic Laboratory, North Carolina, were studied for a year. Total carbon storage was higher in the pine forest floor where the biomass probably approached a steady state. Three pine and two hardwood litter layers were distinguishable; transition from forest floor-soil was sharp in pine and broad in hardwood forests. Comparisons of litter component concentrations through litter profiles indicated dynamics of litter decomposition and elemental mobilities. Ash-free organic matter, magnesium, and potassium decreased; calcium, sodium, nitrogen, and phosphorus increased. Potassium and nitrogen mobilities were high in both forest floors. Magnesium loss was more closely related to structural breakdown in hardwood than pine litter. In both litter types calcium and phosphorus losses were related to loss rate of the whole forest floor. Forest-nutrient pools result from competing porcesses: litterfall, precipitation, leaching, and microbial decomposition, immobilization, or uptake. For nitrogen, fixation, nitrification, and denitrification processes should be added. These processes cause selective calcium and magnesium concentration in hardwood, nitrogen and phosphorus in pine, and potassium and sodium in both forest floors. (See also W76-10266) (Buchanan-Davidson--Wisconsin).

LITTER PRODUCTION, DECOMPOSITION, AND NUTRIENT CYCLING IN A MIXED HARDWOOD WATERSHED AND A WHITE PINE WATERSHED.
Georgia Univ., Athens. Dept. of Botany.

K. Cromack, and C. D. Monk.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 609-624. 4 tab., 45 ref NSF AG-199, 40-193-69, NSF GB-20963.

Descriptors: *Litter, *Biodegradion, *Cycling nutrients, Coniferous forests, Deciduous forests, Hardwood, White pine trees, North Carolina, Biomass, Nitrogen, Phosphorus, Potassium, Calcium, Magnesium, Energy transfer, Leaves, Lignins, Cellulose, Fibers(Plant), Regression analysis.
Identifiers: Coweeta Hydrologic Laboratory(NC).

Nutrient cycling from litter production and litter decomposition in a mixed-hardwood ecosystem were compared with the same processes in an adjacent white pine plantation in the Coweeta Hydrologic Laboratory, North Carolina. Litterfall data (biomass of litter; nitrogen, phosphorus, potassium, calcium, magnesium; and structural organic constituents of leaf litter--lignin, cellulose, and total fiber) were obtained for leaves, stems, flowers, acorns, and miscellaneous debris in the hardwood watershed and for needles, stems, and cones in the pine watershed. Total annual litter production in the hardwood watershed was 4369 kg/ha in 1970-1971, of which 64% was leaf litter. Production of shrubs and herbaceous litter was about 370 kg/ha/year. Pine litter production was 3253 kg/ha/year, of which 98% was needle litter Litter decomposition data were obtained by studying weight loss rates and nutrient loss rates. The first-year litter breakdown rate of confined mixed-hardwood leaf litter was k = -0.70 per year and of confined white pine needle litter was k = 0.46 per year. Litter decomposition rates of chestnut oak, white oak, white pine, red maple, and dogwood could be correlated with senescent leaf carbon-nitrogen ratio and the sclerophyll index, which gave a better statistical estimate of the decomposition rate. W76-10310

CERIUM AND COBALT MOVEMENT WITH LITTER LEACHATE IN A FOREST SOIL,
Oak Ridge National Lab., Tenn. Environmental Sciences Div.
W. A. Thomas.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 625-629. 1 tab, 12 ref.

Descriptors: *Cobalt, *Radioisotopes, *Kinetics, *Translocation, *Forest soils, Root zone, Leachate, Leaves, Deciduous forests, Tennessee, Hickory trees, Penetration, Regression analysis, *Path of pollutants.
Identifiers: *Cerium, Mockernut hickory, Black gum, Chestnut Ridge(Tenn).

To interpret studies of cerium and cobalt circulation in deciduous forests, the rates these elements move downward in soil after release from decomposing leaves were determined. Leachate containing cerium-144 and cobalt-60 from leaf litter of mockernut hickory (Carya tomentosa) and black gum (Nyssa sylvatica) trees was applied to a forest soil, and the rates at which these elements moved downward after release in the litter layer determined. Leachate was applied in a single application, in a single application at twice the concentration, and in four periodic applications over a yearly period. Relative penetration, determined by regression analysis, describing cerium-144 and cobalt-60 distribution four years after the first application did not differ between the different applications, but cerium-144 movement exceeded that of cobalt-60 in all applications. A combination of chemical and physical phenomena retained both elements in the biologically active zones of the soil. The organic layer and the upper three centimeters of the mineral soil contained 68% of the cerium and 91% of the cobalt. The organic layer and upper nine centimeters of mineral soil retained all detectable cerium and cobalt, indicating that these elements will be retained in the biologically active zone in the soil-vegetation-litter nutrient cycle. LEACHING OF NUTRIENTS FROM LEAVES OF SELECTED TREE SPECIES IN NEW HAMPSHIRE,
New Mexico Univ., Albuquerque. Dept. of Biology.
J. R. Gosz, G. E. Likens, J. S. Eaton, and F. H. Bormann.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 630-641. 3 tab, 20 ref. NSF GB1144, GB4169, GB6757, GB6742.

Descriptors: *Cycling nutrients, *Leaching, *Leaves, *Trees, New Hampshire, Forests, Hardwood, Laboratory tests, Calcium, Magnesium, Potassium, Sodium, Nitrogen, Maple trees, Birch trees, New Hampshire, Light intensity
Identifiers: Beech trees, Hubbard Brook Forest(NH)

Although leaching is a very important process in natural, forested watershed ecosystems, its role is not well understood, and because of the complexity of plant communities and environmental interactions, field data are hard to interpret. Therefore laboratory studies were made of the amount and rate of leaching of calcium, magnesium, potassium, and sodium ions and total nitrogen from foliage of different species, leaf types, and maturities. Leaves of sugar maple, yellow birch, and beech were placed in containers of water under controlled conditions. The greatest leaching was observed with sugar maples, followed by yellow birch, then beech. In early summer, sun leaves leached faster than shade leaves, but with increased maturity. This difference was less pronounced and became insignificant after abscission. The rate and amount of leaching for all species and all elements except sodium increased with leaf maturity to a maximum after abscission. The rate of nutrient removal in all three species was potassium, magnesium, calcium, nitrogen and sodium in decreasing order. Loss of sodium from leaves was negligible. The results compared favorably with field studies, so this is a simple, reliable way to evaluate the relative mobility of nutrients in leaf tissue subject to throughfall or decomposition processes. PHOSPHORUS CYCLING IN A MARYLAND DECIDUOUS FOREST SUBJECTED TO VARIOUS LEVELS OF MINERAL-NUTRIENT LOADING,
Smithsonian Institution, Rockville, Md. Radiation Biology Lab.
D. L. Correll, and J. J. Miklas.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 642-657. 2 fig, 4 tab, 19 ref.

Descriptors: *Phosphorus, *Cycling nutrients, *Deciduous forests, *Kinetics, Movement, Leaves, Litter, Forest soils, Mode of action, Maryland, Tracers, Radioisotopes, Chemical reactions.

The phosphorus cycle was studied in a deciduous temperate forest using carrier-free phosphorus-32 to measure overall phosphorus flux rates and pathways. Phosphorus loading of the leaf-litter zone was varied from natural phosphorus levels of 3 to 12 mg to 430 mg/sq m/day. Kinetics of phosphorus flux in leaf litter, at various soil depths, in horizontal transects, and in tree leaves were estimated from rates of change of specific and total activities. Little phosphorus moved very far into the soil before biological assimilation. Within 11 days, chemical fractions in leaf litter were almost uniformly labeled and leaf-litter total phosphorus specific activity was 200 times higher than soil total phosphorus 3 to 5 cm deep; flux rates through leaf litter under natural loading were only about 1% of total leaf litter phosphorus/day. Biological pathways and mechanisms were defined using phosphorus fractions. When loading was increased, the litter phosphorus content increased fourfold, then stabilized. When loading was discontinued, litter phosphorus decreased to original levels in four months. Phosphorus which was not assimilated by leaf litter moved vertically into soil and horizontally within soil inside microbial cells. Forest trees obtained most of their phosphorus from the litter zone. (See also W76-10266) (Buchanan-Davidson--Wisconsin)

MOBILIZATION OF NUTRIENTS IN SOIL BY ACIDS OF SULFUR AND CHELATING AGENTS,
California Univ., Los Angeles, Lab., of Nuclear Medicine and Radiation Biology.
A. Wallace, E. M. Romney, and J. Procopiou.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 687-693. 2 tab., 13 ref. AEC AT (04-1) GEN 12, AT(04-3)-34.

Descriptors: *Cycling nutrients, *Acid base equilibrium, *Salts, *Vegetation, *Sulfur, *Chelation, Air pollution, Hydrogen ion concentration, Southeast U. S., Solubility, Absorption, Heavy metals, Lime, Soybeans, Manganese, Iron, Zinc, Copper, Cobalt, Nickel, Phosphorus, Silver, Magnesium, Lithium, Aluminum, Barium, Potassium, Calcium, Barley, Molybdenum.

Atmospheric precipation of sulfur on southeastern ecosystems was studied by measuring effects of soil acidification with sulfur on ion uptake by plants and leaching from soil. Slightly acid soil (Yolo loam) was treated with sulfur or lime to determine effects on mineral mobilization by soybeans (Glycine Max) and barley (Hordeum vulgare). The soils were treated with the chelator, ethylenediamine tetraacetic acid. With soybeans acidification decreased yields; increased plant manganese, iron, and zinc and increased soil copper, cobalt, nickel, phosphorus, silver, and magnesium; and decreased molybdenum and varium availability. Lime had the opposite effect, and increased molybdenum levels in soybeans and soil. EDTA increased iron and decreased manganese in pH 6.0 and 4.5 soils; increased leaf iron, manganese, zinc, and copper at pH 7.5 and cobalt and nickel at pH 6.0 and 4.5, but did not affect soybean accumulations of other elements. With barley, acidification increased manganese, cobalt, lithium, and aluminum and decreased molybdenum, barium, phosphorus, potassium, and calcium; except for iron at pH 4.5, there was little interaction with EDTA. Acidification can change soil mineral solubilities and increase plant heavy metal concentrations. Atmospheric sulfur could affect mineral recycling in ecosystems with poorly buffered soils; interactions with soil organic constituents which chelate minerals are possible. ASPECTS OF MINERAL-NUTRIENT CYCLING IN A SOUTHERN MIXED-HARDWOOD FOREST IN NORTH CENTRAL FLORIDA,
Florida Univ., Gainesville. Dept. of Botany.
K. C. Ewel, J. F. Gamble, and A. E. Lugo.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 700-714. 1 fig., 4 tab., 20 ref. AEC AT(40-1)-4066.

LIBRARY U. OF I. URBANA-Champaign

Descriptors: *Cycling nutrients, *Mixed forests, Florida, Cesium, Radioisotopes, Hardwood, Fallout, Southeast U. S. rainfall, Leaching, Soil types, Groundwater, Stemflow, Throughfall, Phosphorus, Potassium, Calcium, Magnesium, Phizosphere.

To determine if cesium-137 accumulates in a natural system in a compartment which has a counterpart in a managed system, mineral cycles were studied in a relatively undisturbed ecosystem (a mixed-hardwood forest near Gainesville, Florida, which contained several species of evergreen hardwoods as canopy dominants). Special attention was given to pathways which might affect cesium distribution in the ecosystem. Seasonal analysis was made of rainfall composition to determine how it was affected by different ecosystem components encountered as water travelled to the forest floor and leached through the soil system to groundwater. Stemflow, throughfall, and rainfall samples were collected for two years and mineral nutrient inputs (phosphorus, calcium, magnesium, potassium) to the forest floor estimated. Total nutrient inputs were phosphorus-32, potassium--24.7, calcium--29.7, and magnesium--8.1 kg/ha/year. Nutrient concentrations were unusually high in rainfall. Species of evergreen trees seemed to play an important role in making these values higher than those from temperate hardwood forests. There was a simildarlity in potassium and Cs--137 concentration patterns. In samples from lysimeters and groundwater pits, potassium and Cs-137 concentratios dropped considerably as the water passed through the root zone in the soil, possibly due to mycorrhizal uptake. THE QUANTITY AND DISTRIBUTION OF FOUR NUTRIENT ELEMENTS IN HIGH-ELEVATION FOREST ECOSYSTEMS, BALSAM MOUNTAINS, NORTH CAROLINA,
Southern Illinois Univ., Carbondale, Dept. of Forestry.
G. T. Weaver.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 715-728. 5 tab., 36 ref. AEC AT(401)-2077.

Descriptors: *Nutrients, *Mountain forests, North Carolina, Calcium, Potassium, Magnesium, Phosphorus, Distribution, Fir trees, Birch trees, Vegetation, Forest soils, Trees, Shrubs, Mosses, Soil horizons.
Identifiers: *Balsam Mountains(NC), Red spruce, Forest floor.

Calcium, potassium, magnesium, and phosphorus concentration and distribution patterns were studied in red spruce (Picea rubens)-Fraser fir (Abies Fraseri) and yellow birch (Betula lutea) ecosystems in the Balsam Mountains, North Carolina, to see if nutrient pool size and location characterized ecosystems. Relative nutrient quantities decreased in order from calcium:potassium:magnesium:phosphorus. Except that phosphorus amounts differentiated immature ecosystems, ecosystems were not characterized by nutrient pool size. Nutrient sinks for calcium were equal in vegetation and forest floor but lower in soil; in the spruce-fir ecosystem, magnesium, phosphorus, and potassium values were higher in the forest floor than vegetation and lower in soil; in the yellow birch ecosystem, vegetation, soil, and forest floor potassium values were equal. Nutrient distribution differentiated these ecosystems. Larger trees and shrubs contained most of the nutrients in the vegetational compartment. Most nutrients were in boles in the spruce-fir ecosystem, but branches were equal or more important in yellow birch ecosystems. Mosses and herbs were important nutrient sinks in habitats where they developed. Within the forest floor most calcium and magnesium were in the 01 horizon and potassium and phosphorus in the 02 horizon. Relative dry matter distribution did not indicate nutrient distributions reliably. (See also W76-10266) (Buchanan-Davidson--Wisconsin).
W76-10319

SIGNIFICANCE OF BIOLOGICAL NITROGEN FIXATION AND DENITRIFICATION IN A DECIDUOUS FOREST ECOSYSTEM,
Georgia Univ., Athens. Dept. of Agronomy.
R. L. Todd, J. B. Waider, and B. W. Cornaby.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 729-735. 2 tab., 26 ref. NSF AG 199,40-193-69.

Descriptors: *Nitrogen fixation, *Denitrification, *Deciduous forests, *Nitrogen cycle, North Carolina, Litter, Forest soils, Oak trees, Hickory trees, Input-output analysis.
Identifiers: Coweeta Hydrologic Laboratory(NC), Forest floors.

Gaseous nitrogen transformations were determined in relation to other nitrogen cycle components of a mixed deciduous forest ecosystem at the Coweeta Hydrologic Laboratory, North Carolina. Rates and total annual amounts of nitrogen fixation and potential denitrification were measured for litter-soil subsystem components (decaying logs, woody and leaf litter, and general soil layers) of a mature oak-hickory forest. Woody and leaf litter had thehighest nitrogen fixation and denitrification rates, but annually on a surface area basis, the largest nitrogen transformations occurred in soil. About 75% of total nitrogen input entered the forest floor via biological fixation. Potential denitrification losses exceeded streamwater losses 200-fold. Aqueous nitrogen inputs and outputs are major forest nitrogen cycle components and dominate total gains and losses. Total nitrogen input was 14 and output 18 kg/ha/year, suggesting that the watershed may be losing nitrogen slowly. The estimates did not include epiphytic N fixation in the aboveground vegetation nor particulate organic N input in bulk precipitation. These nitrogen fixation values are comparable to values for coniferous forests and may be applicable only for forests. Nitrogen fixation, denitrification, and total fluxes must be considered when examining forest nitrogen cycles. Existing nitrogen pools may not indicate the magnitude of gaseous transformations that are occurring. (See also W76-10266) (Buchanan-Davidson--Wisconsin).

NUTRIENT RETURN IN THE STEMFLOW AND THROUGHFALL OF INDIVIDUAL TREES IN THE PIEDMONT DECIDUOUS FOREST,
Duke Univ., Durham, N. C. Dept. of Botany.
D. T. Patterson.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 800-812. 6 tab., 18 ref.

Descriptors: *Cycling nutrients, *Rainfall, *Stemflow, *Throughfall, *Deciduous forests, Hickory trees, Pine trees, Loblolly pine trees, Oak trees, North Carolina, Bark, Interception, Chemical analysis, Calcium, Potassium, Magnesium, Manganese, Forest soils, Hydrogen ion concentration.
Identifiers: Piedmont, American beech trees, Yellow poplar trees, Shortleaf pine trees.

Quantitative and qualitative aspects of rain stemflow and throughfall of individual mature trees (American beech, mockernut hickory, yellow poplar,shortleaf pine, loblolly pine, and white oak) in an oak-hickory forest in North Carolina were evaluated. Because of branching patterns and bark characteristics, stemflow varied widely. Beech produced the most stemflow, then hickories; interception loss was greatest with beech trees. Only under hickory and beech did stemflow conduct much water to the forest floor. Chemical analysis of stemflow and throughfall showed that more calcium and potassium were returned to soil, followed by magnesium and manganese. Nutrients were always higher in stemflow, but total nutrient returns were greater in throughfall because more water reached the soil. On a crown-area basis, beeches contributed the least calcium and potassium, loblolly pines the most calcium, and hickories the most potassium. Stemflow and throughfall pH values were lowest in pine and highest in hickories. Soil nutrient patterns near trees were related to stemflow distribution and nutrient content of the several species. Soil potassium under hardwoods was higher in the stemflow absorption zone than under the crown edge. Soil calcium was higher near hickory and oak trunks. (See alo W76-10266) (Buchanan-Davidson--Wisconsin)

CATION FLUX IN HARDWOOD AND WHITE PINE WATERSHEDS,
Georgia Univ., Athens. Dept. of Botany.
G. R. Best, and C. D. Monk.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 847-861. 1 fig., 2 tab., 36 ref. NSF AG-199,40-193-69.

Descriptors: *Cycling nutrients, *Cations, *Hardwood, *White pine trees, Calcium, Magnesium, Potassium, Sodium, Forests, Rainfall, North Carolina, Precipitation(Atmospheric), Input-output analysis, Throughfall, Litter, Percolation, Forest soils, Leaching, Runoff.
Identifiers: Coweeta hydrologic laboratory(NC).

Flux of selected dissolved cations (potassium, sodium, calcium, magnesium) through various levels of a forest from input of ions in rainfall to output of ions from the watershed in stream discharge was followed in a mature hardwood forest and an eastern white pine plantation in the Coweeta Hydrologic Laboratory, North Carolina. Nutrient concentrations were determined in precipitation input, throughfall, litter flow through, soil percolation, and stream discharge. Nutrient flux was determined from concentration and volume measurements. Amounts of water passing through various forest ecosystem levels changed markedly from input to output. Cation leaching from vegetation showed seasonal changes; potassium, calcium, and magnesium leaching was lower during winter months and increased with start of spring growth. Most potassium was leached from leaves before leaf fall, but most calcium and magnesium losses occurred after leaf fall. A summer reduction of sodium in throughfall was observed in the white pines. Total leachate loss from vegetation was highest for potassium and lowest for sodium; magnesium and calcium losses were intermediate. When water became streamflow discharge, the cation load was similar to its original input level, indicating that the ecosystem was able to minimize external loss while maintaining a large internal flux. Descriptors: *Toxicity, *Bioassays, Water quality, *Metals, *Chelation, Chemical analysis, Pollutant identification, Water analysis, Solubility, Acidity, Bonding, Salinity, Water chemistry, Laboratory tests, Ions.
Identifiers: Free metal ions, Metal concentration, Tissue concentration, Complexation.

Divalent metal ions interact with the anions normally observed in natural waters. As a result, the concentration of free metal ions in a test solution made with these waters is markedly lower than the quantity added would lead one to expect. This leads to uncertainty regarding the identity and physical state of the causative agent of the observed response. Laboratory determination of metal concentration in natural waters and in marine animal tissue requires careful choice of analytical method and meticulous attention to detail in preparative method. MARINE POLLUTION MONITORING (PETROLEUM). PROCEEDINGS OF A SYMPOSIUM AND WORKSHOP,
National Oceanographic and Atmospheric Administration, Rockville, Md.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402 Price $3.90. Department of Commerce, National Bureau of Standards, Special Publication 409, (December,1974). 316 p. Held at National Bureau of Standards, Gaithersburg, Md. May 13-17, 1974. R. C. Junghaus, Conference Coordinator.

Descriptors: *Analytical methods, *Oil spills, *Oil industry, Oil wastes, Data transmission, International waters, Water pollution, Water quality sampling, Monitoring, *Data collection, *Conferences.
Identifiers: *Marine pollution, Petroleum hydrocarbon measurement, Oil slicks, Tar balls.

These proceedings contain the invited plenary lectures representing pertinent scientific, environmental, and regulatory aspects of petroleum hydrocarbon measurements, the summaries of the contributed papers, dealing with specific scientific developments and recommendations, and the report of an international workshop which provides specific recommendations for the initiation of a coordinated Pilot Project for marine pollution (petroleum) monitoring. (See W76-10371 thru W76-10413) (Katz)
W76-10370

UNITED NATIONS ENVIRONMENT PROGRAM EARTHWATCH AND MARINE POLLUTION,
National Oceanic and Atmospheric Administration, Rockville, Md.
R. M. White.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum) Proceedings of a Symposium and Workshop, December, 1974, p. 3-7.

Descriptors: *International waters, Water pollution, Monitoring, Data collections, Water pollution Control, Federal government, United Nations.
Identifiers: *Marine pollution, *Earth watch.

The United Nations environment program realized the importance of monitoring ocean pollution and established monitoring as one of the seven major goals of the Global Environmental Monitoring System. It is hoped that the Intergovernmental Oceanographic Commission and the World Meteorological Organization, through the Integrated Global Ocean Station System (IGOSS) will be able to translate this general concern into a working international effort. (See also W76-10370) (Katz)
W76-10371

SCIENTIFIC PROBLEMS OF THE SYSTEMS FOR GLOBAL MONITORING AND INVESTIGATION OF OIL POLLUTION IN THE WORLD OCEAN,
State Oceanographic Inst., Moscow (USSR).
A. I. Simonov.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum). Proceedings of A Symposium and Workshop, December, 1974, p. 9-14.

Descriptors: *Hydrodynamics, *Dispersion, Oil pollution, Monitoring, International waters, Data collections, Oil wastes, Atlantic Ocean, Degradation(Decomposition).
Identifiers: Global monitoring, Marine pollution.

Discussion is presented of: (1) a continuous and systematic monitoring and evaluation of oil and oil product pollution conditions in the waters of the world oceans, (2) studies of the increasing utilization of oil and oil products as these uses affect the sea (3) the development of regulations concerning the discharge of substances containing petroleum originated hydrocarbons into the sea. (See also W76-10370) (Katz)
W76-10372

PILOT PROJECT ON MARINE POLLUTION MONITORING UNDER THE FRAMEWORK OF IGOSS,
Intergovernmental Oceanographic Commission, Paris (France).
A. Tolkachev.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum). Proceedings of a Symposium and Workshop, December, 1974, p. 21-26.

Descriptors: *Monitoring, *Oil pollution, *Oil spills, Water pollution, Data transmission, International waters, Water quality, Sampling, Data collections, Pilot plants, Oily waters, Oceanography.
Identifiers: *Marine pollution.

The International Oceanographic Commission (IOC) emphasizes the need to undertake specific studies of various aspects of marine pollution and recommends specific action to achieve these goals. The outlines of a pilot project on marine pollution monitoring is presented. (See also W76-10370) (Katz)
W76-10373

SURVEY ANALYSES FOR PETROLEUM DERIVED HYDROCARBONS IN THE OCEAN,
Maritime Safety Agency, Tokyo (Japan). Oceanographic Div.
S. Hori.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum). Proceedings of a Symposium and Workshop, p. 27-28.

Descriptors: Oil pollution, *Water pollution, *Water chemistry, *Analytical techniques, Monitoring, Oily water, Oil spills, Indian Ocean, Pacific Ocean, Surveys.
Identifiers: *Japan, Petroleum residues, Tokyo Bay, Marine sampling, *Marine pollution.

Fisheries training ships or fisheries research vessels collect samples for petroleum analyses as part of their operations. The Hydrographic Department of the (Japanese) Maritime Safety Agency conducts chemical analyses to study the present level of marine oil pollution. (See also W76-10370) (Katz)

QUANTITATIVE MONITORING AND VARIABILITY OF PELAGIC TAR IN THE NORTH ATLANTIC,
Harvard University, Cambridge, Mass. Dept. of Engineering and Applied Physics.
J. N. Butler, and B. F. Morris.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum). Proceedings of a Symposium and Workshop, December, 1974. p. 75-78, 6 fig., 13 ref.

Descriptors: *Sampling, *Floating plants, Atlantic Ocean, Statistical analysis, Homogeneity, On-site data collections, Oil pollution, Oil spills, Plankton nets, Aquatic algae, Marine plants, *Monitoring.
Identifiers: *Sargassum, *Pelagic tar, *Tar, *Neuston, Oil residues, Bermuda, Sargasso Sea, Tar analysis, Marine pollution.

The variability of sampling by neuston net for either pelagic tar or Sargassum is very high, and even the results of successive tows may differ by a factor of ten. The standard deviation is of the order of 0.5 log units, a factor of 3. The standard deviation of the geometric mean of ten to fifteen neuston tows may be estimated to be approximately 0.15 log units, or 40%. In other words, a single neuston tow is representative of the general area where the tow is made only within a factor of ten. (See also W76-10370) (Katz)
W76-10378

TAR BALL LOADINGS ON GOLDEN BEACH, FLORIDA,
Coast Guard Research and Development Center, Groton, Conn.
W. A. Saner, and M. Curtis.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum). Proceedings of a Symposium and Workshop, December, 1974, p. 79-81, 3 fig.

Descriptors: *Atlantic Ocean, *Oil pollution, *Beaches, *Sands, Winds, *Florida, Sampling method, Statistical analysis, Intertidal area, Weather patterns.
Identifiers: Fort Lauderdale(Fla), Miami(Fla), Tar balls, Tar ball loadings, Beach sampling methods, Beach time constant, Beach bias.

Data from the sampling of beach tar from a sandy coast was performed for one year. The objective was to evaluate the effect of sampling zones of various sizes and the effects of tar build-up on the beach with time. The effect of wind on tar deposition was also determined. (See also W76-10370) (Katz)
W76-10379

TAR BALL SAMPLING IN THE WESTERN NORTH ATLANTIC,
Coast Guard Research and Development Center, Groton, Conn.
W. E. McGowen, W. A. Saner, and G. L. Hufford.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p. 83-84, 1 tab., 11 fig.

Descriptors: *Atlantic Ocean, *Sampling, Oil pollution, Analytical techniques, On-site investigations, Oily water.
Identifiers: Oil sampling techniques, Oil identification, Bravo, Charlie, Delta, Echo, Marine pollution.

The U. S. Coast Guard conducted a sampling program in the western North Atlantic Ocean beginning in 1971 to determine the quantity and source of floating tar 'balls' in the marine environment. Most of the sampling was performed from Coast Guard weather ships deployed at four ocean station sites: Bravo (56 degrees 30' N, 51 degrees 00' E), Charlie (52 degrees 45' N, 35 degrees 30' W), Delta (44 degrees 00' N, 41 degrees 00' W) and Echo (35 degrees 00' N, 48 degrees 00' W). The series sampling at each location allowed a determination of variability and estimation of the average amount of tar present. (See also W76-10370) (Katz)

OIL SPILLAGE MONITORING, SAMPLING AND RECOVERY SYSTEMS,
Durham Associates, Inc., Milford, N. H.
J. G. Zahka.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p. 89-90.

Descriptors: *Oil pollution, *Monitoring, Methodology, *Oily water, *Physicochemical properties, Physical properties, Water analysis, On-site data collections, *Sampling.
Identifiers: Oil detection, Oil sampling, Oil recovery, Selective membrane.

Products have been developed by Durham Associates, Inc. for use in controlling marine pollution from petroleum. They incorporate a unique selectivity transmissive membrane which, while preventing the penetration of water, allows oil to flow through easily. Modifications of this membrane have been used in the construction of oil spill detection systems, oil recovery devices, and surface oil samplers. (See also W76-10370) (Katz)
W76-10382

SAMPLING OF OIL SPILLS AND FINGERPRINTING BY INFRARED SPECTROSCOPY,
Rhode Island Univ., Kingston, Dept. of Chemistry.
C. W. Brown, M. Ahmadjian, and P. Lynch.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p. 91-92, 1 fig., 3 ref.

Descriptors: *Oily water, Methodology, *Monitoring, *Spectroscopy, Water pollution, Analytical methods, Oil spills, Chemical analysis, Water pollution sources, *Secondary recovery(Oil), Pollutant identification.
Identifiers: Infrared spectroscopy, Oil slick, Narragansett Bay(RI), Fingerprinting.

Infrared spectra of crude oils and their various distillates in the 650 to 1200 cm-1 region provide unique fingerprints, which can be used to identify the source of oil slicks. (See also W76-10370) (Katz)
W76-10383

MAPPING AND IDENTIFICATION OF OIL ON WATER BY THE USE OF AN AIRBORNE LASER SYSTEM,
National Aeronautics and Space Administration, Wallops Island, Va. Wallops Station.
G. K. Schwemmer, and H. H. Kim.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p. 95-96, 5 fig., 3 ref.

Descriptors: *Remote sensing, *Aerial reconnaissance, *Analytical techniques, Oily water, *Oil spills, *Aircraft, Methodology, *Photometry, *Oil pollution, Mapping, *Pollutant identification, Path of pollutants.
Identifiers: Oil on water, *Airborne laser system, Airborne laser sensor, Laser, Laser induced emission.

Airborne laser oil fluorosensor systems have been test flown both here and elsewhere for the detection of oil on water. Recently there has been increased interest in developing an advanced model which not only detects but also performs a broad classification of the target oils according to their grades. (See also W76-10370) (Katz)
W76-10384

MOVEMENT OF SPILLED OIL IN SAN FRANCISCO BAY AS PREDICTED BY ESTUARINE NONTIDAL DRIFT,
Geological Survey, Menlo Park, Calif.
T. J. Conomos.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p. 97-100, 5 fig., 16 ref.

Descriptors: *Oily water, *Aquatic drift, *Water currents, *Oil pollution, Estuarine environment, Straits, *Oil spills, California, *Path of pollutants, Bays, Forecasting.
Identifiers: Estuarine water circulation, Non-tidal drift, Sea bed drifters, Surface drifters, *San Francisco Bay, Continental shelf.

From March 1970 through April 1973, the U.S. Geological Survey released surface and seabed drifters every 2 months within San Francisco Bay and on the continental shelf of central California as a part of a study of seasonal nontidal drift patterns in the Bay. One of the routine release points was located at the site of a major oil spill which occurred on 18 January 1971 when two oil tankers collided at Golden Gate, San Francisco Bay, California. Approximately 3200 m3 (26,700 barrels) of Bunker C fuel oil spilled into the bay. Marked similarities between the drift patterns of the spilled oil and that of both the surface and seabed drifters became immediately obvious. These similarities, together with 3 years of data from the drifter study made it possible to predict the movement of spilled oil. (See also W76-10370) (Katz)
W76-10385

OIL POLLUTION ALONG THE INDIAN COASTLINE,
National Inst. of Oceanography, Panjim (India).
S. N. Dwivedi, and A. H. Parulekar.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workship, December, 1974. p. 101-105, 2 tab., 4 fig., 3 ref.

Descriptors: *Oil pollution, *Indian Ocean, Beaches, Marine algae, Polychaetes, *Oil spills, *Deposition(Sediments).
Identifiers: Tar balls, Tide levels, Rhozopora fruits, Physalia, Degradation products, Marine pollution.

Oil in the form of tar balls is washed ashore along the Indian beaches. These were first noticed in 1970. From 1971 to 1973, studies were undertaken along both east and the west coasts of India to determine the areas, seasons, and the intensity of deposition of tar balls and their possible origin. The size of the tar balls, places and seasons of deposition vary a great deal. Therefore, for com-

parison of data from selected beaches, duplicate samples were collected from 0.1 m2 surface at supra, high, mid and low tide marks and the weight of tar balls was determined and expressed as g/m2. (See also W76-10370) (Katz)

HYDROCARBON CONTENT AND CHLOROPHYLL CORRELATION IN THE WATERS BETWEEN NOVA SCOTIA AND THE GULF STREAM,
Bermuda Biological Station for Research, St. George's West.
A. Zsolnay.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workship, December, 1974, p. 255-256, 9 ref.

Descriptors: *Atlantic Ocean, *Organic compounds, *Water quality, *Chlorophyll, Laboratory studies, Statistical analyses, Chemical analysis, *Canada, Eutrophication.
Identifiers: Euphotic zone, Nova Scotia, Gulf Stream, *Biogenic hydrocarbons.

Studies have indicated that a casual relationship exists between the hydrocarbon and chlorophyll concentration of the euphotic zones of the Atlantic between Nova Scotia and the Gulf Stream. One cannot assume, however, that phytoplankton are the sole source of this material. (See also W76-10370) (Katz)

MEASUREMENT AND CHARACTERIZATION OF NONVOLATILE HYDROCARBONS IN OCEAN WATER,
Exxon Research and Engineering Co., Linden, N. J.
R. A. Brown, J. J. Elliott, and T. D. Searl.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p 131-135, 2 tab, 2 fig, 2 ref.

Descriptors: *Chromatography, *Oily water, Oil pollution, Methodology, Analytical techniques, Water quality, Gas chromatography, Transportation, Ships, Marine water, *Pollutant identification.
Identifiers: Hydrocarbons, Tanker routes, Lipids, Hydrocarbon measurements, Lipid measurements.

A method is described for the measurement and characterization of nonvolatile hydrocarbons, (C-14 and heavier) in ocean water. The method was applied to total dispersed hydrocarbons which generally occur in the concentration range, 0-20 ppb (wt.). (See also W76-10370) (Katz)
W76-10394

IDENTIFICATION, ESTIMATION AND MONITORING OF PETROLEUM IN MARINE WATERS BY LUMINESCENCE METHODS,
Baird-Atomic, Inc., Bedford, Mass.
A. W. Mornig.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p 135-144, 14 fig, 20 ref.

Descriptors: Analytical techniques, *Waste identification, *Spectroscopy, *Fluorescense, Oil pollution, Oily water, Methodology, Remote sensing, Tracers, Water pollution, *Monitoring, *Pollutant identification.
Identifiers: Oil classification, Oil fluoresence, Oil identification, Low temperature luminescence, Molecular luminescence, Phosphorescence, Total luminescence, Spectroscopy.

Fluorescence analysis is more sensitive and less subject to interference than the simple absorbance method and is therefore superior, especially when the concentration of residual oils in the sea water are less than 10 ppb. Luminescence offers a specific and sensitive method for the study of oil in water. (See also W76-10370) (Katz)

USE OF LOW MOLECULAR-WEIGHT-HYDROCARBON CONCENTRATIONS AS INDICATORS OF MARINE POLLUTION,
Texas A and M Univ. College Station, Dept. of Oceanography.
W. M. Sackett, and J. M. Brooks.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p. 171-173, 1 fig., 5 ref.

Descriptors: *Oily water, *Oil pollution, *Gulf of Mexico, Indicators, Marine organisms, Environmental effects, Industrial wastes, Path of pollutants, Pollutant identification, Water quality, *Bioindicators.
Identifiers: *Hydrocarbon sniffer, *Low-Molecular-Weight hydrocarbons, *Pollution indicators, Petroleum production platforms, Dissolved ethane, Exposed well heads, *Marine pollution.

Large areas of coastal water offshore Texas and Louisiana have up to six orders of magnitude higher concentrations of low-molecular-weight hydrocarbons than open ocean surface water. These high levels are most certainly petroleum-derived and due to offshore petroleum production operations. The observed high levels of C1 to C3 hydrocarbons do not seem to be detrimental to marine life, but nevertheless serve as sensitive indicators of the more toxic components of petroleum which usually are being simultaneously introduced to the ocean. (See also W76-10370) (Katz)

HYDROCARBONS IN BLUE MUSSELS FROM THE KIEL BIGHT,
Kiel Univ. (West Germany). Institut fuer Meereskunde.
M. Erhardt, and J. Heinemann.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974, p. 221-225, 1 tab., 6 fig., 5 ref.

Descriptors: *Benthic organisms, *Marine animals, *Mollusks, *Mussels, *Oil pollution, *Gas chromatography, *Waste identification, Oily water, Water quality, Mass spectrometry, On-site investigations, *Pollutant identification.
Identifiers: *Fossil hydrocarbon, *Tissue accumulation, *Hydrocarbon exchange, *Biogenic hydrocarbons, Degrading hydrocarbons.

Blue mussels (Mytilus edulis) from a location in the Kiel Bight, contain fossil hydrocarbons in concentrations somewhat above the natural background of recent biogenic hydrocarbons. The composition of the hydrocarbon fraction is not constant. Mussels collected after the spring phytoplankton bloom contain relatively large amounts of recent biogenic hydrocarbons whose concentrations in mussels collected in January are quite low. On the other hand, concentrations of cycloalkanes, mono-, di-, and tri-aromatics as well as mixed types of fossil origin have a tendency to rise. (See also W76-10370) (Katz)
W76-10408

PELAGIC TAR IN THE GULF OF MEXICO AND CARIBBEAN SEA,
Texas A and M Univ., College Station. Dept. of Oceanography.
L. M. Jeffrey, W. E. Pequegnat, E. A. Kennedy, A. Vos, and B. M. James.
In: NBS Special Publication 409, Marine Pollution Monitoring (Petroleum), Proceedings of a Symposium and Workshop, December, 1974. p. 233-235, 1 tab., 3 fig., 3 ref.

Descriptors: *Oil pollution,l *Oil-water interfaces, Ships, *Gulf of Mexico, Waste identification, Transportation, Organic compounds, *Pollutant identification.
Identifiers: Gulf Stream, *Pelagic tar, Tar balls, *Caribbean Sea, Sulfur or tar balls, Asphaltene of tar balls, Marine pollution.

The Gulf of Mexico apparently has less pelagic tar than the Mediterranean and Sargasso Sea, but more than the Caribbean and northeast Pacific but about the same amount as the Gulf Stream. Some of the pelagic tar is swept into the Gulf of Mexico through the Yucatan Straits and out through Florida Straits and is derived primarily from shipping and tanker cleaning operations. Specific sources are difficult to ascertain of these obviously weathered materials, so a multi-parameter approach is necessary. See also W76-10370) (Katz)

TIME-DEPENDENT MASS DISPERSION IN NATURAL STREAMS,
Dames and Moore, Bethesda, Md.
F. M. Holly, Jr., and J. A. Cunge.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1121-1137, 1975. 7 fig, 12 ref.

Descriptors: *Model studies, *Streams, *Dispersion, *Diffusion, Mathematical models, Rivers, Mass transfer, Water pollution, Pollutants, *Path of pollutants, Water quality, Computer models, *Virginia.
Identifiers: *Finite difference model, *Clinch River(Va).

A finite-difference model for the prediction of time-dependent mass dispersion in steady but nonuniform river flow was presented. Specific attention was devoted to problems of convergence in the computation of convection. The model is non-diffusive and unconditionally stable, and is applicable to mixing from sources of arbitrary configuration. Application of the model to field measurements of one-dimensional mixing in Clinch River, Virginia, demonstrated its ability to provide good estimates of dispersion using relatively little computer time and with minimum calibration. SCALING AND SIZING CRITERIA FOR THERMAL-HYDRAULIC MODELS,
Acres Consulting Services Ltd., Niagara Falls (Ontario).
S. T. Lavender, and J. E. Cowley.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1156-1164, 1975. 4 ref, 1 append.

Descriptors: *Model studies, *Thermal pollution, *Thermal powerplants, Hydraulic models, Powerplants, Diffusion, Dispersion, Jets, Buoyancy, Mass transfer, Cooling, Cooling water, Hydraulics.
Identifiers: *Model scaling, Boundary influence.

The principles of scaling for models of heated water flows have been expounded by a number of

authors. These fall short of defining explicit requirements for scale and boundary selection for a specific model. Criteria which recognize established principles and which have been applied in choosing scales and model sizes for several very large thermal-hydraulic models were presented. APPLICATION OF A WATER QUALITY MODEL TO THE DENVER METROPOLITAN AREA,
Black and Veatch, Denver, Colo.
V. P. Soice.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1165-1182, 1975. 9 fig, 1 tab, 3 ref.

Descriptors: *Model studies, *Urban hydrology, *Water quality, *Colorado, Mathematical models, Computer models, Water pollution, Pollutants, Streams, Rivers, Urban runoff, Urban drainage, Watersheds(Basins), Rainfall.
Identifiers: *Denver(Colo).

The utilization of sophisticated digital computer models for analyzing alternative wastewater treatment systems is a relatively recent innovation in water resources engineering. Because of the complexity of the stream system and water use patterns in the Denver Metropolitan area, full dynamic simulation of water quantity and quality was utilized in a study of regional water quality management. Complicating water quality and quantity factors and a desire to effect a regional approach to management of the region's quality resulted in selection of the hydrologic and water quality programming packages offered by Hydrocomp International, Palo Alto, California. The model as adapted to the Denver area is known as the Hydro-Quality Model and is characterized as a nonuniform, unsteady state model that provides continuous dynamic simulation of water quality and quantity constituents. The model was calibrated utilizing an extensive meteorological data base, adjusting basin parameters to produce simulated stream flow and water quality and comparing this result with historically recorded values. A satisfactory calibration achieved, the model was utilized as an analytical tool to determine through simulation the resultant water quality in the stream network under various alternative wastewater management systems. Model results for the various alternatives were compared against one another and against predetermined water quality goals. This paper discussed the procedures utilized in applying this particular model and evaluated its effectiveness as a tool to manage regional water quality. (See also W76-10415) (Sims-ISWS)

COMBINED USE OF PHYSICAL AND MATHEMATICAL MODELS FOR ANALYSIS OF RESERVOIR WATER QUALITY,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
J. P. Bohan, and B. Loftis.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1183-1195, 1975. 3 fig, 10 ref.

Descriptors: *Model studies, *Water quality, *Hydraulic models, *Mathematical models, Reservoirs, Heat transfer, Dissolved oxygen, Biochemical oxygen demand, Discharge(Water), Withdrawal, Inflow, Mixing, Water circulation, Pollutants, Path of pollutants, Water pollution, Analytical techniques.

Numerical simulation models for predicting reservoir water quality have emerged rapidly during the past few years. Unfortunately, the description in these models of the hydrodynamics of a density stratified reservoir has not progressed as rapidly as the need to predict water quality. This paper described the concepts of the numerical simulation model and the use of the physical models to improve the mathematical descriptions. An accurate determination of reservoir water quality is dependent upon the ability to describe water movement through a reservoir and account for retention times of various layers. The physical model provides a means of determining this information. The information gained from the physical model can be used to modify the mathematical model. Entrainment currents, exchanges between layers, inflow placement and distribution, currents created by withdrawal, and travel times can be accounted for satisfactorily in a one-dimensional reservoir simulation model. This technique provides a more accurate description of the water budget which contributes to the accuracy of the water quality predictions. (See also W76-10415) (Sims-ISWS)

APPLICATION OF A DYNAMIC NETWORK MODEL TO HYDRAULIC AND WATER QUALITY STUDIES OF THE ST. LAWRENCE RIVER,
M. L. Thatcher, H. W. Pearson, and R. E. Mayor-Mora.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1196-1219, 1975. 15 fig, 4 tab, 9 ref.

Descriptors: *Model studies, *Water quality, *St Lawrence River, *Mathematical models, Hydrodynamics, Hydraulics, Pollutants, Path of pollutants, Nutrients, Dissolved oxygen, Biochemical oxygen demand, Coliforms, Zooplankton, Phytoplankton, Inflow, Discharge(Water), Water levels, Rivers, Water quality control.

A network-type numerical model of hydraulics and water quality has been implemented to provide predictive capability in the study of the St. Lawrence River from Cornwall, Ontario, past Montreal and downstream into the tidal region as far as Montmagny, Quebec. The M.I.T. Dynamic Network Model was adopted for this study. It consists of a coupled solution to the governing equations of transient hydraulics and mass transport for a network of one-dimensional reaches of variable cross-sectional area. Modifications were made to the original model to adapt it for ice cover, to provide for continuity across control structures, and to include additional water quality parameters including an interactive nutrient model. Verification was made to steady-state conditions in the non-tidal region and to transient conditions in the tidal region. The model represents a management tool for predicting the results of different hydraulic and water quality conditions. These conditions can be natural ones such as floods, icing, storm tides and storm water runoff, or they can be related to human activity such as dam regulation, changes in river geometry, degrees of waste water treatment, and the location of outfalls. FINITE DIFFERENCE APPROXIMATION TO THE CONVECTIVE TRANSPORT EQUATION,
Rhode Island Univ., Kingston. Dept. of Ocean Engineering.
R. B. Gordon, and M. L. Spaulding.
In: Symposium On Modeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1220-1236, 1975. 12 fig, 1 tab, 8 ref.

Descriptors: *Model studies, *Water quality, *Path of pollutants, Water pollution, Rivers, Liquid wastes, Pollutants, Convection, Mathematical models, Mathematics, Equations, Analytical techniques, Massachusetts.
Identifiers: Charles River(Mass).

A rapidly converging, implicit finite difference approximation to the steady, one-dimensional convective transport equation has been developed. A mathematical analysis of the dispersive and dissipative characteristics of the finite difference approximatio for the linear case has been conducted, as well as numerical experiments to study accuracy and convergence rate as a function of dispersion coefficient, velocity, and grid spacing. The purpose of this study has been to make available a numerical solution of steady, convective transport problems that will use a minimum of computer time and storage so as to be economical enough to be readily used in water quality studies. Guidelines for the most efficient use of the model were suggested, and the results of an application to the distribution of phosphorous in the Charles River was included. W76-10441

SIMULATION OF THE SALINITY DISTRIBUTION IN THE ST. LAWRENCE ESTUARY BY A TWO-DIMENSIONAL MATHEMATICAL MODEL,
Laval Univ., Quebec. Dept. of Civil Engineering.
Y. Ouellet, and J. Cerceau.
In: Symposium On Nodeling Techniques, Volume II; 2nd Annual Symposium of the Waterways, Harbors and Coastal Engineering Division of ASCE (2 Vol.), San Francisco, California, September 3-5, 1975. American Society of Civil Engineers, New York, p 1249-1269, 1975. 13 fig, 19 ref.

Descriptors: *Model studies, *Estuaries, St. Lawrence River, Mathematical models, *Salinity, Freshwater, Sea water, Temperature, Saline water-freshwater interfaces, Sediments, Erosion, Hydrodynamics, Tides, Water levels, Water circulation.
Identifiers: *St. Lawrence estuary.

The estuary of the St. Lawrence River is a large fluvio-maritime complex extending from the Gulf of St. Lawrence to Montreal. This system is subdivided into the maritime estuary, the lower estuary of a length of approximately 150 miles characterized by great depths (of the order of 1000 ft or more), by a stratification of saline waters and by a width varying from 15 to 30 miles, and the fresh water estuary, the upper estuary of a length of approximately 100 miles where there exist only fresh water tides. In between, the fresh water from upland sources mixes with saline waters from the Atlantic Ocean. This is the region of interest for the present study. The knowledge of the salinity distribution in the estuary is important, considering the flocculation phenomena which are then indirectly related to sedimentation and water quality problerosion patterns with respect to salne and suspension concentrations. These phenomena depend also also on the fresh water inflow and in a cycle way on tides. Two numerical models have been developed, a hydrodynamical model and a transport model, the former serving as support to the latter. It has thus been possible to obtain a better representation of the distribution of salinity concentration and to see the influence of the tide and Coriolis force on the penetration of salt water in the estuary. However, the two-dimensional approach has not made possible the differentiation between superficial fresh water flow and deep salt water flow, a most important aspect in sedimentation mechanisms. ODELLING OF SUSPENSION CURRENTS,
ondheim Univ. (Norway). Vassdrags-og Hav-laboratoriet.
Tesaker.
Symposium on Modeling Techniques, Volume 2nd Annual Symposium of the Waterways, arbors and Coastal Engineering Division of SCE (2 Vol.), San Francisco, California, Sep-nber 3-5, 1975. American Society of Civil En-neers, New York, p 1385-1401, 1975. 7 fig, 9 ref.

scriptors: *Model studies, *Sediment transport, eposition(Sediments), Mathematical models, draulic models, Erosion, Sedimentation, spended solids, Mine wastes, Currents(Water), s, Fluid mechanics, Hydraulics, *Path of pollu-nts.

e transport and deposition of particles by spension currents and jets were discussed. The per described experience with the transfer of sults from ideal laboratory studies to practical ses, and discussed the limitations of physical odelling of suspension currents. Model laws for nsity currents can be used as long as the particle l velocity is small compared to the flow locity. To model the particle motion, Lacey's le for distortion of movable bed models must be lfilled. Field measurements in a suspension cur-nt carrying mine waste have shown that the ex-nal flow mechanics of field and laboratory cur-nts can be directly compared, even if full nilarity is not satisfied. No presently known odel technique can reproduce the internal densi-conditions of a field current with particles finer an sand, because of complex problems involved scaling settling velocity and sediment diffusion. odels can be used to compare alternative solu-ons, however. A study of red mud discharge into ep water was described. A study of the coupling tween fluid and the particles in a horizontal jet as described. Such information is useful for aluation of scale effects due to distortion of par-al diameters in models. The deposition patterns ere compared with observed deposition of ore aste into a lake. hristodoulou, and S. Sundgren.
: Symposium On Modeling Techniques, Volume ; 2nd Annual Symposium of the Waterways, arbors and Coastal Engineering Division of SCE (2 Vol.), San Francisco, California, Sep-mber 3-5, 1975. American Society of Civil En-neers, New York, p 1467-1486, 1975. 11 fig, 9 ref.

escriptors: *Model studies, *Dispersion, *Finite ement analysis, Mathematical models, Circula-on, Water circulation, Bays, Sediments, spended solids, Pollutants, Path of pollutants, assachusetts.
entifiers: *Massachusetts Bay(Mass).

he development of a finite element model to lve the vertically integrated form of the convec-on-diffusion equation was described. The verti-l integration of the governing equation reduces e problem to two dimensions. This limits the odel's predictive capability in problems having gh variation of velocity over depth. However, e greatly reduced storage and computation costs this approach make it a worthwhile alternative a full three-dimensional model. The Galerkin ethod with the linear weighting function was ed in the finite element formulation. Variable epth was included in the arbitrarily shaped solu-on field. Along with the water body geometry, e model inputs required are water velocities, spersion coefficients and decay factors at vari-us points in the solution field. These values may e given as constants or as functions of space and me. The model was verified by comparison with several analytical solutions. The model was then applied to the dispersion of suspended sediments in Massachusetts Bay. A recently developed finite element circulation model was employed to generate velocities for the model. Certain stability problems that occasionally arise with the use of the model were discussed and techniques to avoid such problems were presented. (See also W76-10415) (Sims-ISWS)

EXCHANGE FLOW BETWEEN LAKE ONTARIO AND HAMILTON HARBOUR,
Canada Centre for Inland Waters,Burlington (Ontario).
T. M. Dick, and J. Marsalek.
Canada Centre for Inland Waters, Scientific Series No. 36, 1973, 22 p. 9 fig., 14 ref., 6 tab.

Descriptors: *Mixing, *Lake Ontario, Water level fluctuations, Density, Currents, Landfills, Operations, Water quality, *Canada, Industrial wastes, Lakes, Flow characteristics, Water pollution sources, *Path of pollutants.
Identifiers: *Hamilton Harbour(Ontario), Burlington Canal(Ontario), Industrial pollution, *Exchange flow(Lakes).

A hydraulic study of the exchange flow between Hamilton Harbour and Lake Ontario reveals the necessity to consider short term transitory water level fluctuations to estimate mass exchange. Field studies identified the development of a strong thermal wedge and density current which increases the mass exchange. Data on the thermal wedge were used to examine the two dimensional wedge theory. Some calculations were also done on the effect of harbour land filling on the mass exchange. (Environment Canada)

BIOLOGICAL SURVEY OF THE SAVANNAH RIVER IN THE VICINITY OF THE SAVANNAH RIVER PROJECT. PART I - REPORT ON THE WORK DONE AND TENTATIVE CONCLUSIONS ON THE SUMMER SURVEY,
Academy of Natural Sciences of Philadelphia, Pa. Dept. of Limnology.
J. E. Cole, R. R. Palmer, R. Patrick, and T. Dolan.
Available from the National Technical Information Service, Springfield, Va 22161 as TID-26669-P1, $4.00 in paper copy, $2.25 in microfiche. Report ACADOF-51-VSR, Pt. I, September 24, 1951. 28 p, 1 tab.

Descriptors: *South Carolina, Surface waters, *Sewage, *Water pollution, Flora, Aquatic fauna, *Aquatic microorganisms, *Biochemical oxygen demand, *Coliforms, *Georgia, Domestic wastes, Water pollution sources, Aquatic bacteria, On-the-site survey, Microbiology.
Identifiers: *Savannah River(SC-Geo), Upper Three Run, Augusta(Geo).

The Savannah River is a normal river of low biological productivity. This limited life is due to physical circumstances causing unfavorable ecological conditions rather than pollution. The only noticeable effects of pollution resulting from the Augusta sewage are the very high bacteria and coliform counts. Upper Three Run also shows a similar condition, which is probably due to the trailer camp and swimming area which is located at and just above the station. (See also W76-10042 and W76-10043) (Katz)

Available from the National Technical Information Service, Springfield, Va 22161 as TID-26669-P2, $4.00 in paper copy, $2.25 in microfiche. Report ACADOF-51-VSR, Pt II, (1952). 46 p, 15 fig, 1 tab.

Descriptors: *Georgia, *South Carolina, *Ecology, *Primary productivity, Aquatic productivity, *Water quality, *Coliforms, Stream, Natural stream, On-the-site survey, Food chain, Water temperature, Aquatic microorganisms, Biochemical oxygen demand.
Identifiers: *Savannah River(SC-Geo), Stream survey, Upper Three Run.

The Savannah River in the vicinity of the Savannah River Project as measured by its diversity of species is a healthy natural river. Certain adverse ecological factors limit its productivity, but it has a well balanced biodynamic cycle. The results of the fall survey substantiate for the most part the conclusion of the summer survey. The main deviation is that for some groups it seems more productive than thought at first. Upper Three Run is also a natural stream with a well balanced pattern of life. (See also W76-10041 and W76-10043) (Katz)

Available from the National Technical Information Service, Springfield, Va 22161 as TID-26669-P3, $4.50 in paper copy, $2.25 in microfiche. Report ACADOF-51-VSR (Pt. III), April, 1952. 60 p, 1 tab, 25 fig.

Descriptors: *Stream, *Surveys, *Freshwater fish, Aquatic plants, Aquatic insects, *Aquatic life, *Coliforms, *Georgia, Ecology, Primary productivity, Biochemical oxygen demand, Natural stream, Water quality, *South Carolina.
Identifiers: *Savannah River(SC-Geo).

The Savannah River was studied during the third survey under winter conditions. The total amount of aquatic life was probably much the same for most groups at this time as during the time of the previous surveys. High water and the resulting ecological conditions caused a decrease in the numbers of organisms collected and the apparent population was less. There had been an apparent

seasonal change in species in most of the groups. However, in the case of the insects and fish this was more apparent than real, for during the previous surveys the organisms had been too small to be readily collected. Among the algae there had been an actual change in the common species. The number of species in the various groups remained quite comparable. According to the method used for measuring the health of a river, all stations continued to be rated as 'healthy'. (See also W76-10041 and W76-10042) (Katz)
W76-10043

SAVANNAH RIVER BIOLOGICAL SURVEY, SOUTH CAROLINA AND GEORGIA, AUGUST, 1954.
Academy of Natural Sciences of Philadelphia, Pa. Dept. of Limnology.
May, 1955. 63 p, 3 fig, 1 tab, 4 ref.

Descriptors: *South Carolina, *Georgia, *Surveys, *Freshwater fish, *Sediments, Natural stream, *Water quality, *Diatoms, *Aquatic plants, *Aquatic animals, Aquatic insects, Water quality, Protozoa.
Identifiers: Aquatic protozoa, Savannah River(SC-Geo).

A survey of two stations in the Savannah River in the vicinity of the Savannah River Plant of the Atomic Energy Commission was made. The purpose was to determine the effects on aquatic life of the functioning of Clark Hill Dam. This investigation was made at the end of August, 1954. The study indicated a considerable increase of life in the river both as to numbers of species and size of populations. This increase was especially notable as compared with the summer survey made in 1951. Only in the invertebrate fauna was there no conspicuous change in total populations. The operation of the dam has reduced the silt load and stabilized the water flow. Clearer water has deepened the photosynthetic zone. The resultant greatly increased growth of plants is furnishing more food for animals. The more stable water level has enabled many of the shallower-water areas to be occupied continuously by a variety of organisms. The banks of the river, which had been continually eroding, have become more stabilized. No deleterious effects from the operation of the Savannah River Projects were observed. At the stations studied the Savannah River is classified as 'healthy'. (Katz)

EFFECTS OF LARGE SCALE FOREST FIRES ON WATER QUALITY IN INTERIOR ALASKA,
National Environmental Research Center, College, Alaska. Arctic Environmental Research Lab.
F. B. Lotspeich, E. W. Mueller, and P. J. Frey.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-241 922, $5.50 in paper copy, $2.25 in microfiche. Report EPA-660/3-75-020, February, 1970. 116 p, 18 tab, 13 fig.

Descriptors: *Water quality, *Alaska, *Sediments, Aquatic environment, *Degradation(Stream), *Forest fires, *Erosion control, Water chemistry, Sediment discharge, Sediment load, Water quality, Forests, Soils, Aquatic insects, Benthos, On-the-site survey.
Identifiers: Erosion protection, Interior Alaska, Soil saturation, *Taiga(Alas), Lightning fires.

Large and frequent fires are not new to the Taiga of Alaska, nor is Alaska unique among northern regions in this respect. Interior Alaska was very dry in the summer of 1966 and thunderstorms were frequent. The fire, on which this report is based, was caused by lightning on July 23, 1966, and burned into September covering a total of over 1/4 million acres. The objectives of this study were: to develop sufficient understanding of the effects of forest fires on water quality of Alaskan streams so that it may be possible to make rational decisions for allocating manpower and funds for controlling specific fires and to develop an understanding of needs for rehabilitation (revegetation, erosion prevention, etc.) to control immediate and future polluting effects of the fire on the aquatic environment. CHEMICAL IMPACT OF SNOW DUMPING PRACTICES,
Little (Arthur D.), Inc., Cambridge, Mass.
P. J. O'Brien, P. L. Levins, and C. H. Summers.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-238 764, $4.00 in paper copy, $2.25 in microfiche. Report EPA-670/2-74-086, December 1974, 39 p, 11 tab, 15 fig, 3 ref.

Descriptors: *Calcium chloride, *Chlorides, Surface waters, Runoff, *Snow removal, Snow, *Melt water, Water quality, *Lead, Water supply, Snow management, Roads, Snow melt, Nitrates, Phosphates, Chromium, Iron, New York, Massachusetts.
Identifiers: *Mohawk River(NY), *Concord River(Mass), Highway deicing chemicals.

A study was conducted to evaluate the chemical effects of dumping of snow collected from the municipal streets into watercourses or waterbodies in three selected areas: a large river (Mohawk at Schenectady, N. Y.), a smaller river (Concord at Lowell, Mass), and a small pond (Horn at Woburn, Mass.). Unusually low snowfall during the winters of 1972-73 and 1973-74 together with a nationwide gasoline shortage (which limited or curtailed snow dumping operations) resulted in insufficient data. The following conclusions are, therefore, based on limited observations and tests: 1. Little effect of snow dumping was observed in the downstream concentration of any species examined. 2. Increased chemical concentrations observed during the late summer low-flow period were as great as any effect related to salt use examined in this study. 3. The maximum possible increase in concentration of chloride was calculated to be no more than 0.04 mg/l in the waterbody of lowest dilution volume (Horn Pond). This concentration is less than precision of the assay technique used. (Katz)

AN ANALYSIS OF THE DYNAMICS OF DDT AND ITS DERIVATIVES, DDD AND DDE, IN MARINE SEDIMENTS
Stanford Univ., Pacific Grove, Calif. Hopkins Marine Station.
J. H. Phillips, E. E. Haderlie, and W. L. Lee.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-238 511, $5.50 in paper copy, $2.25 in microfiche. Report EPA-660/3-75-013, May 1974, 97 p., 24 tab., 6 fig., 11 ref.

Descriptors: *DDT, *DDE, *DDD, Pesticides, Laboratory analysis, Bays, Statistical methods, *Pesticide kinetics, *California, Pacific Ocean, Microorganism, *Sediments, Aquatic soils, Bottom sediments, Methodology, Sampling, *Chlorinated hydrocarbon pesticides, Pollutant identification.
Identifiers: *Monterey Bay(Calif).

Concentrations of the three chlorinated hydrocarbons, DDT, DDD, and DDE, were measured in sediments at 57 stations in Monterey Bay on the Central California coast during 1970 and 1971. Mean concentration in parts per billion was DDT 3.1, DDD 2.3, and DDE 5.4. Maximum concentrations were DDT 19.3, DDD 8.7, DDE, 20.5 parts per billion. The distribution of the three compounds within South Monterey Bay was charted. During 1973 nineteen of the original stations, representing locations that had low intermediate, and high concentration in the original survey, were resampled. The mean concentrations approximately three years later were DDT 15.5, DDD 2.3, and DDE 5.4 parts per billion with maximum levels of DDT 83.1, DDD 11.4 and DDE 17.5 parts per billion. A chart of the concentrations in South Monterey Bay revealed essentially the same distribution of chlorinated hydrocarbons. Laboratory assays were developed to determine the relative rate of decomposition in sediment placed under conditions selective for various physiologically different kinds of microorganisms. 14-C ring labelled substrates wer used in all assays. Decay of the three chlorinated hydrocarbons under aerobic conditions without additional nutrients was greater than decay under anaerobic conditions. (Katz)

A REVIEW OF THE LITERATURE ON THE USE OF SIMAZINE IN FISHERIES,
Fish and Wildlife Service, LaCrosse, Wis. Fish Pesticide Research Unit.
W. L. Mauck.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-235 455, $4.50 in paper copy, $2.25 in microfiche. Report No. FWS-LR-74-16, March, 1974. 46 p., 2 tab., 78 ref.

Descriptors: *Toxicity, *Marsh management, *Reviews, *Bibliographies, *Biocides, Freshwater fish, Habitat improvement, Wildlife habitat, *Herbicides, Fish establishment, Fish farming, Aquatic fauna, Aquatic plants, Aquiculture, Water pollution effects.
Identifiers: *Simazine, Aquatic herbicides, Literature reviews.

LIBRARY U. OF I. URBANA-CHAMP.

Simazine is a systemic herbicide that has been registered and used for many years for weed control in crops and industrial areas. In recent years, the use of simazine as an aquatic herbicide has been extensively investigated. Simazine was found to be efficaceous, to have relatively low toxicity to aquatic fauna, and to be residual, but it did not accumulate in non-target organisms. Most of the required information for simazine registration as an aquatic herbicide has been acquired. Additional data for registration are needed in the areas of fish and water tolerances. Registration could be completed by late 1974 or early 1975 according to Ciba-Geigy Chemical Corporation. (Katz)

BIODEGRADABILITY AND TOXICITY STUDIES OF PHOTOGRAPHIC PROCESSING WASTES AT OFFUTT AFB, NEBRASKA,
Environmental Health Lab., Kelly AFB, Tex.
J. F. Thomas, and E. E. Lefebvre.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-784 786, $4.00 in paper copy, $2.25 in microfiche. EHL(K) 74-16, July, 1974, 31 p., 9 tab., 4 fig., 9 ref.

Descriptors: *Toxicity, *Bioassays, *Minnows, *Silver, *Biochemical oxygen demand, *Sludge digestion, *Chemical oxygen demand, Laboratory studies, *Biodegradation, Metahodology, Sewage treatment Oxygen, Nebraska, Water pollution effects.
Identifiers: *Fathead minnow, Pimephales promelas, *Photographic processing wastes, Offutt AFB(Neb), Respirometer, Warburg.

Biodegradation and toxicity studies were completed for photographic processing wastewaters generated by the 544th Aerospace Reconnaissance Technical Wing (SAC) Photo Plant at Offutt AFB, Nebraska. Two sets of samples were collected from the generated wastewaters, one in March and the other in September 1972. Composite samples were prepared from each of the sets and evaluated for biodegradability and toxicity. The toxicity studies were performed by using Pimephales promelas (Fathead Minnow) as test animals and the effluent from a bench-scale activated sludge plant treating the composite photowaste samples. The toxicity of the photowaste composite prepared from the March set of samples was approximately 20 times that of the composite prepared from the September set of samples after treatment. The biodegradation and toxicity potentials of photo processing wastewaters will be dependent upon the type of processing, quantity of processing, silver recovery, reprocessing and recycling of the generated wastes prior to entering the biodegradation system. (Katz)

Available from the National Technical Information Service, Springfield, Va 22161 as PB-238 930 $5.00 in paper copy $2.25 in microfiche. October, 1971. 74 p., 27 tab., 13 fig.

Descriptors: *Water quality, *Navada, Surface waters, *Irrigation design, *Waste water disposal, *Phosphates, *Water temperature, *Eutrophication, Lake Basin, Irrigation, Water management(Applied), Land development, Water rights, Irrigation practices, Benthic organisms.
Identifiers: Truckee River(Nev), Carson River(Nev), Pyramid Lake(Nev), Lahontan Reservoir(Nev).

Recommendation are made for operating criteria and procedures that would maximize the use of flows required to meet the water entitlement of the Truckee-Carson Irrigation District (TCID) and to minimize diversion of the Truckee River so that as much water as possible could be provided to Pyramid Lake. Developing such recommendations involved maing economic, population, and waste load projections; predicting the effects of planned development projects and proposed management plans, and determining water needs within the river basins. CONSIDERATIONS ON THE EFFECTS OF HIGH TEMPERATURES ON ALGAE AND FISHES, A LITERATURE REVIEW, 1954,
Academy of Natural Sciences of Philadelphia, Pa. Dept. of Limnology.
E. L. Verplanck, N. M. Wallace, and J. Cairns, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as TID 26670 $5.00 in paper copy, $2.25 in microfiche. May, 1954. 82 p., 7 tab., 212 ref.

Descriptors: *Review, *Bibliographies, *Thermal pollution, Water pollution effects, *Nuclear power plants, Temperature, Environmental effects, Laboratory analysis, Freshwater fish, Algae, *Water temperature, Electric power, Diatoms, *Lethal limit, Georgia, South Carolina.
Identifiers: *Savannah River(SC-Geo), Upper-lethal temperature, Acclimation, Literature reviews.

This review of the literature demonstrates that prolonged and uniform heating of a body of water to 33 to 55C would be deleterious to the fish and algae characteristic of southern temperate rivers such as the Savannah. However, if certain areas of the river could be maintained below this temperature the fishes could retreat to such areas provided the oxygen content and other environmental characteristics were suitable. Likewise, if certain chregions in shallow water could be maintained with temperatues of 30C or lower a diversified algal flora would survive in such areas. (Katz)

PRELIMINARY ENVIRONMENTAL SURVEY, NEWPORT ARMY AMMUNITION PLANT, NEWPORT, INDIANA, JANUARY, 1973,
Edgewood Arsenal, Aberdeen Proving Ground, Md. Biomedical Lab.
J. G. Pearson, D. A. Stiles, E. S. Bender, and J. S. Gibson.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A001 537, $3.50 in paper copy, $2.25 in microfiche. Special Publication, EB-SP-74010, October, 1974. 67 p, 14 fig, 68 ref.

Descriptors: Environment, Aquatic environment, Terrestrial habitats, *Wildlife habitats, Chemical industries, Mammals, Birds, Freshwater fish, Environmental control, Balance of nature, Habitats, Industries, *Indiana, Reptiles, Amphibians, Invertebrates, Wildlife, *Chemical wastes, Surveys.
Identifiers: Newport Army Ammunition Plant(Ind), *Ammunition industry wastes, Vermilion County(Ind), Woodlands, Rare species, Endangered species.

The information compiled was used to design and interpret results from an ecological survey initiated at Newport Army Ammunition Plant, Newport, Indiana in November 1972 to biologically assess the effects of installation operation. This report contains background information on the nature of Newport Army Ammunition Plant and the surrounding county, the natural resources at the installation, and actual or potential environmental impact on these resources from operations at Newport Army Ammunition Plant. ZINC PHOSPHATE GRANULES IN TISSUE SURROUNDING THE MIDGUT OF THE BARNACLE BALANUS BALANOIDES,
Natural Environment Research Council, Anglesey (Wales). Unit of Marine Invertebrate Biology; and University Coll. of North Wales, Menai Bridge. Marine Science Labs.
G. Walker, P. S. Rainbow, P. Foster, and D. L. Holland.
Marine Biology, Vol. 33, No. 2, p. 161-166, 1975. 1 fig., 2 tab., 21 ref.

Descriptors: Inorganic Compounds, *Phosphates, *Crustaceans, Animal physiology, Zinc, *Cytological studies, *X-ray analysis, Metals, *Absorption, *Chemical analysis, Analytical techniques, Magnesium, Calcium, Potassium, Iron, Invertebrates, Methodology, Spectrophotometry, Electron microscopy, Environmental effects, Trace elements, *Pollutant identification.
Identifiers: Balanus balanoides, Bioaccumulation, *Barnacles, *Tissue analysis, *Zinc phosphate.

The chemical composition of inorganic granules found in parenchyma cells surrounding the midgut of adult Balanus balanoides (L.) was determined. X-ray microanalysis indicated the presence of magnesium, phosphorous, potassium, calcium, iron and zinc in the granules. A quantitative analysis of granule-rich pellets isolated from the midguts of adult barnacles showed that the granules were composed mainly of zinc phosphate, the remaining elements being minor constituents only. SOME ASPECTS OF RECOLONIZATION OF CORAL ROCKS IN EILAT (GULF OF AQABA) BY FISH POPULATIONS AFTER POISONING,
Tel-Aviv Univ., (Israel). Dept. of Zoology.
N. Gundermann, and D. Popper.
Marine Biology, Vol. 33, No. 2, p. 109-118, 1975. 1 tab., 6 fig., 13 ref.

Descriptors: *Fishkill, *Poisons, *Toxicants, Coral, Fish populations, Water pollution effects, *Pesticides, Aquatic habitats, *Juvenile fish, *Food webs, *Benthos, Tropical regions, Aquatic environments, Fish behavior, Algae, Endrin, *Chemical wastes, Growth rates, Reefs.
Identifiers: Recolonization, Tropical fish, *Coral fish, Damsel fish, Barracuda, Lion fish, Scaridae, Labridae, Sparidae, Ciandrin, Ariosal, Kavion, *Red Sea.

As a result of an accident, a limited strip of the coast of Eilat (Gulf of Aqaba, Red-Sea) was affected by pesticides and chemicals that killed all fishes. The area was observed monthly for the following year, to study the recovery of fish populations. The study also included observations on growth rate of fish and size populations. Recovery of fish populations was complete 10 to 12 months after the poisoning. It is believed that this is due to the relatively small size of the contaminated area and the survival of most invertebrates that constitute an important part of the biotope of the fish. (Katz)
W76-10058

EFFECT OF TEMPERATURE AND TEMPERATURE ADAPTATION ON CALCIFICATION RATE IN THE HERMATYPIC CORAL POCILLOPORA DAMICORNIS,
Loma Linda Univ., Calif. Dept. of Biology.
C. D. Clausen, and A. A. Roth.
Marine Biology, Vol. 33, No. 2, p. 93-100, 1975. 3 fig., 4 tab., 17 ref.

Descriptors: Environmental effects, Animal physiology, *Radioisotopes, Coral, Reefs, Temperature, *Calcium, Analytical techniques, *Growth rates, *Adaptation, Calcium compounds, Marking techniques, Tracers, Aquatic animals, Benthic fauna, Laboratory tests, Calcium car-

bonate, Invertebrates, Animal growth, *Water temperature, *Thermal pollution, Pollutant identification, Water pollution effects.
Identifiers: *Pocillopora sp., *Calcification rate.

Using 45Ca incorporation into the coral skeleton as a measure of calcification rate, the effect of temperature on calcification rate was studied in the hermatypic coral Pocillopora damicornis. Both immediate and longterm (adaptation) effects were investigated. Temperature has a marked effect on rate - an effect that varies depending on the temperature history of the coral (i.e., temperature adaptation occurs). P. damicornis showed both 27 and 31 C temperature optima, one or the other being dominant depending on the natural water temperature to which the coral was adapted. The two optimum temperatures may indicate two isoenzymes or two alternate metabolic pathways involved in the calcification process. (Katz)

PHOTOSYNTHETIC STUDIES OF CHONDRUS CRISPUS,
New Hampshire Univ., Durham. Dept. of Botany.
A. C. Mathieson, and T. L. Norall.
Marine Biology, vol. 33, No. 3, p. 208-213, 1975. 2 fig., 20 ref.

Descriptors: Plant physiology, *Photosynthesis, Temperature, Genetics, *Seasonal, *Light, Environmental effects, *Respiration, *Spatial distribution, *Intertidal areas. *Adaptation, Energy conversion, Primary productivity, Laboratory tests, Carbon cycle, Plant breeding, Summer, Reproduction, Aquatic plants.
Identifiers: Net photosynthesis, *Chondrus crispus, Irish moss.

The net photosynthesis of intertidal, subtidal, carposporic, tetrasporic, and winter versus summer acclimatized plants of Chondrus crispus were evaluated under different temperatures and quantities of light. The optimum temperature and light conditions for net photosynthesis are seasonally and spatially variable, and there is an adaptive shift in the photosynthetic capacity at different seasons and positions on the shore. Plants collected during the fall and winter had lower light optima (465 to 747 ft-c) for net photosynthesis than spring and summer specimens (about 1000 ft-c). Intertidal populations exhibited a higher rate of net photosynthesis between 250 and 2819 ft-c than subtidal plants. Temperature tolerance was greater in summer plants and shallow subtidal plants, than in winter plants and deep subtidal plants. Tetrasponic plants (diploid) showed a higher rate of net photosynthesis than carposporic plants (haploid) and may extend deeper in the subtidal zone because of this. (Katz)

ULTRASTRUCTURAL CHANGES IN THE HEPATOCYTES OF GREEN SUNFISH, LEPOMIS CYANELLUS RAFINESQUE, EXPOSED TO SOLUTIONS OF SODIUM ARSENATE,
Texas Univ. at Austin. Dept. of Zoology.
E. M. B. Sorensen.
Journal of Fish Biology, Vol. 8, No. 3, p. 229-240, 1976. 8 fig., 1 tab., 37 ref.

Descriptors: *Sunfishes, *Bioassay, Laboratory tests, *Arsenic compounds, *Absorption, *Cytological studies, Morphology, *Toxicity, Water pollution effects, Pathology, Fish physiology, Methodology, Analytical techniques, Electron microscopy, *Fish diseases, *Pollutant identification.
Identifiers: Lepomis cyanellus, Bioaccumulation, Hepatocytes, Liver, Sublethal effects, *Sodium arsenate.

The rate and level of arsenic accumulation in the liver of green sunfish is greater than that in the other organs examined. The level to which arsenic is concentrated is positively associated with the concentration of arsenic in solution in the immediate environment of a fish, the duration of exposure to arsenic, and water temperature. Since it was found that accumulation causes histopathological changes, a study was made to examine the appearance of and rate of change in hepatocyte ultrastructure morphology, following exposure to arsenic concentrations of 0, 30, or 60 ppm and after exposure times of one, two, or three weeks at 20 C. As arsenic concentration and exposure time increased, electron dense particles were observed, and the numbers of intranuclear and cytoplasmic electron dense particles and aberrant mitochondria increased. Also, lysosomes and smooth endoplasmic reticulum increased in number, while the number of myelin figures decreased. (Katz)
W76-10062

INFLUENCE OF TEMPERATURE AND SALINITY ON ROUTINE METABOLIC RATE AND GROWTH OF YOUNG ATLANTIC MENHADEN,
National Marine Fisheries Service, Beaufort, N. C. Atlantic Estuarine Fisheries Center.
W. F. Hettler.
Journal of Fish Biology, Vol. 8, No. 1, p. 55-65, 1976. 7 fig., 4 tab., 21 ref.

Descriptors: *Salinity, *Temperature, *Growth rates, Environmental effects, Laboratory tests, *Juvenile fish, *Fish behavior, *Metabolism, Respiration, Analytical techniques, Saline water fish, Estuaries, Juvenile growth stage, Larvae, Aquatic environment, Feeding rates, Water pollution effects.
Identifiers: *Menhaden, Sublethal effects.

Factors affecting the metabolic rate of schooling juvenile menhaden were examined. Temperature had little effect on routine metabolic rates of juveniles. Variations in salinity affected metabolic rate with a possible indication that metabolic rate is lowest at intermediate salinities. The metabolic cost of maintaining water balance and ion exchange may account for the increased oxygen consumption at high and low salinities. Feeding caused a twofold increase in metabolic rate due in part to rapid swimming during the feeding period. Starvation resulted in a decreased metabolic rate. Larvae raised at high salinity (28-34 ppt) were found to grow at a significantly slower rate than menhaden larvae raised at low salinity (5-10 ppt). Results may be due to differences in activity and additional replications are necessary. (Katz)

IRRADIANCE REDUCTION: EFFECTS ON STANDING CROPS OF THE EELGRASS, ZOSTERA MARINA IN A COASTAL LAGOON,
San Diego State Univ., Calif. Dept. of Botany.
T. W. Backman, and D. C. Barilotti.
Marine Biology, Vol. 34, No. 1, p 33-40, 1976. 6 fig., 3 tab., 26 ref.

Descriptors: *Environmental effects, *Plant growth, *Growth rates, *Light intensity, *Productivity, *Light penetration, *Lagoons, *Marine plants, *On-Site investigations, Shallow water, Standing crops, Primary productivity, Population, Methodology, Biomass, Seasonal.
Identifiers: *Zostera sp., *Eelgrass, *Shade, *Irradiance.

Abundance of the eelgrass Zostera marina was studied in a coastal lagoon in southern California and was found to correlate with the level of irradiance at depths greater than 0.5 m below tidal datum. Results of controlled field experiments, using canopies to reduce downwelling illuminance by 63%, confirmed that turion density is a function of the irradiance the plants receive. By Day 18 of the experiment, turion density in the shaded experimental areas had decreased compared to the density of unshaded controls. Flowering in the experimenal areas was also inhibited by shading. The biological implications are discussed in terms of seasonal changes and man's intervention in the natural process of coastal lagoons. (Katz)

PETROLEUM HYDROCARBONS: DEGRADATION AND GROWTH POTENTIAL FOR ATLANTIC OCEAN SEDIMENT BACTERIA,
Maryland Univ., College Park. Dept. of Microbiology.
J. D. Walker, J. J. Calomiris, T. L. Herbert, and R. R. Colwell.
Marine Biology, Vol. 34, No. 1, p 1-9, 1976. 4 fig., 6 tab., 20 ref.

Descriptors: *Biodegradation, *Growth rates, Aquatic bacteria, Organic compounds, *Sediments, *Bacteria, *Degradation(Decomposition), *Pseudomonas, Nutrient requirements, Sampling, Laboratory test, Analytical techniques, Microorganisms, Environmental effects, Marine bacteria, Methodology, *Oil pollution, Water pollution effects, Atlantic Ocean.
Identifiers: *Petroleum Hydrocarbons.

Water, sediment, and microorganisms were sampled at stations along a trackline in the Atlantic Ocean off the North Carolina Coast at depth of 9 to 5,000 m. Selected chemical and physical parameters were measured. At three of the stations, microorganisms isolated from sediment were examined for ability to degrade a number of petroleum hydrocarbons. Media made up with seawater or salts solution supplemented nitrate and phosphate were employed in the degradation study; significant growth and hydrocarbon degradation was observed. Bacteria from sediment

amples collected at a depth of 5,000 m showed greater growth and and hydrocarbon degradation when cultured in a sea-water medium than in nedia made up with salts solution. Growth of bacteria in sediment samples collected at two stations vas found to be suppressed in seawater medium vhen a 1% (v/v) mixture of 19 different petroleum ıydrocarbons was added. The hydrocarbon mixure was useful in determining the hydrocarbons legrading potential of microorganisms isolated rom the ocean environment. (Katz)

ASPECTS OF PHYSIOLOGICAL CONDITION N MYTILUS EDULIS L., WITH SPECIAL REFERENCE TO THE EFFECTS OF OXYGEN TENSION AND SALINITY,
nstitute for Marine Environmental Research, Plymouth (England).
. L. Bayne.
n: Proceedings, 9th European Marine Biology Symposium, H. Barnes, ed, Aberdeen University Press, p. 213-238, 1975. 2 tab., 12 fig., 60 ref.

Descriptors: * Salinity, *Dissolved oxygen, Amino acids, Stress, Animal physiology, Environmental effects, Adaptation, *Mussels, Temperature, *Feeding rates, Compensation, Reviews, Invertebrtes, Laboratory tests, Nitrogen, Crustaceans, Marine animals.
Identifiers: Mytilus edulis, Sublethal effects.

A definition of stress, as applied to marine bivalves, is offered. Experiments on the physiological responses of Mytilus edulis to reduced oxygen tension and reduced salinity are described. Mechanisms of compensation for reduced oxygen tension include a reduction in the ventilation relative perfusion ratio and an increase n the extraction efficiency for oxygen; these rocesses result in complete acclimation of the ate of oxygen consumption at an oxygen tension f 80 mm Hg, and partial acclimation at 40 mm Hg. Compensation for reduced salinity involves increased rates of excretion of ammonia, loss of certain amino acids, and a decline in the concentraon of free amino acids in the mantle tissue consistent with previous studies of volume regulation. The physiological condition of the animal may be ssessed in terms of simple, integrated physiologial measurements, such as the 'scope for growth' nd the 'O:N ratio.' Linked to measurements of ne degree of 'disadvantage' the results of a stress ondition, they may be used to further understand ne ecology of the species. (Katz)
V76-10070

THE IMPORTANCE OF DISSOLVED ORGANIC COMPOUNDS IN SEA WATER FOR THE NUTRITION OF ANEMONIA SULCATA PENANT (COELENTERATA),
Cologne Univ. (West Germany). Zoological Institut.
. Schlichter.
n: Proceedings 9th European Marine Biology ymposium, H. Barnes, ed. Aberdeen University ress, p. 395-406, 1975. 10 fig., 21 ref.

Descriptors: *Nutrients, *Cytological studies, Nutrient removal, *Nutrition, Tracers, Animal hysiology, Temperature, *Animal metabolism, Absorption, *Organic compounds, *Amino acids, Carbohydrates energy, Biological membranes, Mode of action, Analytical techniques, Methodology, Laboratory tests, Pollutant identification, Water pollution effects.
Identifiers: *Anemonia sp., Bioaccumulation, Dissolved organic compounds.

Anemonia sulcata absorbs and accumulates tritiated L-amino acids and D-glucose dissolved in artificial sea water in their natural concentrations. Absorption occurs through the apical membrane of the ectoderm due to cytological structures. The cells can concentrate the free organic compounds by a factor of 106 the concentration found in the medium. Absorption is affected by temperature and inhibitors and uptake is dependent on energy available. Naturally occurring changes in abiotic environmental factors do not adversely influence the capacity to take up organic compounds. Glucose does not influence the uptake of amino acids while the amino acids can interfere with each other. This suggests absorption by different 'carrier systems.' Calculations show that actinians satisfy a substantial portion of their metabolic requirement by absorbing dissolved organic material from the environment. (Katz)
W76-10071

ON THE RELATIONSHIP BETWEEN OXYGEN CONSUMPTION AND FEEDING LEVEL IN DECAPODS,
London Univ. (England). Dept. of Zoology and Comparative Physiology.
J. C. Aldrich.
In: Proceedings 9th European Marine Biology Symposium, H. Barnes, ed. Aberdeen University Press, p. 407-418, 1975. 3 fig., 25 ref.

Descriptors: *Respiration, *Oxygen requirements, *Animal physiology, *Metabolism, *Feeding rates, Size, Laboratory tests, *Crustaceans, *Crabs, Animal behavior, Temperature, Invertebrates, Energy conversion, Biorhythms, Diurnal.
Identifiers: *Hepatopancreas, Libinia sp., Carcinus sp., Cancer sp., Decapods.

Feeding level has been shown to affect the rate of oxygen consumption in some decapods, namely, an oxyrhynchous crab, Libinia emarginata, and two brachyrhynchous crabs, Cancer pagurus and Carcinus maenus. The size of the hepatopancreas suggests the relative rate of energy flow, a relationship apparently paralleled by the rate of food consumption. On a population basis, the average maximum rate of oxygen consumption appears to indicate the average level of feeding. On an individual basis, the analysis is complicated by great variability with a 3-5 times range of oxygen consumption rate in non-motile crabs kept at constant temperature, both fed and starved. An attempt has been made to distinguish between effects attributable to single meals and excitement and those due to hepatopancreas size and nutritive levels. The possibility of correlating individual oxygen consumption rates and nutritive levels is discussed. (Katz)

AUTUMN MIGRATION AND VERTICAL DISTRIBUTION OF THE BROWN SHRIMP CRANGON CRANGON L. IN RELATION TO ENVIRONMENTAL CONDITIONS,
Rijsinstituut voor Visserijonderzoek, Ymuiden (Netherlands).
R. Boddeke.
In: Proceedings 9th European Marine Biology Symposium, H. Barnes, ed. Aberdeen University Press, p. 483-494, 1975. 10 fig, 12 ref.

Descriptors: *Shrimp, *Reproduction, Seasonal, *Temperature, On-site investigation, Environmental effects, *Autumn, Migration, *Migration patterns, Sexual maturity, *Mature growth stage, *Immature growth stage, *Salinity, Tidal waters, Shellfish, Animal behavior, *Spatial distribution, Temporal distribution, Life cycles, Movement, Population.
Identifiers: Crangon crangon, *Brown shrimp.

The causes of the autumnal migration of the brown shrimp are induced by fluctuations of the water temperature, especially those in the tidal zone, caused by seasonal differences between air and water temperatures. Sexually mature shrimps are more sensitive to temperature fluctuations than sexually less mature shrimp. The autumn migration parallels a period of increasing sexual activity and appears to be a regular process in which waves of shrimps in decreasing stages of sexual ripeness migrate to the open sea one after another. By this rigid patterned process of migration the density of the inshore population is reduced in a regular way, leaving the sexually least mature animals in the areas with the richest food supplies and returning the sexually more mature animals to more or less the same area where they hatched. (Katz)
W76-10073

DIFFERENCES IN LOW PH TOLERANCE AMONG STRAINS OF BROOK TROUT (SALVELINUS FONTINALIS),
Pennsylvania State Univ., University Park. Dept. of Biology.
G. D. Robinson, W. A. Dunson, J. E. Wright, and G. E. Mamolito.
Journal of Fish Biology, Vol. 8, No. 1, p. 5-17, 1976. 2 tab., 5 fig., 24 ref.

Descriptors: *Hydrogen ion concentration, *Acidic water, *Bioassay, *Brook trout, *Temperature, Size, *Fish genetics, Resistance, *Mortality, Acidity, Water quality, Environmental effects, Laboratory tests, Fish physiology, Salmonids, Genetics, Breeding, Water pollution effects, Seasonal.
Identifiers: Salvelinus fontinalis.

Survival time of brook trout (Salvelinus fontinalis) at low pH was directly related to size, and inversely related to temperature. Between pH 2.50 and 3.25 each increase in pH by increments of 0.25 led to a 2-3 fold increase in survival time. At higher pH's (3.25-3.75) elevations in pH by the same increments produced a 3-5 fold increase. Members of seven inbred lines of brook trout were tested for acid tolerance; the lines differed markedly providing strong evidence that acid tolerance is hereditary. Differences in survival of inbred lines were the most marked at pH 3.25. Exposure for 1 week at pH 3.75 resulted in a 20-25% decrease in survival time of 18 fish tested at pH 2.50 and 3.00. Out of a total of 24 trout tested at pH 3.75, two highly tolerant individuals were still alive after 6.1 weeks. Thus it is likely that a strain resistant to a pH below 4.1, the previously recorded lower limit, can be developed by selective breeding. (Katz)
W76-10074

TOXICITY OF POLYCHLORINATED BIPHENYLS (AROCLOR 1254) TO ADULT, JUVENILE AND LARVAL STAGES OF THE SHRIMP PALAEMONETES PUGIO,
Texas A and M Univ., College Station. Dept. of Biology.
G. Roesijadi, S. R. Petrocelli, J. W. Anderson, C. S. Giam, and G. E. Neff.
Bulletin of Environmental Contamination and Toxicology, Vol. 15, No. 3, p. 297-304, 1976. 1 fig., 3 tab., 16 ref.

Descriptors: *Polychlorinated biphenyls, *Aroclor, *Lethal limit, *Bioassay, *Shrimp, Water pollution effects, *Mortality, Estuarine environment, *Larval growth stage, *Immature growth stage, *Toxicity, Chlorinated hydrocarbon pesticides, Laboratory tests, Pesticides, Estuarines, Invertebrates, Aquatic animals, Analytical techniques, *Pollutant identification.
Identifiers: *Palaemonetes sp., Sublethal effects.

Juvenile grass shrimp (Palaemonetes pugio) exposed in a laboratory test to Aroclor 1254 had 96 h LC-50 values from 6.1 to 7.8 micrograms/liter. Adult shrimp had 96 h LC-50 values from 41 to 86 micrograms/liter, showing less sensitivity to the PCB than was observed in juvenile shrimp. The effect of Aroclor 1254 on grass shrimp larvae was evident both as mortalities at 15.6 micrograms/liter

and increased duration to the post larval stage at lower exposure levels. (Katz)
W76-10075

SOME EFFECTS OF ACIDIFIED WATER ON THE EARLY DEVELOPMENT OF ROACH (RUTILUS RUTILUS L.) AND PERCH (PERCA FLUVIATILIS L.),
Uppsala Univ. (Sweden). Inst. of Zoophysiology.
N. Johansson, and G. Milbrink.
Water Resources Bulletin, Vol 12, No 1, p 39-48, February, 1976. 2 fig, 6 tab, 7 ref.

Descriptors: *Hydrogen ion concentration, Laboratory tests, On-site investigations, Adaptation, Environmental effects, Reproduction, *Fish eggs, *Immature growth stage, Fish reproduction, Hatching, *Perches, *Acidic water, Mortality.
Identifiers: Perca sp, Rutilus sp, *Roach.

Fertilized eggs of perch (Perca fluviatilus) and roach (Rutilus rutilus) were reared at different pH values in the field and in the laboratory. The results from the laboratory tests revealed that both species showed at least a 50% decrease in hatching frequencies when reared at pH values below 5.6. At pH values below 4.6 both species studied show an almost complete lack of reproduction. The field studies with eggs from different lakes indicated that there might be an adaptation, manifesting itself as a higher frequency of hatching in water with a composition similar to that of the natural habitat. Field experiments also showed that the roach is more sensitive than perch to low pH values. (Katz)

EFFECTS OF KRAFT MILL EFFLUENTS ON BENTHIC MACROPHYTE ASSEMBLAGES IN A SHALLOW-BAY SYSTEM (APALACHEE BAY, NORTH FLORIDA, U.S.A.),
Florida State Univ., Tallahassee. Dept. of Biological Science.
M. S. Zimmerman, and R. J. Livingston.
Marine Biology, Vol 34, p 297-312, 1976. 8 fig, 4 tab.

Descriptors: *Distribution patterns, Plant groupings, Bays, *Biomass, Water pollution sources, Water pollution effects, Benthic fauna, Benthic flora, Biological communities, *Pulp wastes, Shallow water, *Dominant organisms, *Benthos, Biota, Population, Turbidity, Water quality, Aquatic plants, Sampling, Methodology, Statistical models.
Identifiers: Species diversity, *Apalachee Bay(Florida), Kraft mill effluents, Macrophytes.

A 14-month study was carried out to determine the impact of kraft-mill effluents on the offshore benthic macrophyte distribution in a shallow north Florida bay. A polluted river drainage system was compared to an adjoining unpolluted one. Affected areas were characterized by elevated levels of color and turbidity, reduced benthic macrophyte biomass, reduced species diversity and altered species composition. Areas of chronic impact had reduced biomass. On either side of the drainage system uniform increases in number of species were observed. Benthic macrophyte distribution, in terms of biomass and species composition, was considered an important indicator of the impact of KME on this shallow-bay system. Species normally inhabiting deeper water were found in areas of increased turbidity and color, thus explaining the maintenance of species diversity with reduced biomass. Benthic plant assemblages reflected variations in dominance and the occurrence of opportunistic species. (Katz)

EFFECTS OF CALCIUM, STRONTIUM, AND MAGNESIUM ON THE COCCOLITHOPHORID CRICOSPHAERA (HYMENOMONAS) CARTERAE. I. CALCIFICATION,
South Carolina Univ., Columbia. Electron Microscope Lab.
R. L. Blackwelder, R. E. Weiss, and K. M. Wilbur.
Marine Biology, Vol. 34, No. 1, p 17-22, 1976. 3 fig, 2 tab, 17 ref.

Descriptors: *Calcite, *Algae, Environmental effects, *Calcium, *Magnesium, *Strontium, Plant morphology, Mineralogy, Nutrient requirements, Analytical techniques, Laboratory tests, *X-ray diffraction, Pollutant identification.
Identifiers: *Coccolithophorids, *Calcification, *Cricosphaera sp, Coccoliths, Aragonite.

The capacity of cells to calcify in various concentrations of calcium, strontium and magnesium ions was examined following preliminary decalcification in CO2. At a concentration of .01 M Ca, 75% of the cells formed coccoliths within 24 h and almost all cells were recalcified after 2 days. At .001 and .0001 M Ca no recalcification occurred. With the addition of Sr to the Ca-deficient media, calcification took place and the percentage of calcified cells increased with increasing concentrations of Sr. Strontium added to Ca-deficient media was much more effective than an equivalent concentration of Ca. No Sr was deposited in the coccoliths. X-ray analysis demonstrated that calcite was deposited by cells in all concentrations of Ca and Sr at which calcification took place. At concentrations of Mg in the media of 0.0 to .042 M, the cells retained their ability to calcify, although calcification was reduced in the absence of Mg and only calcite was formed. (See also W76-10079) (Katz)

Marine Biology, Vol. 34, No. 1, p 17-22, 1976. 6 fig, 12 ref, 1 tab.

Descriptors: *Algae, Plant morphology, *Growth rates, *Calcium, *Strontium, *Magnesium, *Cytological studies, Plant morphology, Marine algae, Mineralogy, Nutrient requirements, Environmental effects, Marine biology, Nutrients.
Identifiers: *Coccolithophorids, *Cricosphaera carterae, *Cell division, Cell organelles.

Calcium at low levels of .001 M caused reduced growth in the alga Cricosphaera (Hymenomonas) carterae and growth was absent at .0005 M Ca. The addition of Sr to Ca-deficient media enabled cells to divide, the effect increasing with Sr concentration. When 4.6 x 1/10,000 M Sr was added to media containing 1/10,000 M Ca, the rate of division and the final cell concentration were comparable to the control (1/100 M Ca). Strontium was 20 times more effective than Ca. Cell division was nearly absent in Mg concentrations below 4.2 x 1/100,000 M. Cell size increased as the Mg concentration decreased. The lowest protein concentration was found in the absence of Mg. In media lacking Mg, cells exhibited changes in ultrastructure. Fragmentation of chloroplasts and mitochondria was also observed. INFLUENCE OF TEMPERATURE ON BEHAVIOUR, ENERGY METABOLISM AND GROWTH OF MACOMA BALTHICA (L.),
Nederlands Instituut voor Onderzoek der Zee, Texel.
P. A. W. J. de Wilde.
In: Proceedings, 9th European Marine Biology Symposium, H. Barnes, ed. Aberdeen University Press, p 239-256, 1975. 2 tab, 8 fig.

Descriptors: *Temperature, *Growth rates, *Biomass, *Metabolism, Seasonal, Food abundance, *Benthic fauna, *Invertebrates, Animal behavior, Diurnal, Laboratory tests, *Mortality, Energy, *Feeding rates, Food chains, Food webs, Biorhythms, Methodology, Reproduction, Tidal waters, Nutrition.
Identifiers: *Macoma balthica.

Long-term laboratory experiments were conducted to determine the relationships between temperature, food availability, and internal rhythms on seasonal growth irregularities of benthic macro-invertebrates. Macoma balthica thrived best at temperatures from 0-15 C with expulsion of gametes in spring triggered by water temperatures of 10 C. Diurnal behavior patterns were observed which effected energy uptake and expenditure. At higher temperatures deposit-feeding slows down as does food intake. At 15 C the energy balance between food uptake and energy expenditure becomes negative, resulting in emaciation and mortality. Irregular growth in Macoma in its natural habitats is determined by temperature and the availability of living food. (Katz)

BODILY DISTRIBUTION, ACCUMULATION AND EXCRETION OF MERCURY IN A FRESHWATER MUSSEL,
Siena Univ. (Italy). Inst. of Comparative Anatomy.
S. Renzoni, and E. Bacci.
Bulletin of Environmental Contamination and Toxicology, Vol. 15, No. 3, p. 366-373, 1976. 2 fig., 1 tab., 14 ref.

Descriptors: *Mercury, *Bioindicators, *Mussels, Benthic fauna, *Absorption, Water pollution sources, Analytical techniques, Benthos, Shellfish, Invertebrates, Metals, Laboratory tests, *Pollutant identification.
Identifiers: Bioaccumulation, Tissue analysis, Excretion, *Paglia River(Italy).

Mussels collected from the Paglia River, which receives runoff from a mercury extraction operation, were analyzed for mercury content. The whole soft tissue of small mussels (3 cm) contained mercury in concentrations from 0.192 ppm to 0.385 ppm. The digestive gland, gonad and gill of larger mussels contained high concentrations of mercury while the mantle, foot, and adductor muscle contained little. Mercury accumulated in the adductor muscle to greater degrees as the age of the mussel increased. Excretion experiments showed the biological half-life ranged from 15 to 35 days in the gill, gonad, and digestive gland and 60 days for the other tissues. (Katz)

Identifiers: Amphistichus-argenteus, *Asymmetry analysis, Leuresthes-tenuis, Paralabrax-nebulifer.

One of the more difficult tasks in evaluating the possible deleterious effects of multiple toxicants on natural communities is in defining subtle effects before the onset of chronic morbidity. Before detectable changes in either species diversity or species abundance occur subtle changes must take place in a number of important processes ranging from molecular to behavioral changes. Unfortunately, changes in these parameters have proven most difficult to detect with current methodology. The possible use of fluctuating asymmetry as a possible measure of environmental stress was examined. Fluctuating asymmetry is simply the random deviation from perfect symmetry of any bilateral anatomical character. It is, therefore, a nonspecific measure of developmental perturbation. Using asymmetry analysis on 3 species of marine teleost-barred sand bass, Paralabrax nebulifer; grunion, Leuresthes tenuis; and barred surfperch, Amphistichus argenteus-from southern California and Baja California (Mexico), 2 possible asymmetry trends, historical and geographic are defined. Asymmetry values are shown to increase as we approach highly populated areas (southern California) both from the north and south and also with time within southern California. Such increased in asymmetry correlate well with the known distribution of various toxicants from this same area.--Copyright 1973, Biological Abstracts, Inc.

A MATHEMATICAL MODEL OF BLOOMS OF PLANKTON DIATOMS, (IN GERMAN),
Deutsche Akademie der Wissenschaften zu Berlin (East Germany). Forschungsstelle fuer Umweltgestaltung.
H. P. Kozerski.
Int Rev Gesamten Hydrobiol. 59(3), p 367-394, 1974.

Descriptors: Eutrophication, Mathematical models, Diatoms, Potable water, Europe, Plankton, Reservoirs.
Identifiers: Asterionella-formosa, *Germany.

Blooms of plankton diatoms are important to the management of drinking water reservoirs in southern East Germany. A mathematical model was developed to find optimal management alternatives. The model consists of coupled differential equations. The 1st step is a very simple model which is compared with a mass development of Asterionella formosa in the Saidenbach reservoir in the Erzgebirge. The dynamic properties of the improved model are examined with respect to various ecological parameters and initial values. Loss rate and initial biomass of phytoplankton exert the greatest influence in bloom dynamics. The results of the model are compared with a bloom of Asterionella in laboratory cultures and with recent data obtained from the reservoir. A qualitative comparison between model behavior and observations in the lake gives information about the validity range of the model parameters and provides ideas for further development. The applicability to water quality management of the model is considered.--Copyright 1975, Biological Abstracts, Inc.

MINERAL CYCLING IN SOUTHEASTERN ECOSYSTEMS.
Savannah River Ecology Lab., Aiken, S.C.
Available from N.T.I.S., Springfield, Va 22161 as CONF-740513, $24.75 foreign, $27.25. Proceedings of a symposium held at Augusta, Georgia May 1-3, 1974. Published by U.S. Energy Research and Development Administration, Technical Information Center, Office of Public Affairs, 1975, 898 p, CONF-740513. Edited by Fred G. Howell, John B. Gentry, and Michael H. Smith.

Descriptors: *Ecosystems, *Cycling nutrients, *Nutrients, *Southeast US, Aquatic productivity, Food chains, Estuarine environment, *Environmental effects, *Ecology, Recycling, Model studies, Path of pollutants, Biota, Marine fish, Ecological distribution, Water pollution effects, Balance of nature.
Identifiers: *Mineral cycling, Marine environment.

Papers presented during the meeting covered mineral cycling in terrestrial, freshwater, and marine environments, as well as current ideas on modeling. A plenary session examined present knowledge of the principles governing elemental flow, and contributed-paper sessions described recent advances in mineral-cycling research. A panel discussion was devoted to radiocesium in natural environments, especially those in the southeastern United States. (See W76-10267 thru W76-10331)

NUTRIENT RECYCLING AND THE STABILITY OF ECOSYSTEMS,
Georgia Univ., Athens. Dept. of Zoology.
J. R. Webster, J. B. Waide, and B. C. Patten.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, p 1-27. 3 fig, 4 tab, 80 ref, (CONF-740513).

Descriptors: *Stability, *Ecosystems, *Balance of nature, *Cycling nutrients, Resistance, Adaptation, Energy budget, Mathematical models.

This perspective attempts to account for alternatives for persistence at the ecosystem level and at the same time to relate ecosystem response to specific observable and measurable ecosystem attributes. The asymptotic stability of ecosystems is illustrated by equations showing that ecosystem stability is guaranteed by limitations on resource mobilization and by their dissipative character. Resistance, the ability of an ecosystem to resist perturbation, results from the accumulated structure of the ecosystem. Resilience, the ability of an ecosystem to return to a normal trajectory once displaced, reflects inherent dissipative forces. These concepts are shown to be implicit within the linear donor-based model formulations, from which four relative stability indexes were derived: Critical root measures of the system's margin of stability. Mean root is an index of system response time. Natural frequency measures resistance to displacement, and damping ratio measures resilience following displacement. Stochastic analyses indicated that an increase in the amount of recycling relative to input resulted in a decreased margin of stability, faster mean response time, greater resistance, and less resilience. Results also revealed that increased storage and turnover times paralled the relationships as those of recycling. Increase in both recycling and turnover rates produced opposite results, however, leading to a larger stability margin, faster response time, smaller resistance, and greater resilience. A THEORETICAL BASIS FOR ECOSYSTEM ANALYSIS WITH PARTICULAR REFERENCE TO ELEMENT CYCLING,
Oak Ridge National Lab., Tenn. Environmental Sciences Div.
R. V. O'Neill, W. F. Harris, B. S. Ausmus, and D. E. Teichle.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, p 28-40. 3 tab, 43 ref, (CONF-740513).

Descriptors: *Ecosystems, *Theoretical analysis, *Equilibrium, Balance of nature, Biomass, Energy budget, Energy conversion, Energy transfer, Nitrogen, Carbon, *Cycling nutrients.
Identifiers: Terrestrial ecosystems, Aquatic ecosystems.

A conceptualization of ecosystem functions considers: (1) The significance of ecosystem processes, such as element cycling, to the persistence of systems in a fluctuating environment; (2) the control mechanisms regulating these processes; and (3) the construction of a theoretical framework to synthesize available information. The theory assumes that the central strategy of ecosystems is to maintain maximum persistent organic matter, identified by a minimal set of state variables (an autotrophic base, a complex heterotrophic regulators, and a detrital pool) which are the key to the ecosystem's interactions between the components. Although other chemical species are conserved and cycled, nitrogen is of particular interest since it exists naturally in gaseous form and ordinarily must be bound in organic form to be utilized. In addition, since there are no large nitrogen reservoirs in soil minerals, conservation mechanisms would be well developed. Carbon residence times of 50 to 150 years in woody structure and soil organic matter are consistent with the potential role of accumulated organic matter as an alternate energy base to support element release essential to establish new populations after a catastrophe. The small but rapid fluxes of nitrogen through the heterotrophs are sufficient to maintain autotroph processes. (See also W76-10266) (Auen-Wisconsin)

Descriptors: *Model studies, *Decomposing organic matter, *Cycling nutrients, *Forests, *Potassium, *Calcium, Litter, Biodegradation, Invertebrates, Hardwood, Deciduous forests, North Carolina, *Food webs.
Identifiers: Forest litter.

A 10-compartment model of the movement of calcium and potassium in a hardwood forest floor through a cryptozoan food web substantiates the idea that fauna may regulate the litter breakdown on the forest floor without making any great demands on the content of the material itself. The compartments were litter and microflora, Diplopoda, Cryptostigmata, Orthoptera, Pulmonata, Collembola, medium Araneida, Coleoptera, small Araneida, and Mesostigmata. Two sets of models for each element were constructed: time-varying-coefficient models based on the summer state of the system and constant-coefficient models that used the annual integrated fluxes from the first set of models. The nutrient models were supplemented by two biomass models based on the annual potassium and calcium fluxes. Results indicated that the models based on the summer states overemphasized the contribution of mesofauna to litter decomposition. On the basis of the annual nutrient models, Cryptostigmata and Collembola were the most important saprovores and small Araneida and Mesostigmata were the most important predators. The biomass model, based on calcium fluxes, showed that saprovores accounted for possibly 20% of the total annual input. The saprovores in the potassium model accounted for only 1% of the total potassium flux from the litter compartment. (See also W76-10266) (Auen-Wisconsin)

A SPECIFIC-ACTIVITY AND CONCENTRATION MODEL APPLIED TO CESIUM MOVEMENT IN AN OLIGOTROPHIC LAKE,
Oak Ridge National Lab., Tenn.
H. A. Vanderploeg, R. S. Booth, and F. H. Clark.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 142-165. 7 fig, 2 tab, 23 ref.

Descriptors: *Mathematical models, *Radioisotopes, *Systems analysis, Movement, Dynamics, Cesium, Lakes, Sediment-water interfaces, Biological communities, Equations, *Oligotrophy, Eutrophication, Path of pollutants.
Identifiers: *Specific activity, Cs-137.

A linear systems-analysis model is designed to simulate the time-dependent dynamics of specific activity and concentration of radionuclides in aquatic systems. Transfer coefficients were determined for movement of Cs-137 in the components of an oligotrophic lake. These coefficients were defined in terms of basic environmental and ecological data so that the model can be applied to a wide variety of sites. Simulations with a model that ignored sediment-water interactions predicted much higher Cs-137 specific activities in the lake water and biota than did those with the complete model. Comparing Cs-137 concentrations predicted by the model with concentrations reported for the biota of an experimentally contaminated oligotrophic lake indicated that the transfer coefficients derived for the biota are adequate. A control diagram for simulating the flow of specific activity in a hypothetical oligotrophic lake is given. Specific activity in a compartment is controlled only by the flows entering the compartment and by loss of specific activity because of radioactive decay. In contrast, the amount of radionuclide in a lake compartment is regulated by both inflow and outflow. All organisms in the model, except fishes, can be treated as single compartments. Fishes are characterized by collective rate coefficients representing fast and slow compartments. (See also W76-10266) (Auen-Wisconsin)

SYSTEMS MODELS FOR PHOSPHORUS MANAGEMENT IN FLORIDA,
Florida Univ., Gainesville. Dept. of Environmental Engineering Sciences.
M. W. Gilliland
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems' 1975, (CONF-740513), p. 179-208. 7 fig, 2 tab, 38 ref. NOAA SG R/EA-3.

Descriptors: *Model studies, *Florida, *Phosphorus, *Systems analysis, Cycling nutrients, Estuaries, Mining, Aquatic productivity, Management.
Identifiers: Peace River(Fla), Phosphorus budget, Phosphorus mining, Phosphorus cycle, Charlotte Harbor(Fla).

The percent effect on the overall geochemical cycle of the phosphorus flows in peninsular Florida was determined by evaluating an overall state phosphorus budget model. Through mining, Florida is draining its phosphorus supply 125 times as fast as it is replaced. Phosphorus mobilized by mining was three orders of magnitude higher than the phosphorus cycling through its waterways. Digital computer simulation of the phosphorus flux in the Peace River Estuary showed the relative importance of projected changes in mining and population. Total phosphorus in the system ranged from 0.3 to 1.0 mg/l. Simulations indicated that daily mining-water discharges had little effect on total P concentrations and that periodic spills from slime ponds in the mining district elevated P levels for many years. Analog computer simulations of a productivity model for the Peace River mouth (Charlotte Harbor) indicated that high phosphorus levels keep nitrogen levels low (less than 0.1 mg/l), which limits productivity; if this conclusion is valid could the extreme excess of one nutrient make an aquatic system more oligotrophic. The other question posited is whether water quality control based on the percent effect of a given flow on the overall chemical cycle may be more effective than effluent standards based on concentrations. The research implies several P management contingencies in Florida. (See also W76-10266) (Auen-Wisconsin)

LIBRARY U. S. ENVIRONMENTAL ...

Descriptors: *Biological communities, *Oceans, *Stability, *Succession, *Cycling nutrients, Marine algae, Coral, Niches, Tidal marshes, Marine plants, Estuaries, Reefs, Nitrogen, Phosphorus, Ecosystems.
Identifiers: *Marine ecosystems, Sea grass meadows.

The concept that abiotic spatial variables produce a mosaic of responses, reflected by stability and diversity of marine communities, is discussed. Considered are two marine grasses, coral reefs and oceanic plankton. The net diversity of a community, therefore, is the result of population interactions taking place under temporally and spatially varying nutrient regimes and constantly interrupted by physical destruction of portions of the community which will have varying degrees of insularity with respect to repopulation. It is postulated that the most diverse communities are not necessarily the most stable; rather they have moderate resistance and resiliency. Where essential elements are present in excess of needs, populations of high stability develop; where nutrients are adequate, communities of intermediate stability develop; where nutrients are inadequate and where the specific limiting elements may change with time and space, communities are unstable. Disturbance is a significant cause of diversity in coral reefs and their successional response is comparatively slow; in planktonic communities adjacent patches of water differing in nutrient-limitation states may produce a successional mosaic. Thus, intertidal Spartina meadows are the most stable and least diverse; coral reefs are the most diverse, and appear to have intermediate stability; planktonic communities are the most unstable, have moderate to high diversity. DISTRIBUTION OF COPPER AND ZINC IN OYSTERS AND SEDIMENTS FROM THREE COASTAL-PLAIN ESTUARIES,
Virginia Inst. of Marine Science, Gloucester Point.
R. J. Huggett, F. A. Cross, and M. E. Bender.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 224-238, 7 fig, 21 ref. NSF-RANN GI-34-869, AT(49-7)-5.

Descriptors: *Shellfish, *Metals, *Estuaries, Oysters, Copper, Zinc, Bottom sediments, North Carolina, Virginia, Salinity, Trace elements, Rivers, Chesapeake Bay, Saline water-freshwater interfaces.
Identifiers: Newport River(NC), Rappahannock River(Va), York River(Va), Bogue Sound(NC).

A concentration gradient exists in oyster samples from the Newport River estuary, North Carolina, and in the Rappahannock and York estuaries, Virginia, with progressively higher concentrations of either copper or zinc being found in progressively fresher waters, suggesting that a natural phenomenon is responsible. Limited data did not show a concentration gradient for copper, cadmium or zinc in water as a function of salinity. That the sediments serve as a copper and zinc source to oysters was not substantiated. If gradients in concentration of dissolved and particulate copper and zinc are eliminated as possible factors controlling the inverse relationship between salinity and Cu-Zn concentrations in oysters, the following hypotheses are postulated: (1) That zinc may be assimilated from the environment along with calcium by a relative nonspecific ion-transport mechanism to satisfy the organisms' large calcium requirements; (2) at higher salinities the more abundant cations in seawater may be outcompeting the less abundant Cu and Zn for binding sites in the soft tissues; (3) that chelation or complexation of the metals in solution by natural organics, such as fulvic acids, make the elements more available to oysters. As none of these hypotheses can be validated, the metals' bioavailability to organisms, and the consequences of increased releases of metals to estuarine systems cannot be evaluated. EFFECTS OF ENVIRONMENTAL LEVELS OF MERCURY AND CADMIUM ON RATES OF METAL UPTAKE AND GROWTH PHYSIOLOGY OF SELECTED GENERA OF MARINE PHYTOPLANKTON,
Skidaway Inst. of Oceanography, Savannah, Ga.
L. B. Sick, and H. L. Windom.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 239-249, 3 fig, 2 tab, 18 ref. NSF GX-33615.

Descriptors: *Marine algae, *Heavy metals, *Absorption, Mercury, Cadmium, Toxicity, Inhibition, Georgia, Growth rates.
Identifiers: Nitzschia closterium, Carteria, Dunaliella tertiolecta.

This investigation was conducted on Nitzschia closterium, Carteria, and Dunaliella tertiolecta to determine both uptake rates and biological effects of mercury and cadmium to the levels presently occurring in the estuarine and coastal waters of Georgia. Uptake rates of labeled mercury and cadmium were found to be dependent on metal concentrations, length of exposure, and algal genus. Mercury concentrations above 40 ng/l did not significantly increase uptake rates. Cadmium uptake rates were one to two orders of magnitude lower than Hg and were directly proportional to the metal concentration between 20 to 80 ng/l. Nitzschia had higher uptake rates for both metals than Carteria or Dunaliella. Mercuric ion concentration between 30 and 350 ng/l significantly depressed algal growth. Lowered cell-division rates were accompanied by decrease in total cellular nitrogen and lipid and increases in carbon and Hg concentrations. The kinetic processes involved in metal adsorption into algal cells were probably inhibited by exposure to Hg. Differences to metal uptake rates may be attributed to enzyme kinetics, relative surface area to weight ratio of the populations, and/or general physiological adaptations of each genus to culture conditions. Changes in the algal cell chemical composition and decreased productivity caused by naturally occurring Hg levels could conceivably affect growth and productivity at higher trophic levels. THE ROLE OF SPARTINA ALTERNIFLORA IN THE FLOW OF LEAD, CADMIUM, AND COPPER THROUGH THE SALT-MARSH ECOSYSTEM,
Skidaway Inst. of Oceanography, Savannah, Ga.
W. M. Dunstan, H. L. Windom, and G. L. McIntire.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 250-256. 2 fig., 1 tab., 8 ref. NSF GX-33615, SG R/EE-2 (04-3-158-6).

Descriptors: *Heavy metals, *Rooted aquatic plants, *Salt marshes, *Estuaries, Lead, Cadmium, Copper, Georgia, Southeast U.S. Path of Pollutants.
Identifiers: *Spartina alterniflora.

Laboratory measurements indicated that Spartina alterniflora plays only a minor role in the cycle of lead, cadmium and copper in estuarine systems. The plants' response to high concentrations of these metals was: complete mortality to copper; inhibition and growth modification to lead; and no growth modification due to cadmium. The role of Spartina in controlling the flux of metals through the systems is negligible, as a very small portion of the metals discharged by rivers is trapped in the marsh mud or in Spartina. Above 17% the Cd is deposited in the sediment and about 3% occurs in the Spartina crop; 80% of the Cd bypasses the marsh system and enters coastal waters. About 3% of Cu was in Spartina, 22% in the sediment, and 7% flowing through the marsh system. The mean concentration of Cd in sediments surrounding Spartina was 1.19 ppm, whereas the leached fraction contained 0.45 ppm, which is close to the mean of 0.61 ppm found in the plant. The amount available to Spartina represents a very small portion of Cd and Cu in the total system. Toxic levels of lead are an order of magnitude higher than those now occurring in the environment. Increased levels of these metals would have little effect on Spartina. (See also W76-10266) (Auen-Wisconsin).

Descriptors: *Heavy metals, *Absorption, *Fish, *Estuary, Fish food organisms, Fish diets, Crustaceans, South Carolina, Georgia, Florida, Cadmium, Copper, Lead, Zinc.
Identifiers: Silver perch, Weakfish, Spot, Atlantic croaker, Star drum, Oscillated flounder, Bay whiff, Fringed flounder, Windowpane, Oyster toadfish, Blackcheck tonguefish.

Tissue levels of cadmium, copper, lead, mercury, and zinc were determined for 11 common benthic fishes in estuaries between Georgetown, South Carolina and Jacksonville, Florida, specifically, the families of Sciaenidae, Bothidae, Batrachoididae and Cynoglossidae. Analyses for the same metals were run on selected invertebrates that are important food organisms to the fishes studied. Comparison between heavy metals levels and food habits of the fishes generally indicated no positive correlation, although high levels of mercury and lead in Opsanus tau (oyster toadfish) appeared to be associated with elevated levels in crabs, its major food source. Copper and zinc were commonly higher in the tissues of invertebrates than in the fish that fed upon them. The level of trace metals in organisms from different trophic levels apparently depends more on physiological processes within each organism than on the metal concentration in the food. This relationship probably will not apply in instances where pollution loads of heavy metal concentrations high enough to overcome homeostatic mechanisms. (See also W76-10266) (Auen-Wisconsin).

NITROGEN REGENERATION BY THE CTENOPHORE MNEMIOPSIS LEIDYI,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
P. Kremer.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975 (CONF-740513), p. 279-290. 4 fig., 3 tab., 31 ref.

Descriptors: *Cycling nutrients, *Nitrogen, *Estuaries, *Zooplankton, Rhode Island, Ammonia, North Carolina, Virginia, Florida.
Identifiers: *Ctenophores, Comb jelly, Narragansett Bay(RI), York River estuary(VA), Pamlico River estuary(NC), Biscayne Bay(Fla).

Investigative results of nitrogen excretion rates for the comb jelly (Mnemiopsis leidyi) in Narragansett Bay, R. I., and their effect on nitrogen flux are discussed. The flux is compared with other zooplankton excretion rates in the York River estuary (Va.), Pamlico River estuary (N.C.), and Biscayne Bay (Fla.), and evaluated with respect to other nitrogen sources. Respiration is not discussed except to note that oxygen consumption and ammonia excretion agreed closely at all temperatures, yielding an oxygen to nitrogen ratio by atoms of 13:1 with an overall correlation coefficient for all observations of 0.98. Based on biomass, nitrogen excretion, primarily ammonia, was constant over time for individuals, and a direct linear function of population sample at a given temperature. The excretion rates were temperature dependent, ranging from 0.4 to 1.5 microgram atoms of ammonia, per gram of dry weight per hour between 15.8 and 24.5C. The 1971 maximum was about 60 microgram atoms ammonia/cu m/day compared to a 1972 peak of 10 microgram atoms cu m/day. The excretion rates for the four estuaries were comparable to that of other zooplankton during ctenophore abundance. However, both these nitrogen sources are small when compared with the estimated flux from the Narragansett Bay benthos in late summer. (See also W76-10266) (Buchanan-Davidson--Wisconsin).
W76-10284

THE ROLE OF BENTHIC COMMUNITIES IN THE NITROGEN AND PHOSPHORUS CYCLES OF AN ESTUARY,
Rhode Island Univ., Kingston. Graduate School of Oceanography.
S. S. Hale.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 291-308. 7 fig., 1 tab., 42 ref. EPA T900140-04.

Descriptors: *Crustaceans, *Cycling nutrients, *Estuaries, *Benthos, *Nitrogen cycle, Metabolism, Ammonia, Nitrates, Nitrites, Phosphates, Water temperature, Amphipoda, Clams, Sediment-water interfaces, Rhode Island, Annelids, Phosphorus.
Identifiers: Narragansett Bay(RI), Bivalves.

The net sediment-water flux of ammonia, nitrate, nitrite, and inorganic phosphate in Narragansett Bay, R. I., was quantified by the nutrient regeneration role of the benthos. Preliminary attempts were made to determine the factors controlling the fluxes. Bottom chambers were used to obtain in situ measurements from an Ampelisca abdita (amphipod) community on coarse sand, a Nepthys incisa-Nucula annulata (polychaete-bivalve) community on a sandy-silt bottom, and a Mercenaria mercenaria (bivalve) community on sandy silt. Oxygen uptake was used as a measure of metabolism. Over a temperature range from 3.2 to 22.4C, ammonia flux at the sediment surface varied from -4.28 to 276.10 micromoles sq m/hr. Nitrate was transported in both directions across the sediment-water interface, varying from -66.31 to 43.43 micromoles/hr. Nitrite flux was relatively unimportant. Phosphate uptake and release ranged from -9.43 to 41.63 micromoles sq m/hr. Few significant differences were found among the three communities. Temperature exerted a strong influence on the fluxes of ammonia and phosphate. No strong correlations were found between nutrient fluxes and the concentrations of nutrients in the overlying water (with the possible exception of phosphate flux in December and January). The fluxes measured can have significant effects on the nutrient concentrations of the overlying water. (See also W76-10266) (Auen-Wisconsin).

RIVER INPUT OF INORGANIC PHOSPHORUS AND NITROGEN TO THE SOUTHEASTERN SALT-MARSH ESTUARINE ENVIRONMENT,
Skidaway Inst. of Oceanography, Savannah, Ga.
H. L. Windom, W. M. Dunstan, and W. S. Gardner.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' (CONF-740513), p. 309-313. 1 fig, 1 tab, 12 ref. EPA R-800372.

Descriptors: *Salt marshes, *Phosphorus, *Nitrogen, *Rivers, South Carolina, Florida, Southeast U.S., Georgia, Rooted aquatic plants, Runoff.
Identifiers: Spartina alterniflora, Nutrient sources, Pee Dee River(SC), Black River(SC), Santee River(SC), Cooper River(SC), Savannah River(Ga), Ogeechee River(Ga), Altamaha River(Ga), Satilla River(Ga), St. Johns River(Fla), Cord grass.

The Pee Dee, Black, Santee, and Cooper Rivers in South Carolina; the Savannah, Ogeechee, Altamaha, and Satilla Rivers in Georgia; and the St. Johns River in Florida account for 95% of the total discharge of fresh water to the salt-marsh estuaries between Georgetown, South Carolina and Jacksonville, Florida. The supply of inorganic phosphorus and nitrogen to the ecosystem was determined by bimonthly analyses of phosphorus, ammonia, and nitrate content of the rivers. The annual supply of inorganic phosphorus is adequate to supply the total phosphorus required by the approximately one million acres of Spartina salt marsh. The annual supply of inorganic nitrogen can supply only about 20% of that required, suggesting that much of the nitrogen in the vegetation is recycled. Input of nitrogen by atmospheric fallout is probably insignificant, as is the river supply of organic and particulate nitrogen. Computations indicated that the annual river inputs of N and P to the marshes are 220 and 10 mg atoms/sq m, respectively. If it assumed that the suspended load (averaging 15 mg/l) contains about 1% of available N, the total annual supply of N is estimated at 375 mg atoms/N sq m in addition to that supplied as dissolved nitrate and ammonia. The indication is that nitrogen limits productivity in these environments. (See also W76-10266) (Auen-Wisconsin).
W76-10286

NUTRIENT FLUX AND CYCLING IN FRESHWATER ECOSYSTEMS,
Cornell Univ., Ithaca, N. Y. Section of Ecology and Systematics.
G. E. Likens.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 314-348. 8 fig., 10 tab., 96 ref.

Descriptors: *Cycling nutrients, *Lakes, *Streams, *Input-output analysis, Biochemistry, Geochemistry, Gases, Air-water interfaces, Nitrogen, Phosphorus, Carbon, Precipitation(Atmospheric), Runoff, Sedimentation.
Identifiers: *Nutrient flux, *Nutrient budget.

The flux and cycling of nutrients, the contribution of nutrients by biogeochemistry, and their impact on an aquatic ecosystem nutrient budget are discussed. The ecological implications of adding nutrients in intermittent large concentrations and in small volumes as opposed to adding the same total imput in continuously smaller concentrations but in large volumes and over long periods are not well known, but have important ramifications for the management of point and nonpoint sources of nutrients and pollutants. To gain maximum understanding, studies should be done of nutrient fluxes for whole ecosystems. Real progress in understanding aquatic ecosystems will depend on the ability to relate and integrate nutrient-flux and cycling parameters, e.g., knowledge of internal nutrient-turnover rates is critical to understanding nurient availability in lakes, but these rates must be dynamic--linked to the continuous flux of ecosystem inputs and outputs. Turnover rates for seston vary from minutes for phosphorus to hours and days for nitrogen, and hours and weeks for carbon. In contrast, nutrient residence times for total ecosystems usually range from weeks to years, depending on rates of sedimentation, mixing, and throughput. Integrating these variables should lead to new levels of sophistication in diagnosing and managing aquatic ecosystems. (See also W76-10266) (Auen-Wisconsin).

THE SANTEE SWAMP AS A NUTRIENT SINK,
South Carolina Univ., Columbia. Dept. of Biology.
W. M. Kitchens, J. M. Dean, L. H. Stevenson, and J. H. Cooper.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975 (CONF-740513), p. 349-366. 7 fig, 25 ref.

Descriptors: *Nutrient removal, *Water purification, *Swamps, Southeast U.S., Streams, Freshwater marshes, Phosphorus compounds, Nitrogen compounds, Coliforms, Self-purification, Pollution abatement, South Carolina.
Identifiers: *Santee Swamp(SC), Nutrient sink, Wateree River(SC), Congaree River(SC).

The Upper Santee Swamp, South Carolina, extending from the confluence of the Congaree and Wateree Rivers, was studied for its role in the reduction of nutrient loads and fecal coliforms. The two rivers are heavily polluted from sewage discharges and agricultural runoff but Lake Marion, an impoundment five miles downstream of the rivers' confluence has not shown eutrophication symptoms typical of shallow impoundments receiving comparable nutrient loads. The general trend observed, for both total and reactive phosphates, a 50% reduction in concentrations as the water passed from the rivers to the lower swamp provinces, depending on flow. Nitrate concentrations, consistently high in both rivers, was essentially unaltered in passage through the swamp. The flow through the swamp during the study period was usually a mass sheet over the floodplain floor, with no additional stream runoff inputs, therefore concentration changes are definitely not due to dilution. The nutrient sink is considered primarily biological, with possible total phosphates adsorbed to suspended silts and clays. There was also a significant reduction in bacterial counts, including fecal coliforms, with little or no oxygen depletion as the waters coursed over the swamp. (See also W76-10266) (Auen-Wisconsin).
W76-10288

THE ROLE OF EMERGENT MACROPHYTES IN MINERAL CYCLING IN A FRESHWATER MARSH,
Wisconsin Univ., Milwaukee. Dept. of Botany.
J. M. Klopatek.
In: Proceedings of a symposium 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 367-393. 9 fig., 5 tab., 53 ref.

Descriptors: *Cycling nutrients, *Rooted aquatic plants, *Freshwater marshes, *Nutrient removal, Productivity, Wisconsin, Wetlands, Nitrogen, Phosphorus, Soil chemistry, Water chemistry, Cattails, Energy transfer, Bullrushes, Willow trees.
Identifiers: Theresa Marsh(Wis), Emergent macrophytes, Burr reed, Sedge, Canary grass.

Theresa Marsh, Wisconsin, was investigated by examining both the ontogeny of the species and their patterns of nutrient uptake and release. Three variable linear regression equations were employed to compare the changes in the amount of nutrients (g/sq m) in the belowground and the aboveground standing crops and the level of soil nutrients in monotypic stands of Typha latifolia, Scirpus fluviatilis, and Carex lacustris. The highly significant correlation values between both Scirpus and Carex (and to a lesser extent Typha) and total soil nitrogen was somewhat surprising since, in continually waterlogged soils, ammonia is regarded as the sole plant-available nitrogen. The magnitude of correlations with phosphorus indicated that the emergent macrophytes are per-

haps the factor controlling the flux of phosphorus n the soil during the growing season. Total nitrogen and available phosphorus in the marsh soil appear to be adequate; the macrophytes are acquiring their nutrients from the soil, and control he nutrients within the soil during the growing season. Denitrification reactions appeared to occur throughout the year, especially during summer. Potassium, calcium, and magnesium concentrations throughout the year appeared dependent on the macrophyte uptake and leaching osses, total respiration in the marsh, and the physical and chemical characteristics of the water. See also W76-10266) (Auen-Wisconsin).
W76-10289

CHANGES IN WATER CHEMISTRY AND PRIMARY PRODUCTIVITY OF A REACTOR COOLING RESERVOIR (PAR POND),
DuPont de Nemours (E. I.) and Co., Aiken, S. C. Savannah River Lab.
. J. Tilly.
n: Proceedings of a symposium 'Mineral Cycling n Southeastern Ecosystems,' 1975, (CONF-40513), p. 394-407. 4 fig., 5 tab., 25 ref.

Descriptors: *Primary productivity, *Water hemistry, *Impoundments, *Water cooling, Nuclear reactors, Eutrophication, Ions, South Carolina, Eutrophication.
dentifiers: *Par Pond(SC), Savannah River(SC).

Unsuspected changes in Par Pond, South Carolina, in its characteristics, primary productivity, and water chemistry, which are apparently related to reactor operations are summarized and possible connections to reactor operations and consequences for the reservoir community are discussed. Initially the primary productivity increased sixfold, and the dissolved solids doubled. The dissolved solids increase appears to have been caused by addition of makeup water from the Savannah River and by evaporative concentration during the cooling process. As the dissolved solids concentrations and the conductivity of makeup water leveled off, the primary productivity stabilized. Major cation and anion concentrations generally followed total dissolved solids through the increase and plateau; however, silica concentrations declined steadily during the initial periods of increased plankton productivity. Standing crops of net seston and centrifuge seston did not increase during this initial period. The collective data show the effects of thermal input to a cooling reservoir, illustrate the need for limnological studies before reactor siting, and suggest the possibility of using makeup water additions to power reactor cooling basins as a reservoir management tool. Continuing observations will be made of the growth rates of top carnivores during the current leveling and decline in plankton productivity to explain the turnover increases of the lower trophic levels but not in the standing crops. UPTAKE AND ELIMINATION OF RADIOTUNGSTEN IN BLACK BULLHEADS,
Virginia Commonwealth Univ., Richmond. Dept. of Biology.
R. Reed.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 435-444. 2 fig., 2 tab., 12 ref.

Descriptors: *Radioisotopes, *Bullheads, *Animal metabolism, *Absorption, Fish, Exudation, Persistence.
Identifiers: *Tungsten, Elimination.

Radiotungsten uptake and turnover were studied in a poikilothermic vertebrate, the black bullhead, Ictaluras melas after accumulation from water and food. Whole-body activity reached a plateau after the fish were in labeled water for 4 days at 14C with elimination varying according to the manner of uptake. Fish which accumulated radiotungsten from water had a single exponential component of elimination with a biological half-life of 2.75 days. When fish received the radioisotope in a single feeding, activity was lost at two rates: one component had a biological half-life of 14 hours and the second, six days. The bones, flesh, skin, gills, guts and blood contained the greatest percentage of whole-body activity after one day of uptake from water. When activity losses were followed for 16 days, all tissues examined showed a rapid decrease, with biological half-lives of 2.1-8.0 days. Bone had the longest biological half-life (8.0 days). Flesh, gills, bones, and guts contained 78.6% of the total activity after 8 days. Bone contained 32.2% of the whole-body activity initially and 69.8% after 16 days elimination. Radiotungsten distribution in bullheads is similar to the distribution in rats. (See also W76-10266) (Buchanan-Davidson--Wisconsin)

MOBILIZATION OF MERCURY FROM FRESHWATER SEDIMENTS BY HUMIC ACID,
Georgia Univ., Athens. Dept. of Zoology.
R. W. Miller, J. E. Schindler, and J. J. Alberts.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 445-451. 2 fig., 1 tab., 12 ref. EPA R-800427.

Descriptors: *Mercury, *Freshwater, *Sediments, *Humic acids, Sulfides, Translocation, Estuaries, Absorption, Hydrogen ion concentration.
Identifiers: Mercury mobilization.

Sediments rapidly absorb inorganic mercury. When sulfides are present, insoluble mercuric sulfide is formed. Bacteria may form methylmercury, which may be released or changed by demethylating bacteria to elemental mercury. Humic materials in sediment reduce mercury. With excess humic acid, elemental mercury is released from sediments; decreases in humic acid decrease the rate and amount of elemental mercury released. Large increases in humic acids relative to mercury inhibit the reaction. Reduction of ionic to elemental mercury is mediated by humic acids. Strong complexation of mercury by humic acid may also occur. Excess humic acid binds all mercury, immobilizing it in ionic or elemental forms. When sediment humic acid concentrations are high, small amounts of mercury are complexed and elemental mercury is not released. Sediments with lower organic contents release elemental mercury. When sediment humic acid concentrations remain constant, mercury increases more than can be complexed and elemental mercury is released. If mercury additions cease, excess mercury is reduced and mercury bound to humic acid remains in sediment. Sulfides probably cause permanent removal of mercury to the sediment. Usually mercury is immobilized in sediment with only small amount available for release as elemental or methylmercury. (See also W76-10266) (Buchanan-Davidson--Wisconsin).

RADIOCESIUM LEVELS IN VEGETATION COLONIZING A CONTAMINATED FLOOD PLAIN,
Savannah River Ecology Lab., Aiken, S.C.
C. T. Garten, L. A. Briese, R. A. Geiger, R. R. Sharitz, and M. H. Smith.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 489-497, 2 fig, 1 tab, 17 ref. AT(38-1)-819, AT(38-1)-310, AT(38-1)-708.

Descriptors: *Cesium, *Radioisotopes, *Vegetation, Soil contamination, Environmental effects, Radioactive wastes, Water pollution, South Carolina, Nuclear reactors, Leaves, Regression analysis, Sediments, Coastal Plains, Bulrushes, Willow trees, Shrubs, Absorption, Southeast U.S.
Identifiers: *Steel Creek(SC), Herbaceous plants, Stems, Fruits.

Radionuclides had been released into Steel Creek at the Atomic Energy Commission's Savannah River Plant, South Carolina, from 1961 to 1970. Cesium-137 is considered to have the greatest biological significance because of its long half-life. Steel Creek soils had low radiocesium fixing capacities but cesium might be concentrated by vegetation, so radiocesium levels were measured in dominant plant species. Radiocesium concentrations in component parts of woody and herbaceous plants were log normally distributed. Leaves and stems of herbaceous plants (Andropogon and Scirpus cyperinus) contained more radiocesium than those of woody plants (Alnus serruleta, Myrica cerifera, and Salix nigra). Andropogon and Alnus fruits had higher concentration than leaves or stems. Fruit and leaf concentrations could be significantly correlated with stem levels in most species sampled. Levels in plant species and their component parts were highly variable but predictable at local levels. Mean levels in plant parts exceeded mean soil concentrations, indicating radiocesium concentration by vegetation. Simple regression equations were adequate predictors of leaf concentrations from stem concentrations in all plant species studied. With large radiocesium releases, uptake by vegetation from contaminated sediments might be a greater environmental problem in southeastern coastal plain streams than in ecosystems where radiocesium would be more actively fixed by soils. (See also W76-10266) (Buchanan-Davidson--Wisconsin)

SEASONAL VARIATION IN RADIOCESIUM CONCENTRATIONS IN THREE TREE SPECIES,
Savannah River Ecology Lab., Aiken, S.C.
C. T. Garten, L. A. Briese, R. R. Sharitz, and J. B. Gentry.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 498-508. 1 fig., 2 tab., 15 ref. AT(38-1)-708, AT(38-1)-819.

Descriptors: *Cesium, *Radioisotopes, *Trees, Leaves, Willow trees, Distribution, South

Carolina, Root systems, Nuclear wastes, Nuclear reactors, Seasonal, Soil contamination, Southeast U.S., Absorption, Leaching, Translocation, Statistical methods, Food chains, Environmental effects.
Identifiers: *Steel Creek(SC), Stems, Wax myrtle, Black willow, Tag alder.

Radiocesium dynamics were studied in leaves and stems of black willow (Salix nigra), wax myrtle (Myrica cerifera), and tag alder (Alnus serrulata) inhabiting the vicinity of Steel Creek, which received production-reactor effluents from the Savannah River Plant, South Carolina. Willow and myrtle leaf radiocesium levels were highest in spring, then declined during the growing season; stem levels remained unchanged or increased slightly. Seasonal changes occurred in alder parts and varied with site studied. Relationships between parts were consistent within species and collecting sites in summer. Radiocesium was highest in roots, then leaves, and lowest in stems. Mean soil to plant-part concentration factors in summer ranged from 0.9-7.6 and species means across leaves, stems, and roots averaged 2.1, 3.8, and 6.2 for alder, willow, and myrtle, respectively. Radiocesium transport from foliage to roots and soil was not demonstrated, but increasing concentrations in willow and some alder stems during the growing season suggested that stem tissue resorb from leaves. Leaching from willow and alder leaves was probably more important than translocation in reducing concentrations in spring and summer. Due to high leaf concentrations in spring and summer, herbivores ingest more radiocesium. Translocation bark into woody tissues in fall retains radiocesium in the ecosystem and reduces cesium loss in leaf fall. (See also W76-10266) (Buchanan-Davidson--Wisconsin)

CHEMICAL COMPOSITION OF WHITE-TAILED DEER: WHOLE-BODY CONCENTRATIONS OF MACRO- AND MICRONUTRIENTS,
Savannah River Ecology Lab., Aiken, S. C.
J. G. Wiener, I. L. Brisbin, and M. H. Smith.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 536-541. 1 tab., 20 ref. AT(38-1)-819, AT(38-1)-708.

Descriptors: *Deer, *Chemical properties, *Trace elements, Calcium, Potassium, Magnesium, Sodium, Phosphorus, Copper, Iron, Manganese, Molybdenus, Zinc, Nitrogen, Regression analysis, Energy budget, South Carolina, Hunting, Biomass, Cycling nutrients, Forests.
Identifiers: White-tailed deer.

The wet- and dry-weight concentrations of macronutrients (calcium, potassium, magnesium, nitrogen, sodium, and phosphorus) and micronutrients (copper, iron, maganese, molybdenum, and zinc) were measured in whole-body samples of 27 white-tailed deer (Odocoileus virginianus). Linear regression of nutrient concentrations on body weight indicated no significant change in concentration with respect to body weight. Coefficients of variation for the macronutrient concentrations averaged less than those for micronutrient concentrations. Only magnesium, manganese, and molybdenum had coefficients of variation greater than 25%. Coefficients of variation for wet- and dry-weight concentrations were similar for each element. In the vicinity of Savannah River Plant, South Carolina, there are approximately 0.16 deer/ha with a wet value of approximately 44.54 kg/deer, producing a wet-weight biomass density of 7.13 kg/ha. Since 1967 deer hunts have removed about 1.15 deer/sq km/year or 0.52 kg wet-weight biomass/ha/year. Nutrient exportation was calculated on a per hectare scale using wet-weight concentrations and the above biomass value. Nutrient standing crops of deer are small compared to those of primary producer components of temperate forest ecosystems. Annual loss of nutrients by deer harvest is negligible compared with annual nutrient budgets of southeastern forests. (See also W76-10266) (Buchanan-Davidson-Wisconsin)
W76-10303

RADIOCESIUM CONCENTRATIONS IN WHOLE-BODY HOMOGENATES AND SEVERAL BODY COMPARTMENTS OF NATURALLY CONTAMINATED WHITE-TAILED DEER,
Savannah River Ecology Lab., Aiken, S. C.
I. L. Brisbin, and M. H. Smith.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 542-556. 2 fig., 3 tab., 20 ref. AEC AT(38-1)-310, AT(38-1)-708.

Descriptors: *Cesium, *Radioisotopes, *Absorption, *Deer, *Distribution, South Carolina, Correlation analysis, Analytical techniques, Retention.
Identifiers: White-tailed deer, Deer tissues, Bone, Organs, Muscle.

Radiocesium concentrations were studied in body compartments of white-tailed deer at the Atomic Energy Commission's Savannah River Plant, South Carolina. The highest levels (average of 50-70 picocuries radiocesium/g dry weight) were in skeletal muscle, feces, kidneys, and adrenal tissue; bone and liver had the lowest values. Except for feces and rumen contents, most tissues and organs showed positive linear correlations between their radiocesium levels. Radiocesium in brain, liver, and lungs increased at slower rates than the whole body, while adrenal and kidney tissues increased at faster rates. Analyses of whole-body homogenates showed that deer averaged 9.91 picocuries radiocesium/g whole body wet weight. These values were best predicted from skeletal muscle radiocesium contents using the relationship: picocuries radiocesium/g dry Whole body weight equals 3.33 + 0.60 picuries/g dry skeletal muscle. Calculation of a weighted predictive index indicated that skeletal muscle concentrations best predicted the overall pattern and levels of radiocesium distribution in all body compartments. Radiocesium concentrations in brain, heart,and liver followed muscle in order of predictive ability. Use of a single organ or tissue sample to estimate body contents and distribution of other environmental contaminants is discussed. (See also W76-10266) (Buchanan-Davidson--Wisconsin)
W76-10304

RELATIONSHIP BETWEEN POTASSIUM INTAKE AND RADIOCESIUM RETENTION IN THE REINDEER,
Alaska Univ., College. Inst. of Arctic Biology.
D. G. Holleman, and J. R. Luick.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 557-563. 2 fig., 1 tab., 12 ref. AEC AT(45-1)-2229

Descriptors: *Potassium, *Cesium, *Radioisotopes, Lichens, Food habits, Sorption, Fallout, Retardants, Retention, Summer, Winter, *Absorption.
Identifiers: *Reindeer.

To determine the effects of potassium intake on radiocesium retention in reindeer when the animals were maintained on a winter diet of lichens, several reindeer (Rangifer tarandus sibericus) were fed lichen plus potassium ad libitum then injected intravenously with cesium-134. Potassium added to the diet markedly decreased radiocesium retention, suggesting that seasonal changes in cesium retention observed earlier in reindeer might be largely caused by nutritional factors. A 20-fold increase in dietary potassium caused a 2-fold decrease in radiocesium retention. An equation describes cesium retention as the sum of a fast exponential component and a slow exponential component. The increased potassium intake affected the slow component, especially. A decrease in cesium retention due only to increase in potassium intake would necessitate a 20 to 100-fold increase in intake from winter to summer; this could be achieved by consuming food with higher potassium contents, increasing food intake, and/or using high potassium mineral licks. Normally free grazing reindeer consume more than ten times as much potassium in the summer; also food intake probably increases in the summer. Mineral licks would also be more available and used more in the summer when reindeer graze on ranges free of snow and ice. (See also W76-10266) (Buchanan-Davidson-Wisconsin))

BASE-LINE DATA ON EVERGLADES SOIL-PLANT SYSTEMS: ELEMENTAL COMPOSITION, BIOMASS, AND SOIL DEPTH,
Florida Univ., Gainesville. Inst. of Food and Agricultural Sciences.
B. G. Volk, S. D. Schemnitz, J. F. Gamble, and J. B. Sartain.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 658-672. 1 fig, 3 tab, 21 ref.

Descriptors: *Chemical properties, *Florida, *Freshwater marshes, *Trace elements, *Heavy metals, *Marsh plants, Soil types, Baseline studies, Muck soils, Nitrogen, Phosphorus, Potassium, Calcium, Magnesium, Sodium, Copper, Iron, Manganese, Zinc, Cobalt, Strontium, Lead, Nickel, Chromium, Aluminum, Silica, Cesium.
Identifiers: *Everglades(Fla).

Baseline data on biomass production and elemental composition of plants from locations representative of Everglades saw-grass (Cladium jamaicense) ecosystems (burned and unburned), a wet prairie community, and a burned muck site of saw-grass were collected in the Everglades Wildlife Management Area, Florida. Chemical compositions (Nitrogen, phosphorus, potassium calcium, magnesium, sodium, copper, iron, manganese, zinc, cobalt, strontium, lead, nickel, chromium, aluminum, and silica) were determined in plant and soil digests. Saw-grass was predominant and contributed to biomass in all plots except in the wet prairie where Rhynchospora and Panicum hemitomon were the most common. Dead saw-grass biomass was greater than that of living plants in unburned saw-grass plots. In burned saw-grass, muck burn, and wet prairie, there were a large number of plant species but biomass production was less than in unburned saw-grass locations. Levels of copper, manganese, calcium, magnesium, potassium, and nitrogen varied in different locations. Significant differences in chemical composition were observed between plant species. Zinc, calcium, magnesium, phosphorus, and nitrogen concentrations were low in live saw-grass, compared to other species. Fallout cesium-137 levels ranged from 670 to 3100 picocuries/kg in sandy and organic soils, respectively. The Polygonum Cs-137 level was 11,600 picocuries/kg. Rapid Cs-137 leaching was observed from dead saw-grass. (See also W76-10266) (Buchanan-Davidson--Wisconsin)

EFFECTS OF TREE SPECIES, TEMPERATURE, AND SOIL ON TRANSFER OF MANGANESE-54 FROM LITTER TO ROOTS IN A MICROCOSM,
Oak Ridge National Lab., Tenn. Environmental Sciences Div.
M. Witkamp, and B. Ausmus.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 694-699. 1 fig., 1 tab., 10 ref. NSF AG-199, 40-193-69.

Descriptors: *Cycling nutrients, *Sorption, *Trees, *Manganese, *Soil microorganisms, Litter, Roots, Decomposing organic matter, Black locust trees, Loblolly pine trees, Limestones, Shales, Leaching, Movement, Percolation, Hydrogen ion concentration, Detritus, Model studies.

Litter, soil, and microbial effects on manganese-54 transfer from litter to roots were compared to two litter decomposability levels (black locust-rapid and loblolly pine-slow), two soils (dolomitic limestone and sandstone-shale), and microbial activity levels at 2C and 25C. Mn-54 leachability and mobility were high during the first week. Pine litter was greater and affected more by temperature. Litter species affected Mn-54 downward percolation and seedling uptake. Locust leachate was viscous, black, with a pH of 8.4 and high organic content. Adsorption to leached organics and microbial immobilization kept Mn-54 in the top layer. Pine needles showed no decomposition; leachate color was light and viscosity, bacterial content, soil infiltration by leachate, and microbial blooms low, suggesting little microbial immobilization in topsoil. Temperature effects were evident in pine leachate Mn-54 content; there was no microbial growth on pine needles at 2C. Temperature effects were reversed with locust litter and topsoil; at 25C decay mineralized more litter Mn-54 than was immobilized by microflora. Topsoil Mn-54 retention prevented it from reaching leachate. Litter species and microbial activity rates were dominating factors in Mn-54 recycling from detritus-plants. Soils types had no effect on transfer from litter-topsoil-bottom soil, but affected uptake by trees. Element transfer models should consider microbial action. MINERAL CYCLING STRATEGIES OF TWO DECIDUOUS AND TWO EVERGREEN TREE SPECIES ON A SOUTHERN APPALACHIAN WATERSHED,
Georgia Univ., Athens. Dept. of Botany.
F. P. Day, and D. T. McGinty.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 736-743. 3 tab, 10 ref. NSF AG 199,40-193-69.

Descriptors: *Cycling nutrients, *Hardwood, *Trees, North Carolina, Oak trees, Hemlock trees, Biomass, Primary productivity, Nitrogen, Phosphorus, Potassium, Calcium, Magnesium, Bark, Leaves, Shrubs, Southeast US.
Identifiers: *Evergreen trees, Coweeta Hydrological Laboratory(NC), Dogwood, Rhododendron maximum.

The mineral-cycling strategies of two canopy species (one deciduous, Quercus prinus, and one evergreen, Tauga canadensis) and two subcanopy trees (one deciduous, Cornus florida, and one evergreen, Rhododendron maximum) at the Coweeta Hydrological Laboratory, North Carolina, were compared, based on biomass production and nutrient standing crops. Phosphorus, potassium, calcium, nitrogen, and magnesium were determined in the wood, bark, current twigs, and leaves of each species. The largest total nutrient standing crop was in Quercus because of its large biomass. The greatest proportion of leaf calcium and magnesium was in Rhododendron. Cornus was important in the annual nutrient cycle, because of its large number of nutrient-rich leaves. Quercus was important in the annual and in the long-term nutrient cycle. Rhododendron was important in an intermediate length cycle, because its turnover time is about seven years. In a mature forest, nutrients are stored in the vegetation and recycled at time intervals of a year to several hundred years, depending on the plant component. Depending on species growth habits, individual species may be more important in one or more phases of the cycling scheme. (See also W76-10266) (Buchanan-Davidson--Wisconsin)

SOME EFFECTS OF FERTILIZATION ON MINERAL CYCLING IN LOBLOLLY PINE,
Southeastern Forest Experiment Station, Research Triangle Park, N.C. Forestry Sciences Lab.
C. G. Wells, A. L. Nicholas, and S. W. Buol.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 754-764. 5 tab, 7 ref. NSF AG 199,40-193-69.

Descriptors: *Fertilization, *Cycling nutrients, *Loblolly pine trees, Nitrogen, Phosphorus, Potassium, Litter, Throughfall, Soil water, Nitrates, Precipitation(Atmospheric), Southeast US, Forest soils, Leaching, Manganese, Sodium, Calcium, Magnesium, Zinc, Copper, Aluminum.

Effects of nitrogen, phosphorus, and potassium fertilization of a 14-year-old loblolly pine plantation on nutrients in litterfall and throughfall, on mineral accumulation in the forest floor, and on minerals in soil water were studied. Nitrogen, phosphorus, and potassium applied at rates of 226, 60, and 136 kg/ha as ammonium nitrate, triple superphosphate, and muriate of potash, respectively, were not immobilized in the forest floor. Some nitrate-nitrogen leached 120 cm into the soil to levels of 7 ppm at some points, but its concentra-

tion declined to about 0.5 ppm three years later. Nitrate-nitrogen loss below 120 cm was approximately balanced by precipitation input. The first year after fertilization increased mineral elements in litterfall and throughfall accounted for about 5% of nitrogen and 10% of potassium applied. The second year increased litterfall and increased concentrations in litterfall and throughfall amounted to 10% of the nitrogen plus phosphorus applied. Differences between fertilized and nonfertilized plots indicated that 25% of the applied nitrogen was in the forest floor two years after fertilization, but litterfall rather than immobilization of applied nitrogen appeared to be the major source of additional nitrogen. INFLUENCE OF NUTRIENT AVAILABILITY ON ECOSYSTEM STRUCTURE,
Mansfield State College, Pa. Dept. of Biology.
K. A. Meyer, J. F. McCormick, and C. G. Wells.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p 765-779. 2 fig, 3 tab, 31 ref. AEC AT(110-1)-3299.

Descriptors: *Granites, *Cycling nutrients, *Plant populations, Productivity, Biomass, Distribution patterns, Succession, Soil density, Limiting factors, Calcium, Magnesium, Potassium, Phosphorus, Nitrogen, Nitrates, Ammonia, Rainfall, Leaching, Organic matter, Hydrogen ion concentration, Cation exchange, Southeast US, Trace elements.
Identifiers: *Granite outcrops, Sedum smallii, Minuartia uniflora, Viguiera porteri, Herbaceous plants, Mt Arabia(Ga).

Ecosystem structure (production distributions, densities, and biomass) was analyzed in island ecosystems of annual perennial herb type plants on granite outcrop soils on Mt. Arabia, Georgia. Availability of nutrients (calcium, magnesium, potassium, phosphorus, nitrogen, nitrates, ammonia) in soil of each species habitat, including contributions from rain, groundflow, soil pools, soil organic matter mineralization, and leaching from dead vegetation was determined. Nutrient uptake was estimated for Sedum smallii, Minuartia uniflora, and Viguiera porteri. From comparisons of nutrient availability in different habitats with nutrient levels required by the dominant populations, an hypothesis is developed suggesting that species population distribution in outcrop ecosystems is influenced by nutrient availability and/or competition for available nutrients. The shallow sandy soils with a low pH were relatively infertile. Soil organic matter, cation-exchange capacity, and soil nutrients (except phosphorus) increased toward the ecosystem center. Comparisons of nutrient uptakes by each species with estimated annual nutrient availability showed the growth potential of each species in areas outside its natural occurrence. Soil nutrients became limiting to growth and distribution of the dominant plants, thus affecting the ecosystem structure. Calcium, magnesium, and nitrogen availability plus interspecific competition for these elements limited species growth and distribution when there was adequate moisture. NUTRIENT BUDGETS FOR UNDISTURBED ECOSYSTEMS ALONG AN ELEVATIONAL GRADIENT IN NEW MEXICO,
New Mexico Univ., Albuquerque. Dept. of Biology.
J. R. Gosz.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 780-799. 3 fig., 7 tab., 28 ref.

Descriptors: *Energy budget, *Cycling nutrients, *Ecosystems, *Biomes, New Mexico, Watersheds(Basins), Vegetation, Calcium, Sodium, Magnesium, Potassium, Confierous trees, Bedrock, Alpine, Precipitation, Mountains, Dusts, Slopes, Input-output analysis, Evapotranspiration, Primary productivity, Elevation, Juniper trees, Grasslands, Semiarid climates, Runoff.
Identifiers: Tesuque Watersheds(NM), Sangre de Cristo Mountains(NM), Santa Fe National Forest(NM), Aspen trees.

The Tesuque watersheds in the Sangre de Cristo Mountains of New Mexico were selected for ecosystem studies in which nutrient flux was determined in different vegetational zones and biomes along an elevational gradient on a common bedrock. Nutrient budgets for calcium, magnesium, sodium, and potassium were determined during 1972-1973 for watershed ecosystems with vegetation ranging from pinion-juniper to spruce-fir and alpine tundra. Nutrient inputs varied with elevation due to precipitation at high elevations and dust at low elevations. Seasonal quatity and distribution of precipitation affected relationships between nutrient inputs from dust and precipitation. Stream chemistry and nutrient output (dissolved loss) varied with elevation and involved evapotranspiration, nutrient uptake, throughfall, discharge volume, carbon dioxide production in soil, and soil chemistry. The nutrient budgets indicated that the smallest loss or greatest accumulation usually occurred on intermediate elevations which had a mixed conifer vegetation. This zone had the greatest plant and animal diversity. The high evapotranspiration rate of this zone suggested that it had the highest primary production rate. The results supported the hypothesis that a high efficiency of nutrient cycling (nutrient conservation) is associated with high productivity and community complexity. NITROGEN FIXATION BY LICHENS OF THE NORTHERN PIEDMONT,
Wake Forest Univ., Winston-Salem, N. C.
J. C. Murphy, and V. E. Becker.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p. 824-832. 3 tab., 23 ref.

Descriptors: *Nitrogen fixation, *Lichens, *Cyanophyta, *Symbiosis, Light, Moisture, North Carolina, Forests, Varieties, Deciduous trees, Temperature.
Identifiers: Northern Piedmont(NC), Leptogium cyanescens, Leptogium corticola, Collema subfurvum, Collema conglomeratum, Sticta weigelii, Lobaria pulmonaria, Lobaria quercizans.

Nitrogen fixation by lichens containing blue-green algae phycobionts was determined with an acetylene-reduction method in presence of light and high moisture. Specimens collected in mature forests in the northern Piedmont, North Carolina, included lichen containing blue-green algae as primary phycobionts (Leptogium cyanescens, Leptogium corticola, Collema subfurvum, Collema conglomeratum, and Sticta weigelii) and lichens containing blue-green algae in cephalodia (Lobaria pulmonaria and Lobaria quercizans). Lichens with blue-green algae as primary phycobionts had higher nitrogen contents than Lobaria, perhaps due to a higher fixation rate. Collema conglomeratum had a lower nitrogen content, lower fixation rate, and was covered with apothecia. Most lichens with blue-green algae as their primary phycobiont fixed nitrogen more rapidly than lichens with algae incephalodia. Nitrogen contents/unit surface area were less variable than fixation data and were related to the thickness or lobe compactness. Lichens with many apothecia or blue-green algae in cephalodia had lower fixation rates/unit surface area. Fixation rates did not account for total thallus nitrogen replacement each year, but because of lichens' slow growth appeared to be adequate to account for thallus nitrogen. If the fixation rate is only equivalent to nitrogen in the thallus, reduced nitrogen will be added to the ecosystem when the lichen dies. (See also W76-10266) (Buchanan-Davidson--Wisconsin)

NUTRIENT LOSSES IN PARTICULATE FORM AS WEIR POND SEDIMENTS FROM FOUR UNIT WATERSHEDS IN THE SOUTHERN APPALACHIANS,
Georgia Univ., Athens. Dept. of Botany.
C. D. Monk.
In: 'Mineral Cycling in Southeastern Ecosystems,' 1975, (CONF-740513), p, 862-867. 2 tab., 6 ref. NSF AG-199, BMS69-01147.

Descriptors: *Vegetation effects, *Nutrients, *Sediments, *Erosion rates, *Watersheds(Basins), Appalachian Mountain Region, North Carolina, Hardwood, Pine trees, Forest management, Clays, Sands, Silts, Organic matter, Nitrogen, Calcium, Magnesium, Potassium, Sodium, Phosphorus, Annual, Weirs.
Identifiers: Coweeta Hydrologic Laboratory(NC).

Weir-pond sediments were collected at three-month intervals for two years from four watersheds with contrasting vegetation in the Coweeta Hydrologic Laboratory, North Carolina. Annual sediment losses were 283 kg/ha from the coppice hardwoods, 176 from old field, 76 from pine plantation, and 30 from mature hardwood watersheds. Sediment losses followed seasonal trends, with greater losses normally observed in winter. Sediment composition from old field, coppice hardwood forests, and pine plantation watersheds were similar, averaging 77.4% sand, 13.6% silt, 9.0% clay, and 7.6% organic matter. The same values for the mature hardwood forest were 49.9, 17.6, 32.5, and 21.9%. The order of concentration from high to low was nitrogen, calcium, magnesium, potassium, sodium, and phosphorus. Calcium, magnesium, potassium, and phosphorus showed no seasonal trends. Concentrations were generally lower in the coppice forest sediments. Nitrogen and sodium changed seasonally with highest concentrations in winter. Nitrogen concentrations were higher in forest sediments; calcium and magnesium losses were higher from the pine plantation and hardwood forest; and calcium and magnesium levels were high in old field watershed sediments. Total annual nutrient losses were less than 1% of the total loss. (See also W76-10266) (Buchanan-Davidson--Wisconsin).

CHANGES IN SOME HEMATOLOGICAL CHARACTERISTICS OF COHO SALMON (ONCORHYNCHUS KISUTCH) IN RESPONSE TO ACUTE EXPOSURE TO DEHYDROABIETIC ACID (DHAA) AT DIFFERENT EXERCISE LEVELS,
British Columbia Univ., Vancouver. Dept. of Zoology.
G. K. Iwama, G. L. Greer, and P. A. Larkin.
Journal of the Fisheries Research Board of Canada, Vol. 33, p. 285-289, 1976. 2 tab., 20 ref.

Descriptors: *Pulp wastes, *Industrial wastes, Laboratory tests, *Toxicity, *Cytological studies, Fish physiology, *Salmon, Biochemistry, Stress, Environmental effects, Water pollution effects, Salmonids, Methodology, Fish behavior, Mortality, Toxicants.
Identifiers: *Hematology, *Dehydroabietic acid(DHAA), Exercise levels(Fish), Oncorynchus kisutch, Sublethal effects.

To determine if changes in some hematological parameters accompanied acute exposure of juvenile coho salmon (Oncorhynchus kisutch) to dehydroabietic acid (DHAA) at three different exercise levels, clotting times, hematocrits, erythrocyte sedimentation rates, red blood cell counts, and white blood cell counts were monitored over 6-, 12-, 24-, and 48-h exposure periods to 0.75 mg/liter DHAA. White cell counts decreased significantly after 24 h exposure and there was a significant increase in clotting times after 48 h exposure to DHAA. In both cases, differences between experimentals and controls were significant only at low and intermediate exercise levels, and not at the high exercise level. Hematocrits, erythrocyte sedimentation rates, and red blood cell counts were not significantly different between experimentals and controls for any of the exposure periods or exercise levels. (Katz)
W76-10333

A COMPARISON OF TRACE-METAL AND METALLOENZYME PROFILES IN DIFFERENT MOLLUSCS AND DURING DEVELOPMENT OF THE OYSTER,
Institute of Marine Biochemistry, Aberdeen(Scotland).
P. G. George, and T. L. Coombs.
In: Proceedings 9th European Marine Biology Symposium, p. 433-450, 1975. 11 fig., 3 tab., 24 ref.

Descriptors: *Enzymes, *Molluscs, *Immature growth stage, Manganese, Animal physiology, Biochemistry, *Trace elements, *Oysters, Zinc, Mussels, *Absorption, Copper, Iron, Larval growth stage, Crustaceans, Invertebrates, Metals, Metabolism, Water pollution effects, Methodology, Analytical techniques, Environmental effects.
Identifiers: Mytilus sp., Haliotis sp., Cardium sp.

The possibility of correlations between the trace-metal distribution and biochemical function in four species of molluscs from different habitats was investigated. Neither oyster larvae nor young spat were able to concentrate zinc; this ability developed between 50 and 100 days after settlement, and although it coincided with a general increase in zinc-metalloenzyme activity it could not be correlated with the ability to survive anaerobiosis because adult Mytilus does not contain high tissue zinc concentrations. The zinc-dependent digestive hydrolase enzymic activities are correlated with the dietary components. Malate dehydrogenase enzymic activity is very much greater than that of lactate dehydrogenase for the four species investigated. Lactate dehydrogenase activity is correlated with different muscular activity between species and during development of the oyster. Malate dehydrogenase activity is increased in oyster larvae when stored fat is metabolized. (Katz)
W76-10334

ACUTE TOXICITY OF SODIUM CHLORIDE, PENTACHLOROPHENOL, GUTHION(R), AND HEXAVALENT CHROMIUM TO FATHEAD MINNOWS (PIMEPHALES PROMELAS) AND GOLDFISH (CARASSIUS AURATUS),
Minnesota Univ., St. Paul. Dept. of Entomology, Fisheries and Wildlife.
I. R. Adelman, L. L. Smith, Jr., and G. D. Siesennop.
Journal of the Fisheries Research Board of Canada, Vol. 33, p. 203-208, 1976. 2 fig., 12 ref.

Descriptors: Resistance, *Pesticides, *Minnows, *Bioassay, *Chromium, *Toxicity, *Lethal limit, *Phenols, *Sodium chloride, *Industrial wastes, *Mortality, Toxicants, Laboratory tests, Water pollution sources, Methodology, Chlorinated hydrocarbon pesticides, Fish physiology.
Identifiers: Pimephales promelas, Carassius auratus, *Guthion(R), Pentachlorophenol, *Goldfish.

The 96-h LC50's for sodium chloride were 7650 and 7341 mg/liter, for pentachlorophenol 0.21 and 0.22 mg/liter, for Guthion(R) 1.9 and 2.4 mg/liter, and for hexavalent chromium 48 and 120 mg/liter, for fathead minnows (Pimephales promelas) and goldfish (Carassius auratus), respectively. Threshold LC50's were reached in 6 days for sodium chloride (7650 and 7322 mg/liter for fathead minnows and goldfish, respectively), and pentachlorophenol (0.21 and 0.21 mg/liter), but were not attained in 11 days (termination of testing) with Guthion(R) (0.76 and 0.80 mg/liter)and hexavalent chromium (18 and 33 mg/liter). With pentachlorophenol and Guthion(R) goldfish were initially more resistant, but by termination there was no significant difference in LC50's between the two specis. With hexavalent chromium the goldfish were more resistant throughout the 11-day test, and with sodium chloride goldfish were initially more resistant but at attainment of a threshold LC50 were less resistant. Use of toxicity curves for assessment of acute mortality permits interpretation not possible in 96-h tests where LC50's are computed at 24-h intervals. (Katz)

THE EFFECT OF IN VIVO CHROMIUM EXPOSURE ON NA/K- AND MG-ATPASE ACTIVITY IN SEVERAL TISSUES OF THE RAINBOW TROUT (SALMO GAIRDNERI),
Cleveland Metropolitan General Hospital, Ohio. Dept. of Obstetrics and Gynecology.
R. M. Kuhnert, B. R. Kuhnert, and R. M. Stokes.
Bulletin of Environmental Contamination and Toxicology, Vol. 15, No. 4, p. 383-390, 1976. 2 tab., 1 fig., 19 ref.

Descriptors: *Enzymes, Biochemistry, Inhibitors, *Rainbow trout, Laboratory tests, *Chromium, *Bioassay, *Fish physiology, Metals, Water pollution effects, Environmental effects, Absorption, Analytical techniques, Methodology, Spectrophotometry.
Identifiers: *ATPase, Tissue analysis, Sublethal effects, Bioaccumulation.

The effect of in vivo chromium exposure on Na/K- and Mg-ATPase activity was studied in several tissues of the rainbow trout, Salmo gairdneri. Those tissues studied were: intestine, gill, liver, and kidney. Tissue chromium levels were determined for control rainbow trout and trout exposed to 2.5 mg Cr/l (as chromate) for 48 hours. After exposure to chromium, inhibition of Na/K-ATPase activity, but not Mg ATPase activity, was observed. These results may partially explain the detrimental effects of hexavalent chromium on fish. (Katz)
W76-10337

DELTA-AMINO LEVULINIC ACID DEHYDRATASE ACTIVITY IN FISH BLOOD AS AN INDICATOR OF A HARMFUL EXPOSURE TO LEAD,
Canada Centre for Inland Waters, Burlington (Ontario).
P. V. Hodson.
Journal of the Fisheries Research Board of Canada, Vol. 33, p. 268-271, 1976. 1 fig., 10 ref.

Descriptors: *Lead, *Enzymes, Biochemistry, Methodology, *Rainbow trout, *Inhibitors, Water quality control, *Bioindicators, Public health, Laboratory tests, *Pollutant identification, Water pollution effects, Heavy metals, Fish physiology, Analytical techniques.
Identifiers: *Sublethal effects.

The activity of red cell D-amino levulinic acid dehydratase of rainbow trout (Salmo gairdneri) was depressed after exposure of the fish to lead. Concentrations of lead in water as low as 13 micrograms/liter caused a significant inhibition of activity after only 4-wk exposure. Assays of this enzyme's activity may provide a short-term indication of long-term harmful effects of lead. (Katz)
W76-10338

EFFECTS OF POWER-PLANT COOLING SYSTEMS ON MARINE PHYTOPLANKTON,
California Univ., Irvine. Dept. of Environmental Biology.
F. J. P. Briand.
Marine Biology, Vol. 33, No. 2, p 135-146, 1975. 4 tab., 10 fig., 53 ref.

Descriptors: *Temperature, *Mortality, Powerplants, *Cooling water, *Diatoms, *Phytoplankton, *Dinoflagellates, *Heated water, Plant populations, Aquatic populations, *Primary productivity, Cooling, Marine microorganisms, Algae, Biological communities, Dominant organisms, Seasonal, Chlorination, *Thermal pollution, Water pollution effects.
Identifiers: *Species diversity.

The large quantities of marine phytoplankton passing through the cooling systems of two Southern California coastal power plants were found to be greatly reduced in numbers (41.7%) and in volume (33.7%). Phytoplankton mortalities were most pronounced from October to December when intake waters of 17 to 20 C were subjected to temperature elevations of 9 to 11 C, and were lowest from January to March when cooler ambient temperatures prevailed. There was no apparent reduction in phytoplankton stocks when the intake water was cooler than 15 C. Surviving cells in 25 and 26.5 C effluent waters grew three times faster than influent populations, which suggests the short-term effects of power-plants on phytoplankton. Entrainment effects are very disruptive to the structure of phytoplankton communities and in reducing species diversity. Passage through the condenser tubes affected algal species differentially, killing diatoms in greater numbers than dinoflagellates. On this basis, use of deep-sea water by coastal power plants for cooling is advocated. (Katz)

AROCLOR 1016: TOXICITY TO AND UPTAKE BY ESTUARINE ANIMALS,
Environmental Protection Agency, Gulf Breeze, Fla. Gulf Breeze Environmental Research Lab.
D. J. Hansen, P. R. Parrish, and J. Forester.
Environmental Research, Vol. 1, p. 363-373, 1974. 5 tab., 4 fig., 8 ref.

Descriptors: *Cytological studies, Pathology, *Mortality, Retention, *Aroclor, *Polychlorinated biphenyls, Oysters, Shrimp, *Bioassay, *Toxicity, *Lethal limit, *Absorption, *Brackish water fish, Pesticides, Benthic fauna, Invertebrates, Shellfish, Fish diseases, Laboratory tests, Water pollution effects, Path of pollutants, Pesticide residues, Microscopy, Chromatography.
Identifiers: Bioaccumulation, Lagodon sp., Sublethal effects, Penaeus sp., Palaemonetes sp., *Pinfish, *Tissue analysis, Brown shrimp.

Bioassays were conducted to determine the acute toxicities of the polychlorinated biphenyl (PCB) Aroclor 1016 in flowing sea water to American oysters (Crassostrea virginica), brown shrimp (Penaeus aztecus), grass shrimp (Palaemonetes pugio), and pinfish (Lagodon rhomboides), and to determine its toxicity to, and uptake and retention by pinfish. Acute 96-hr LC50's were: oysters, 10.2 micrograms/1; brown shrimp, 10.5 micrograms/1; grass shrimp, 12.5 micrograms/1. The PCB was not toxic to pinfish at 100 micrograms/1 for 96-hr, but significant mortality occurred when pinfish were exposed to 32 microgram/1 of Aroclor 1016 for 42 days. Pinfish exposed to 1 microgram/1 for 56 days accumulated the chemical to 17,000 x the nominal concentration in test water. Pathologic tissue alterations occurred in pinfish exposed to 32 microgram/1 of Aroclor 1016 for 42 days. (Katz)

Descriptors: *Stoneflies, *Mayflies, *Bioassay, *Aquatic insects, *Cadmium, *Absorption, *Lethal limit, *Mortality, *Toxicity, Insects, Laboratory tests, Invertebrates, Path of pollutants, Water quality control, Water pollution effects, Metals, Industrial wastes.
Identifiers: Bioaccumulation, Ephemerella sp., Pteronarcella sp.

Continuous-flow bioassays were employed to determine 96-hr median tolerance limits (TLm) for the stonefly, which had a TLm value of 18.0 mg Cd/1, and the mayfly, which had a TLm value of 28.0 mg Cd/1. Ninety-six hour TLM values for other species of aquatic insects tested were not determined since these species were relatively insensitive to cadmium. Insects exposed for four days to cadmium-containing water, then placed in clean water, show a linear rate of cadmium loss. This loss may lower or prevent mortality under ideal conditions. (Katz)
W76-10342

PIKES (ESOX LUCIUS L.) SHOWN TO BE AFFECTED BY LOW PH VALUES DURING FIRST WEEKS AFTER HATCHING,
Uppsala Univ., (Sweden). Inst. of Zoology.
N. Johansson, and J. E. Kihlstrom.
Environmental Research, Vol. 9, p. 12-17, 1975. 4 fig., 4 tab., 9 ref.

Descriptors: *Hydrogen ion concentration, *Mortality, *Juvenile growth stage, Fry, *Pikes, Movement, *Fish behavior, Fish physiology, Reproduction, Water quality, Environmental effects, Freshwater fish, Hatching, Fish reproduction.
Identifiers: Esox sp.

New hatched pike (Esox lucius) sac fry from artificially fertilized eggs were reared for eight days in water solutions with pH values ranging from 4.0 to 7.2. The mortality was 17% t pH 6.8, 26% at pH 5.0, and 97% at pH 4.2. Sac fry reared at pH 4.2 showed a less rapid development than those raised at pH 5.2 and 6.8, and showed a lesser degree of mobility. (Katz)

SYNERGISM BETWEEN DISSOLVED OXYGEN AND CADMIUM TOXICITY IN FIVE SPECIES OF AQUATIC INSECTS,
Utah Univ., Salt Lake City. Dept. of Biology.
R. W. Clubb, A. R. Gaufin, and J. L. Lords.
Environmental Research, Vol. 9, p. 285-289, 1975. 1 fig., 3 tab., 18 ref.

Descriptors: *Bioassay, *Aquatic insects, *Cadmium, *Metabolism, *Absorption, *Dissolved oxygen, Insects, *Toxicity, *Mortality, Environmental effects, Diptera, Mayflies, Stoneflies, Caddisflies, Laboratory tests, Analytical techniques, Invertebrates, Toxicants, Metals, Oxygen.
Identifiers: *Synergistic effect(Insects).

Continuous-flow bioassays were employed to determine the relationship between dissolved oxygen and cadmium in five species of aquatic insects, as measured by survival and the amount of cadmium found within the insect. Results indicate the toxicity of cadmium increases as the dissolved oxygen concentration increases. This may be explained by an observed increase in the amount of cadmium found in the insect as the dissolved oxygen concentration increases. Oxygen consumption has been reported to increase as the dissolved oxygen concentration increases. In this study, using a fixed cadmium concentration, the amount of cadmium found in the insect also increaded with an increase in the dissolved oxygen. Therefore, cadmium absorption may be coupled to metabolism. (Katz)
W76-10345

THE INFLUENCE OF HARDNESS COMPONENTS (CA2+ AND MG2+) IN WATER ON THE UPTAKE AND CONCENTRATION OF CADMIUM IN A SIMULATED FRESHWATER ECOSYSTEM,
Northeast Louisiana Univ., Monroe. Dept. of Biology.
M. L. Kinkade, and H. E. Erdman.
Environmental Research, Vol. 10, p. 308-313, 1975. 2 fig., 1 tab., 5 ref.

Descriptors: *Hardness(Water), *Cadmium, *Calcium, *Magnesium, Ecosystems, *Cadmium radioisotipes, *Tracers, *Algae, *Catfish, Aquatic plants, *Snails, *Absorption, Environment effects, Laboratory tests, Water quality, Chemical properties, Analytical techniques, Freshwater fish, Pollutant identification.
Identifiers: Bioaccumulation, *Elodea.

Members of a simulated freshwater ecosystem, an alga, a rooted plant, infusoria snails, catfish and guppies were cultured together for 1 to 12 hours and from 1 to 21 days in hard water (total Ca2+ and Mg2+ approximately 150 ppm) or soft water (total Ca2+ and Mg2+ 0 ppm) containing one initial concentration of 0.1 ppm Cd-115. At the end of each of the 10 different exposure periods, specimens of each species were evaluated for cadmium content. The amount of radioactivity indicated that the initial rate of Cd uptake by the organisms was faster in hard water than in soft water. However, the total concentration of Cd was greater in those organisms cultured in soft water than those in hard water. (Katz)
W76-10346

INCORPORATION OF 203HG INTO METHYLMERCURY IN FISH LIVER: STUDIES IN BIOCHEMICAL MECHANISMS IN VITRO,
Wisconsin Univ., Madison. Dept. of Entomology.
F. Matsumura, Y. Gotoh Doherty, K. Furukawa, and G. M. Boush.
Environmental Research, Vol. 10, p. 224-235, 1975. 2 fig., 7 tab., 12 ref.

Descriptors: *Mercury, Biochemistry, *Fish physiology, *Inhibitors, *Tracers, Laboratory tests, Heat, *Irradiation, Metals, Path of pollutants, Metabolism, Salmon, Methodology, Analytical techniques.
Identifiers: *Methylmercury, *Tune, Methylation, Livers.

Livers of all fish species studied, particularly pelagic species, were capabe of transforming mercuric ion into methylmercury in vitro. The factors involved in the process of methylmercury formation from Hg2+ ion in the fish liver were studied. The methylation activities wer not destroyed by either heat or ultraviolet and visible light irradiation treatments. It was thus concluded that the reaction(s) studied here was not mediated by methylcobalmine. Mersalyl, an SH inhibitor, could, however, abolish most of the methylation reaction. (Katz)
W76-10347

TOXICITY OF POLYDIMETHYLSILOXANES IN CERTAIN ENVIRONMENTAL SYSTEMS,
Dow Corning Corp., Midland, Mich.
E. J. Hobbs, M. L. Keplinger, and J. C. Calandra.
Environmental Research, No. 10, p. 397-405, 1975. 3 tab., 14 ref.

Descriptors: *Reproduction, *Degradation(Decomposition), *Biodegradation, *Adsorption, *Industrial wastes, *Toxicity, *Absorption, *Carbon radioisotopes, Tracers, *Bioassay, *Lethal limit, *Rainbow trout, *Sunfishes, Water pollution sources, Water pollution effects, Methodology, Analytical techniques, Laboratory tests, Daphnia, Freshwater fish, Marine fish, Mortality, Mallard duck, Poultry.
Identifiers: *Polydimethylsiloxanes, *Silicones.

Selected polydimethylsiloxane (PDMS) fluids and formulations were studied in certain biological systems to evaluate the possible environmental impact of these materials. These siloxanes are not detectably degraded by sewage microorganisms as shown in a study with marked PDMS. The very low toxicity of these materials to daphnia, freshwater fish, marine species, mallard ducks, bobwhite quail and domestic chicken, and their non-accumulation in the flesh and eggs of chickens and in the flesh of fish minimizes concern regarding their potential to cause environmental damage. (Katz)
W76-10348

STANDARDIZATION OF THE CONTENT OF BENZO(A)-PYRENE IN WATER BODIES, (IN RUSSIAN),
Kiev Research Inst. of General Communal Hygiene (USSR).
N. Ya. Yanysheva, Ya. I. Kostovetskii, and Z. P. Fedorenko.
Gig Sanit. 7, p 71-75, 1974.

Descriptors: *Organic compounds, Standards, Water pollution effects, Diseases.
Identifiers: *Carcinogens, Tumors, *Benzopyrene.

For standardizing the content of benzo(a)pyrene in water bodies, data on the blastomatogenic activity of various doses of this carcinogen following its oral introduction into the gastrointestinal tract of mice were obtained. A graph of the dependence of the frequency of stomach tumors on dose of the carcinogen was plotted. The maximum allowable concentration of benzo(a)pyrene in water bodies was determined by an equation taking into account the ratio of animal and human body weight, safety factor, and volume of water consumed by a person during his life. The maximum allowable concentra-

LIBRARY OF THE UNIVERSITY OF

tion of benzo(a)pyrene in water bodies should not exceed 0.0004 micro-g/1.--Copyright 1975, Biological Abstracts, Inc.

A DISCUSSION OF THE EFFECTS OF CERTAIN POTENTIAL TOXICANTS ON FISH AND SHELLFISH IN THE UPPER DELAWARE ESTUARY,
Delaware Univ., Newark.
A. Scheier, and P. Kiry.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-231 423, $4.50 in paper copy, $2.25 in microfiche. Academy of Natural Sciences of Philadelphia, Penn., December, 1973, 50 p, 7 tab., 1 fig.

Descriptors: Delaware, *Delaware river, *Estuaries, *Estuarine environment, *Toxicity, *Metals, Shellfish, Estuarine fisheries, Brackish water fish, Aquatic habitat, Water pollution effects, Marine fish, Freshwater fish, Environmental effects, Zinc, Iron, Nickel, Magnesium, Cadmium, Copper, Chromium, Manganese, Lead, Aluminum, Mercury.
Identifiers: *Delaware River Estuary System, Upper Delaware Estuary.

The purpose is to set forth the potential toxicants in the Upper Delaware Estuary and to determine whether their concentrations are sufficient to contribute to the reduction of fish and shellfish species in the Upper Estuary. A list of species historically found in the Upper Delaware Estuary serves as a baseline for comparison with species lists recently compiled during surveys of the Upper Estuary. A summary of the maximum concentrations of metals found in the Upper Estuary is presented, along with recommended safe concentrations. Of the ten potentially toxic substances listed, at least nine occur in sufficient quantity to contribute to lethal effects. Many of these ions occur fairly equally throughout the Upper Estuary, but the highest concentrations are, in general, found in the most industrialized and urbanized areas of the Upper Estuary. Investigation of available data concerning the effects of potential toxic ions upon fish and shellfish in the Upper Estuary leads to the conclusion: much more information must be generated before intelligent and rational policies for the future use of the Upper Estuary can be formulated. (Katz)

PROCEEDINGS OF THE CONFERENCE ON MARINE BIOLOGY IN ENVIRONMENTAL PROTECTION HELD AT SAN CLEMENTE ISLAND, CALIFORNIA ON 13-15 NOVEMBER, 1973.
Naval Undersea Center, San Diego, Calif.
Available from the National Technical Information Service, Springfield, Va 22161 as AD/A-004 606, $7.50 in paper copy, $2.25 in microfiche. Report NUC TP 443, Published December, 1974, 187 p.

Descriptors: *Marine biology, *Environmental control, *Environmental engineering, *Enzymes, Bioassay, Toxicity, Marine algae, Annelids, Mollusks, Fish physiology, Water analysis, Fish diseases, Statistical methods, Fouling, Aquatic algae, California, *Sea water, Pollutant identification, Water pollution effects, Path of pollutants.
Identifiers: Southern California.

Short presentations were made on the following topics: the fouling community as a field monitoring technique; problems and techniques of marine biology in the field; systematic analysis of field survey techniques; the systems concept and pollution control; and the need for more intercomparable field data and widely applicable, short-term survey techniques. Papers were presented on the following topics: biological consideration of a bioassay system; a reliable algal assay procedure based on pH measurements; the sublethal effects of pollutants on polychaetous annelids; byssal thread production as a toxicity test; the activities of enzymes as pollution indicators; chemical problems encountered in toxicity studies; antifouling coatings and their influence on the marine environment; disease responses in southern California coastal fishes; and comparison of marine toxicity tests. THE FOULING COMMUNITY AS A FIELD MONITORING TECHNIQUE,
Naval Ship Research and Development Center, Annapolis, Md.
E. C. Fischer.
In: Proceedings of the Conference on Marine Biology in Environmental Protection, on 13-15 November, 1973. December, 1974. p 7-17.

Descriptors: *Fouling, *Aquatic algae, *Aquatic plants, *Periphyton, Water pollution effects, Marine biology, Monitoring, Data collections, On-the-site investigations, Water quality, *Pollutant identification.
Identifiers: *Fouling racks, *Fouling plates.

Environmental biologists need an accurate, sensitive and economical technique for evaluating water quality over a period of time. The fouling community may contain valuable information which reflects ambient water quality. The use of fouling accretion panels placed in areas of heavy Navy activity is proposed as a standard field technique for environmental quality measurement by Navy laboratories. (See also W76-10353) (Katz)

PROBLEMS AND TECHNIQUES OF MARINE BIOLOGY IN THE FIELD: MODELING THE MARINE ECOSYSTEM,
California Univ., Davis. Dept. of Civil Engineering.
G. T. Orlob.
In: Proceedings of the Conference on Marine Biology in Environmental Protection, held at San Clemente Island, California on 13-15 November, 1973, December, 1974, p. 19-30, 1 tab, 1 fig, 15 ref.

Descriptors: *Marine biology, *Estuarine environment, Methodology, *Model studies, *Simulation analysis, *Mathematical models, Ecosystems, Bays, *Monitoring, Marine sediments, Water quality, California.
Identifiers: *Sediment modeling, San Diego outfall(Calif).

The art of mathematical modeling of aquatic systems has advanced rapidly during the past several years to the point where it is now being usefully applied in comprehensive studies of the marine environment. Investigations of circulation, sediment transport, heat exchange, water quality, and even marine ecosystems, are now facilitated through the use of models. Examples of current interest include studies of San Francisco Bay, Monterey Bay, the ocean outfall near San Diego, Puget Sound, and the New York Bight. In each of these studies, except that of the San Diego outfall, mathematical models have figured prominently as tools for environmental impact assessment and decision making. The San Diego case is of special interest because of the elaborate program set up by the San Diego Water Quality Control Board to monitor the impact of waste discharge on the marine environment, including marine benthic organisms in the region of the outfall. BIOLOGICAL CONSIDERATION OF A BIOASSAY SYSTEM,
Naval Ship Research and Development Center, Annapolis, Md.
G. L. Liberatore.
In: Proceedings of the Conference on Marine Biology in Environmental Protection, held at San Clemente Island, California, on 13-15 November, 1973, December, 1974, p 59-70, 6 tab, 7 ref.

Descriptors: *Bioassay, *Toxicity, Fish, Molluscs, Algae, Bacteria, Crustaceans, *Laboratory animals, Cadmium, *Marine animals, Methodology, Metals, Water analysis, Chesapeake Bay, Pollutant identification.
Identifiers: *Descaling agents, *Antifouling agents.

Seven different organisms, mostly indigenous to Chesapeake Bay, have been chosen to determine the LC50 (lethal concentration, 50 percent) with various chemicals. The bioassay system is a closed, one chemical dump or spill situation. Descaling, antifouling agents, and some metals have been used. The procedures have been constantly reviewed and revised with the aim that they should; (a) yield more statistical data, (b) reduce the time and workload, (c) approach the loading capacity of the system and (d) reflect the nature and life style of the organisms. None of the descaling agents were toxic, while the proposed antifouling agents ranged in toxicity from 1 ppm for fish to 50+ ppm for the oyster. The barnacle was the most sensitive to cadmium, while the fish was the least. The text of this presentation is divided into two phases: (a) brief description of the bioassay system in our laboratory at Annapolis and (b) some biological considerations of this system. DISEASE RESPONSES IN SOUTHERN CALIFORNIA COASTAL FISHES,
Southern California Coastal Water Research Project, El Segundo.
M. J. Sherwood, and A. J. Mearns.
In: Proceedings of the Conference on Marine Biology in Environmental Protection, held at San Clemente Island, California, on 13-15 November, 1973, December, 1974, p. 147-162, 3 tab, 8 fig., 4 ref.

Descriptors: *Marine fish, *Water pollution effts, Pathology, *Toxicity, *Marine fisheries, *California, *Fish diseases, Waste water disposal, Parasitism, Effluents, Sewage effluents, Sea water, Bays.
Identifiers: *Fin erosion, Dover sole, Microstomus pacificus, Tuna, Santa Monica Bay(Calif), San Pedro Bay(Calif), Los Angeles(Calif).

The nearshore demersal fish communities of southern California have been extensively monitored by public and private agencies since 1969. The Southern California Coastal Water Research Project has assembled and analyzed much of the data in order to evaluate the health of local populations. One approach has been to investigate the frequency of diseased or anomalous specimens. Diseases with external symptoms may be easily observed and quantified in the field, and the presence of diseased individuals in a given habitat may be indicative not only of the health of the population but also of an imbalance in the community. A number of disease conditions were recorded during the trawl surveys. Of these, only fin erosion in the Dover sole (Microstomus pacificus) appeared to be directly related to wastewater discharge sites. At present, there are no direct links between the identifiable field effect and the suspected causes. A laboratory program has been designed to determine the role of microorganisms and physical/chemical factors in the disease response. (See also W76-10353) (Katz)

COMPARISON OF TOXICITY TESTS,
Naval Undersea Center, San Diego, Calif.
P. R. Kenis.
In: Proceedings of the Conference on Marine Biology in Environmental Protection, held at San Clemente Island, California, on 13-15 November, 1973, December, 1974, p. 163-180, 3 tab., 52 ref.

Descriptors: *Toxicity, *Bioassay, *Water pollution effects, Water quality standards, *Monitoring, Standards, Laboratory animals, Data collections, Measurement, Variability, Domestic wastes, Industrial wastes, *Bioindicators, Statistical analysis, Marine organism, Pollutant identification.
Identifiers: Acceptable concentration limits, Acute response, Chronic response, Maximum Acceptable Toxic Concentration(MATC), Application factor, TLm, Comparison of toxicity data.

The assessment of water quality using living organisms is an integral part of most water quality monitoring programs. Toxicity test data provide a basis from which to control discharged waste in receiving waters and to predi pct the impact evoked by the discharge. Toxicity tests are performed on chemicals or particulate matter known to be in waste effluents. This information can be used to establish acceptable concentration limits for the various pollutants and develop water quality standards. (See also W76-10353) (Katz)

CHANGES IN THE LEVELS OF ENVIRONMENTAL POLLUTANTS (HG, DDT, DIELDRIN, PCB) IN SOME SWEDISH FOODS,
National Swedish Food Administration, Stockholm. Food Lab.
G. Westoo.
Ambio, Vol. 3, No. 2, p. 79-83, 1974. 2 tab., 8 fig., 16 ref.

Descriptors: *Pesticide residues, *Public health, *Dieldrin, *Industrial wastes, *Mercury, *Foods, *DDT, *Polychlorinated biphenyls, Fish, Legislation, Pulp wastes, Chlorinated hydrocarbon pesticides, Path of pollutants, Pollutants, Toxicants, Food webs, Food chains, DDE, Distribution, Water pollution effects.
Identifiers: *Sweden.

Regulations have been issued by Swedish authorities in order to diminish the use of certain pesticides and other toxic compounds found as pollutants in the environment. The effects of the measures can be observed as decreasing levels of pollutants in certain foods. Mercury levels in Swedish foods of animal origin such as meats, eggs and liver decreased to roughly 1/3-1/6 early levels. Mercury levels in fish have also decreased in areas downstream from several wood pulp and paper pulp industries, but no decrease has been observed in the vicinity of chlorine-alkali industries. DDT in human milk has also decreased, but levels of PCB seem to have increased in the past few years. (Katz)

LOW THERMAL RESPONSIVENESS IN THE BLUEGILL, LEPOMIS MACROCHIRUS,
Wisconsin Univ., Madison. Lab. of Limnology.
T. L. Beitinger, and J. J. Magnuson.
Journal of the Fisheries Research Board of Canada, Vol. 33, p. 293-295, 1976. 7 ref.

Descriptors: *Sunfishes, Temperature, *Fish behavior, *Mortality, *Heated water, *Water temperature, Freshwater fish, Laboratory tests, Thermal water, Seasonal, Lethal limit, Aquatic environment, Environmental effects, Diurnal, *Thermal pollution, Water pollution effects.
Identifiers: Lepomis machrochirus, Thermal responsiveness, Acclimation.

Fifteen young bluegill, Lepomis macrochirus, acclimated to 5C for at least 1 mo, died during temperature preference testing owing to apparent voluntary exposure to high temperatures. The mortality rate of 100% for these fish greatly exceeded the 3.8% rate found for 262 bluegill acclimated to temperatures ranging from 20 to 34C, and tested in the same apparatus. Modifications in the experimental design whereby fish acclimated to 5C were held at about 19C for 24 h during testing, enabled all fish to survive. These bluegill selected temperatures only 2C lower than those acclimated to summer conditions. (Katz)

B. P. Butz, A. Policastro, J. J. Reisa, Jr., D. R. Schregardus, and B. A. Lewis.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-235 227, $10.75 in paper copy, $2.25 in microfiche. Report EPA-905/9-74-004, June, 1974, 385 p., 36 tab., 102 fig.

Descriptors: *Aquatic biology, *Cooling water, *Ohio River, *Heated water, *Water pollution effects, *Thermal pollution, *Analytical techniques, Water pollution sources, Hydrothermal studies, Thermal power, Water temperature, Thermal stress, Biological effects, Hydrologic modeling, Freshwater fish.
Identifiers: Thermal regime, Thermal plume analysis, Thermal models, COLHEAT, STREAM, Edinger-Geyer, Temperature prediction, Model evaluation, Plume physics, Boundary effects.

This study presents a review and critique of existing technical information relevant to the environmental effects of the use of the Ohio River main stem for cooling. In order to evaluate the effect of heat discharges on the indigenous aquatic life of the Ohio River, an extensive review and critique of past and existing studies dealing with the biological aspects of cooling water was undertaken. In order to judge the effect of heat discharges on the thermal regime of the river, three one-dimensional river temperature prediction models - COLHEAT, STREAM and Edinger-Geyer were evaluated, and the most appropriate model was selected to analyze changes in temperature distribution along the river. The effects of heat discharges on the thermal regime of the river near the points of discharge were evaluated by analyzing and critiquing available thermal plume study results. (Katz)

Proceedings of the Royal Australian Chemical Institute, Vol. 43, No. 2, p 51-53, February, 1976. 1 fig, 11ref.

Descriptors: *Sludge analysis, *Sludge treatment, *Sewage sludge, Organic compounds, Suspended solids, Waste disposal, Filtration, Sedimentation, *Waste water treatment.

Waste discharges of finely divided solids suspended in water are usually treated by coagulation and settling, but not all suspensions settle out readily. Although inorganic slurries sometimes cause problems, orgaic sludges, such as those produced from sewage, textile processing, or the food industry, are always difficult to dewater. These pose a serious problem since they usually are produced in populous areas. However, quantities of these sludges are much smaller than those of inorganic sludges from mining. Due to the smaller quantities, sedimentation can be supplemented with filtration and other more costly processes. Organic sludges' main components are crosslinked natural hydrophilic polymers, such as proteins or carbohydrates. Probably stabilization is due largely to a sort of inbuilt 'stearic stabilization', and charge has a less important role. The only practical way of inducing this kind of colloid to settle is some type of flocculation. Most of the troublesome sluges are already flocculated, but the sediment is a more or less structured gel retaining a large amount of water. Mechanically breaking the structure enables more water to be removed from the sediment. The sediments are usually compressible, and higher solids contents will result under loading from deep beds. This loading effect also benefits filtration. (Snyder-FIRL)

USE OF HIGH LEVEL RADIATION IN WASTE TREATMENT--STATUS AND PROSPECTS,
International Atomic Energy Agency, Vienna (Austria). Div. of Life Sciences.
S. Kobayashi.
Atomic Energy Review, Vol. 13, No. 3, p 615-621, September, 1975.

Descriptors: *Sewage treatment, *Waste water treatment, *Irradiation, Cost-benefit analysis, Pilot plants, Waste treatment, Cost analysis.
Identifiers: *Ionizing radiation.

A symposium was held in March, 1975, on the application of high level radiation to waste treatment. Discussion included treatment and reuse of waste water, radiosensitivity of microorganisms, disinfection and microbiological control, chemical and physical modification of aqueous pollutants, economic and technological considerations, pilot-plant design and operating experience, and radiation treatment of non-liquid wastes. Ionizing radiation, possibly combined with other treatment methods, is useful in solving problems of waste treatment and reuse of spent resources. Several methods of increasing the cost-effectiveness of microbiological control are discussed. While the use of ionizing radiation to decompose aqueous pollutants has advantages, its yield is generally too low to compete successfully with other methods. There is still disagreement about the choice of radiation source, and cost-benefit considerations are still unclear. Several pilot plants using radiation treatment are already operating, and it is expected that commercial plants will soon be built. Recommendations included study of the surface properties of suspended sewage particles and their reaction with radiolytic species, reporting of end products and pollutional effects when pollutants are treated by radiation, further study of the natural resistance of microorganisms to radiation, and an experimental protocol for study of radiation treatment of sludge and waste water. CHLORINE LOOKS SECURE AS WATER REAGENT.
Canadian Chemical Processing, Vol. 60, No. 3, p 28-29, March, 1976.

Descriptors: *Chlorine, *Disinfection, *Toxicity, Aeration, Lagoons, Pilot plants, Gamma rays, *Waste water treatment, Chlorination, Costs.
Identifiers: Dechlorination.

Unwanted contaminants may be introduced into the environment by water disinfection with chlorine. Water chemists suspect that some of the chloro-compounds that persist in nature are generated during water disinfection. Industry and agriculture do not account for all the chloro materials released to the environment. Primary effluent is usually toxic to fish; unchlorinated secondary effluent is nontoxic; and either stream containing 0.1 mg/liter residual chlorine is toxic for several hr, depending on water aeration. The chlorine residual is soon lowered to below the toxic threshold, 0.02 mg/liter, by lagooning/aeration. Use of a reducing agent, such as sulfur dioxide, to treat the chlorinated water also neutralizes the residual chlorine. When chlorine is added to effluent, it reacts to form several compounds including chloramines, which reduce coliform bacteria counts and are toxic to fish. Treatment with sulfur dioxide decomposes the chloramines and renders the water nontoxic. Chlorination costs about 7 cents/Imperial gal, and dechlorination would add another cent/1000 Imperial gal. A pilot unit disinfecting waste water with gamma rays was compared with a chlorination unit of similar size. The gamma irradiator performed well and had no 'gross interaction with the waste water' other than its biocidal action. Costs for gamma radiation to produce disinfection similar to that produced by chlorine have been estimated at 64 cents/1000 gal. Gamma radiation will probably not be used to treat waste water unless this cost is drastically reduced. (Snyder-FIRL)

BENEFICIAL EFFECTS OF BAKING SODA ADDED TO SEPTIC TANKS,
Septic Tank Systems, Berkeley, Calif.
J. H. T. Winneberger, and M. S. Weinberg.
Journal of Environmental Health, Vol. 38, No. 5, p 322-326, March-April, 1976. 2 fig, 2 tab, 12 ref.

Descriptors: *Septic tanks, *Chemical precipitation, *Suspended solids, *Domestic wastes, *Waste water treatment, *Flocculation, Sodium compounds.
Identifiers: *Baking soda additives.

Additives for septic tanks are discussed. Septic tanks are not generally designed for efficient operation, but dead zones could provide for gradual release of chemical additives. Experiments with fresh water in salt-water filled models showed that intermittent addition could be effec-

tive. Chemicals were also added to the water entering two actual septic tanks of different sizes; one had been cleaned recently. Their liquid volumes had considerablr hydraulically less active zones which could store suspended or dissolved additives and exchange them slowly with active zones. Cationic flocculants increase flocculation, but in excessive amounts, can increase suspended solids. Experiments adding varied amounts of flocculant to raw sewage showed that an optimum amount of flocculant exists at which maximum removals of suspended solids occur. Due to their rather narrow effectiveness range, cationic polymers could cause problems as septic tank additives, due to varying septic tank sizes and the tendency of some homeowners to add more than the recommended quantities. Baking soda is being added to septic tanks as a result of its use to deodorize drains. One study found that the addition of baking soda improved flocculation of suspended solids. Another study found that adding sodium bicarbonate, sodium chloride, sodium carbonate, sodium hydroxide, potassium bicarbonate, and potassium chloride to septic tank effluents decreased suspended solids and turbidity. DYNAMIC MODELLING AND CONTROL SIMULATION OF A BIOLOGICAL WASTE-WATER TREATMENT PROCESS,
Eidgenossische Technische Hochschule, Zurich (Switzerland). Laboratorium Technisch-Chemisches.
T. von Jeszenszky, and I. J. Dunn.
Water Research, Vol. 10, No. 5, p 461-467, 1976. 11 fig, 2 tab, 9 ref.

Descriptors: *Model studies, *Biological treatment, *Waste water treatment, Control systems, Recycling, Sludge treatment, *Simulation analysis.
Identifiers: Linear models, Monod models.

A dynamic control model of a two-stage reactor for biological treatment of waste water was developed. The rate of sludge recycle was manipulated according to exit substrate concentration deviations or entering substrate flow rate and concentration changes. The influence on process control of a Monod model and a linear model, with and without time delay functions, was investigated. The response of the system to sine variations of inlet concentration and flow was simulated by computer. Sludge recycle control provided substantial improvement for all models. On-off feedback control was best for linear models. Feedforward control was more effective for Monod kinetics. (Snyder-FIRL)

COMPUTER BASED CONTROL FOR WASTE-WATER SYSTEMS,
Greeley and Hansen, Chicago, Ill.
H. D. Gilman, E. F. Ballotti, and C. F. Guarino.
Consulting Engineer, Vol. 46, No. 4, p 46-48, April, 1976.

Descriptors: *Computers, *Waste water treatment, *Control systems, Automatic control, *Model studies, Monitoring.

The computer system is becoming an integral element in control of waste water treatment operations as well as monitoring. This has been noted in the upgrading of the water pollution control facilities in Philadelphia. Guidelines are provided for designing procedural models and documenting studies leading to the preparation of detailed specifications. The specifications should define what the supplier is to provide and delineate the information required by the supplier to form an operational data base. Specific computer performance is harder to specify then hardware, requiring significant written and diagrammed information. The information provided must include the types of information to be stored and displayed and the monitoring and control procedures required by the treatment system. The designs for plant monitoring and control are far more critical than data logging and reports, because integrating the computer into a control strategy is inherently a unique procedure. The computer control specification for a subprocess should include the names of all equipment, monitoring and control signals, descriptions of the monitoring and control requirements, control line diagrams, sample cathode ray tube displays, data and formats for printed logs and reports, alarm and status change log statements, storage of cumulative operation hours, process interface requirements, logic diagrams of the required computer operation procedures, and terminology. SELECTIVE RENOVATION OF EUTROPHIC WASTES PHOSPHATE REMOVAL,
Consiglio Nazionale delle Ricerche, Bari (Italy). Instituto di Ricercha sulle Acque.
G. Boari, L. Liberti, and R. Passino.
Water Research, Vol. 10, No. 5, p 421-428, 1976. 5 fig, 5 tab, 20 ref.

Descriptors: *Sewage effluents, *Eutrophication, *Nutrient removal, *Phosphates, *Waste water treatment, Equilibrium, Chlorides, Recycling.
Identifiers: *Phosphate removal, Chloride/phosphate equilibrium.

As part of the development of a selective process to remove eutrophic species from sewage effluents, the chloride/phosphate equilibrium was studied for various ion resins and the selectivity dependence on several external or internal parameters was evaluated. After being converted into chloride or phosphate form, the resins were tested in columns or by allowing equilibrium to be reached in a flask. Hydrostatic interactions appear to have a great importance in determining resin selectivities in the chloride/phosphate system, but not in the chloride/sulfate equilibrium. The experimental results for the chloride/phosphate equilibrium would lead to selection of a secondary and tertiary amino, porous, 8 to 10% crosslinked, polyacrylic resin having diethylentriamine (DETA) basic groups for selective removal of phosphate from secondary effluents, with .001 to .006 M total concentration, low phosphate concentration, and 6.5 to 7.5 pH. Equilibrium phosphate uptakes were as high as 0.7 kg phosphate/kg dry resin. Resins having more hydrophilic matrices would require adequate physico-chemical stabilization. A possible alternative is once-through utilization of less chemically resistant resins, re-using the resins directly in phosphate form in soil conditioners or fertilizer. (Snyder-FIRL)

COST-EFFECTIVE GOAL,
D. E. Wright.
The Consulting Engineer, Vol. 40, No. 2, p 37, 39, February, 1976.

Descriptors: *Cost analysis, *Model studies, *Computer models, Engineering, *Sewage treatment, Performance, Design criteria, *Waste water treatment, Construction, Treatment facilities.
Identifiers: Cash flow.

An optimization study on sewage treatment carried out by the Construction Industry Research and Information Association (CIRIA) was reported. The process stages are linked by the right kinds of connections and the model responds properly to external stimuli, but assumptions and limitations are inherent in prototype models. Purposes of the study included correcting errors in the computer program and analyzing the sensitivity of the total annual cash flow (TACF) to particular design parameters or cost relationships. The model includes performance relationships, but users must provide cost information. Its results depend totally on the model structure and input data. Influent and effluent quality and various engineering parameters are considered along with TACF. An increase in interest rate or reduction of operating costs shifted the optimal solution away from the use of stages with high capital costs and low operating costs. The lowest number of process units, the maximum volume of individual process units, the cost per unit volume, and the drying-bed area were affected by increasing the model flow incrementally between 0.1 and 0.9 cu m/sec. Several alternative sludge disposal methods, each involving several steps, were compared at various flows. Values considered reasonable for leading design variables were compared with values optimized by the model. It is felt that the model should be developed further, improving performance relationships and economic calculations and adding new processes. (Snyder-FIRL)

DESIGNING MICROSCREENS. HERE'S SOME HELP,
Envirex, Inc., Waukesha, Wis. Water Quality Control Div.
E. P. Saffran, and R. A. Kormanik.
Water and Wastes Engineering, Vol. 13, No. 4, p 41-42, 44-45, April, 1976. 4 fig, 1 tab.

Descriptors: *Hydraulic design, *Mathematical models, Model studies, Equations, *Sewage treatment, *Biochemical oxygen demand, *Suspended solids, *Screens, Turbidity, Filtration, *Waste water treatment.
Identifiers: *Microscreens.

In determining the hydraulic capacity of a microscreen for design purposes, several parameters must be taken into account. These include the rate of clogging of the fabric, the rotational speed of the drum, the area of the submerged screen, the backwash efficiency, and the total head. Mathematical formulae have been derived for calculating filterability, headloss, and the permeability coefficient. Equations and their derivations are presented. Microscreens are used in conventional sewage treatment plants to polish secondary effluent. They have been effective in removing up to 50 to 80% suspended solids, 30 to 50% BOD, and 20 to 50% turbidity. The microscreens are generally sized based on hydraulic loadings in terms of gallons per minute per square foot of submerged area. (Kramer-FIRL)

DESIGN OF A STORMWATER SEWER BY NONLINEAR PROGRAMMING–I,
Sherbrooke Univ. (Quebec). Dept. of Civil Engineering.
P. F. Lemieux, Y. Zech, and R. Delarue.
Canadian Journal of Civil Engineering, Vol. 3, No. 1, p 83-89, March, 1976. 3 fig, 10 ref.

Descriptors: *Mathematical models, *Design criteria, *Sewers, *Pipes, Model studies, Hydrology, Cost analysis, Sewage treatment, Storm water, Drainage, *Waste water treatment.
Identifiers: Nonlinear programming.

Methodology for the design of a stormwater sewer using nonlinear programming has been developed. Pipe flows are calculated at the critical time for the system, using the hydrologic characteristics of the drainage surface. Next, a set of constraints are established for every pipe according to the pipe layout. Thirdly, an optimal solution is found by minimizing the system total cost subject to the constraints defined. A value is then added to the value of every continuous pipe diameter, and the highest standard diameter below or equal to that value is chosen. Finally, a post-optimal analysis is made of the piezometric surface to evaluate the sewer system performance. While the standard diameter solution is not optimal in a mathematical sense, it does lead to efficiency of design. Factors which influence an optimal solution are the inlet time at a node, excavation in soil or rock, ground slope, and Manning's n. (Kramer-FIRL)

MATHEMATICAL MODEL SIMPLIFIES DESIGN OF SLUDGE DRYING BEDS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss.
T. M. Walski.
Water and Sewage Works, Vol. 123, No. 4, p 64-65, April, 1976. 2 fig, 1 tab, 5 ref.

Descriptors: *Mathematical models, *Dewatering, *Sludge treatment, Equations, *Waste water treatment, Treatment facilities, Sludge disposal, Evaporation.
Identifiers: *Sludge drying beds.

Sand drying beds for the dewatering of sludge from small waste water treatment plants have proven economical. A typical sand drying bed is made up of a top layer of sand with an effective grain size of 0.3 to 0.75 mm, underlain by 6 to 12 inches of graded gravel. Wet sludge is placed on the beds, where it drains and dries until it can be lifted and hauled away. Design methods for sizing the beds are detailed, using a rational method to tabulate total bed area required each month. While the rational method is preferred over the empirical formula, it is still awkward to use. A simpler mathematical formula has been derived to account for the major sludge drying mechanism. This model is based on the time for sludge to drain, time for moisture to evaporate from drained sludge, moisture in inches, percent solids, and monthly rainfall. It was demonstrated that the required drying bed area was relatively insensitive to the depth to which the sludge is applied but was quite sensitive to variations in solids concentrations and to the effective evaporation. (Kramer-FIRL)

THE ROLE OF HYDROXYL RADICAL REACTIONS IN OZONATION PROCESSES IN AQUEOUS SOLUTIONS,
Eidgenoessische Technische Hochschule, Zurich (Switzerland).
J. Hoigne, and H. Bader.
Water Research, Vol. 10, No. 5, p 377-386, 1976. 4 fig, 10 tab, 45 ref.

Descriptors: *Ozone, *Waste water treatment, *Kinetics, Biodegradation, Hydrogen ion concentration, Analytical techniques, Equations, Water treatment.
Identifiers: *Hydroxyl radicals.

A reaction scheme involving hydroxyl radical reactions in ozonation processes in water and waste water was investigated. The hypothesis tested was that the ozone may either react directly in substrates or above a critical pH value may decompose prior to reaction with substrates. Beyond the critical pH value, decomposition products of ozone such as hydroxyl radicals (OH) become the important oxidant. The critical pH-value above which the second type of reaction predominates depends upon both the rate which ozone reacts directly with the substrates and on the solutes, including reaction products, that enhance or retard ozone decomposition. Results obtained on aqueous model solution showed that reaction conditions for ozonation can be selected to favor either of the two postulated oxidation mechanisms. While the distinction between the two different mechanisms initiated by ozonation and the use of data available on each will provide a basis for optimizing the ozonation process, the reaction sequences for real waste water systems are more complex and must be analyzed for the individual cases. BIOCHEMICAL AND PHYSICAL PROPERTIES OF AN ACTIVATED SLUDGE ON SETTLING CHARACTERISTICS,
Institute of Public Health, Tokyo (Japan). Dept. of Sanitary Engineering.
Y. Magara, S. Nambu, and K. Utosawa.
Water Research, Vol. 10, No. 1, p 71-77, 1976. 12 fig, 1 tab, 18 ref.

Descriptors: *Activated sludge, *Flocculation, *Settling velocity, *Sewage treatment, *Waste water treatment, Physical properties, Biological treatment, Biological properties, Suspension, Sanitary engineering, Chemical properties, Polymers.
Identifiers: Sludge volume index, Poly-b-hydroxybutyrate.

Relationships between the settling characteristics of activated sludge floc and its biochemical and physical properties were investigated in a laboratory aeration tank. The sludge volume index increased and the settling velocity decreased with an increase in the organic load. Floc density proved to be the most significant physical property affecting floc settling characteristics. Improved floc settling characteristics were associated with increases in floc density and floc strength and with a decrease in floc size. Settling characteristics were also improved by decreasing the electrophoretic mobility due to the disappearance of extracellular polymers and poly-b-hydroxybutyrate during the process of metabolism. The extracellular polymer parameter was the most significant factor affecting activated sludge floc settling characteristics. (Kreager-FIRL).

ASSESSMENT OF THE MAXIMUM CONCENTRATION OF HEAVY METALS IN CRUDE SEWAGE WHICH WILL NOT INHIBIT THE ANAEROBIC DIGESTION OF SLUDGE,
Water Pollution Research Lab., Stevenage (England).
F. E. Mosey.
Water Pollution Control, Vol. 75, No. 1, p 10-20, 1976. 2 fig, 7 tab, 24 ref.

Descriptors: *Heavy metals, *Anaerobic digestion, *Equations, Solids removal, Sludge disposal, *Waste water treatment, Sludge treatment.

A method was developed to predict the effect of mixtures of heavy metals on the anaerobic digestion process. Two equations of similar form were obtained, one indicating conditions under which inhibition is expected, and the other indicating conditions under which the probability that digestion will not be inhibited is at least 90%. Both equations include the content of zinc, nickel, lead, cadmium, copper, and solids arriving or in digesting sludge. Digestion is also safeguarded from heavy metal inhibition when the total weight of these heavy metals in grams arriving daily in the crude sewage does not exceed 4939 times the average daily dry weight in tons of solids fed to the digester. Inhibition of other stages of treatment occurs at heavy metal concentrations similar to those that inhibit anaerobic digestion. The effects on the receiving stream and land on which the sludge is spread must also be considered when formulating suitable conditions. (Snyder-FIRL)

HYDROGEOLOGIC AND OTHER CONSIDERATIONS RELATED TO THE SELECTION OF SANITARY-LANDFILL SITES IN OHIO,
Ohio Dept. of Natural Resources, Columbus. Regional Geology Section.
G. H. Groenewold.
Information Circular Number 41, 1974. 15 p, 6 fig, 2 tab, 18 ref, 1 plate.

Descriptors: *Solid wastes, *Landfills, *Sites, *Leaching, *Leachate, *Water pollution, Groundwater, Water purification, *Ohio, Topography, Hydrogeology, Permeability, Porosity, Surface water, Glacial drift, Glacial soils, Water sources, Clays, Till, Shales, Geologic investigations, On-site investigations, Waste treatment, Waste disposal.
Identifiers: Landfill site selection, Leachate treatment.

Solid waste disposal by landfilling is widely practiced in Ohio. Proper landfill site selection is of major importance so as to prevent escape of toxic leachate and noxious gases from the disposal site. If the site is properly chosen, natural processes of filtration and purification will minimize the threat to ground-water contamination by infiltrating leachate. Major considerations include the topography and hydrogeology of the proposed site as well as the availability of suitable cover materials. Utilization of existing geologic, soil, as well as ground-water and surface-water information in conjunction with on-site investigation is of utmost importance in the proper selection of disposal areas. Sites having natural safeguards and not requiring excessive alteration are abundant in most areas of Ohio. In some localities leachate collection and treatment may be necessary to assure safe disposal. (Heiss-NWWA)

EFFECTS OF TREATED MUNICIPAL WASTEWATER ON OAT FORAGE AND GRAIN,
Arizona Agricultural Experiment Station, Tucson.
A. D. Day, and R. M. Kirkpatrick.
J Environ Qual. 2(2), p 282-284, 1973.

Descriptors: *Oats, *Water reuse, *Crop response, Nutrient requirements, *Recirculated water, *Surface irrigation, Return flow, Waste water(Pollution), Reclaimed water, *Fertilization.

Experiments were conducted at Tucson, Arizona (USA) to study some effects of treated municipal wastewater on growth, yield and quality of oats (Avena sativa L.) grown for pasture forage and grain. No differences were observed in plant height, tillers per plant, green forage yield and total protein between forage grown with well water plus suggested amounts of N, P and K and forage grown with wastewater alone. Oats produced more dry forage when grown with well

water plus suggested N, P and K than when irrigated with wastewater. Wastewater produced forage with higher moisture content than well water plus N, P and K. When grown for forage, cultivars differed in plant height, dry forage yield and total protein content. Oat grain data showed no differences between irrigation and fertilizer treatments for maturity, plant height, panicles per unit area, grain yield and total protein. Well water plus suggested N, P and K resulted in fewer seeds per panicle and heavier seeds than wastewater. Cultivars differed in maturity, plant height, panicles per unit area, seeds per panicle, seed weight, grain yield and total protein. Treated municipal wastewater can be utilized to produce oats with grain yields and forage and grain protein contents approximately equal to those obtained when oats are grown with well water and suggested levels of N, P and K.--Copyright 1973, Biological Abstracts, Inc.

SWINE WASTE DIGESTION ENHANCEMENT WITH NUTRIENT SEPARATION,
Kansas Water Resources Research Inst., Manhattan.
L. A. Schmid, and R. I. Lipper.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-255 021, $4.00 in paper copy, $2.25 in microfiche. Completion Report, KWRRI Contribution No. 173, June 1976. 29 p, 3 fig, 6 tab, 31 ref, append. OWRT A-063-KAN(1), 14-31-0001-5016.

Descriptors: *Anaerobic digestion, *Farm wastes, Hogs, *Waste water treatment, Nutrients, Separation techniques, Carbon dioxide, Ammonia, Methane, Nutrient removal, Anaerobic bacteria, Gases.
Identifiers: *Swine wastes, Methane production, Ammonia removal, Carbon dioxide removal.

A swine waste anaerobic digester receiving the waste from 80 boars was operated for a period of ten months. Digester mixing and nutrient removal were accomplished by the recirculation of digester gases through two stripping units. Phosphoric acid was used to strip ammonia from the recirculated gas stream. Caustic solutions, primarily lime, were used to strip carbon dioxide. The removal of carbon dioxide resulted in an elevation of digester pH to 8.0. At the elevated pH ammonia was more readily stripped. A system specific ammonia desorption coefficient was determined which may be used for selecting gas flow rates. The selection of the proper gas flow rate can provide the required degree of ammonia removal to reduce ammonia concentrations to levels non-toxic to anaerobic bacteria. (Powers-Kansas State)

NITROGEN REMOVAL DEPENDS ON FORM NUTRIENT TAKES,
Metcalf and Eddy, Inc., Boston, Mass.
B. W. Behrman.
Water and Wastes Engineering, p 27-29, 46, February, 1976. 1 fig.

Descriptors: *Nitrogen, *Nitrites, *Ammonia, *Waste water treatment, *Biocontrol, Nitrogen fixing bacteria, Land use, Algae, Chlorination, Ion exchange, Economic feasibility, Bacteria, Water quality control.
Identifiers: Ammonia stripping, Breakpoint chlorination.

Most nitrogen in raw municipal wastewaters is in ammonia form, but 30-50% is usually associated with organic matter which may be biologically broken down to ammonia if the waste receives secondary treatment. Nitrifying bacteria may be used under certain conditions to convert some ammonia to nitrites and nitrates, which rarely occur in raw wastewater. Biological control technology involves specialized microorganisms to oxidize and/or remove wastewater N. Such methods are described and their benefits analyzed. Biological control can be accomplished by land application of wastewaters, although removal rates are highly variable and depend on application rates as well as the soil's pH, temperature, dissolved oxygen and organic carbon content. Another method involving harvesting algae has economic disadvantages. Three physical-chemical removal processes are ammonia stripping, breakpoint chlorination and selective ammonium ion exchange, none of which can remove N in the organic, nitrite or nitrate forms. Advantages and disadvantages of these techniques are described. Economic factors in various types of N control are also analyzed. (Jahns-Arizona)

THE INFLUENCE OF THE SURFACE RUNOFF OF HEAVY RAINS ON THE CALCULATION OF SEWERS (UBER DEN EINFLUSS DES FLACHENABFLUSSES DER STARKREGEN AUF DIE BERECHUNG VON KANALISATIONEN),
H. Schulz.
Wasserwirtschaft-Wassertechnik, Vol. 26, No. 3, p 99-101, 1976. 5 fig, 2 ref.

Descriptors: *Sewers, *Storm runoff, Analytical techniques, *Combined sewers, *Drainage systems, Dimensioning, Retention, Flood frequency, Mathematical studies.
Identifiers: Space-time coefficient method.

A space-time coefficient method is described for the calculation of the influence of heavy rains on sewer dimensions. According to this method, the sewer system is dimensioned as a function of a retention coefficient, which is dependent of the sewer length per unit area and ultimately of the sewer length to flow rate ratio, and of a dynamic storage capacity, which is dependent of the orographic conditions. The usual reserves and safety margins are eliminated, which implies that the envisaged frequency of flood may actually occur. This frequency should be reduced accordingly for certain overflow in mixed sewer systems, retention basins or drainage canals in important urban and industrial agglomerations. (Takacs-FIRL)
W76-10197

THE EFFECT OF VARIOUS DESIGNS OF RAIN CATCHING BASINS ON THE POLLUTION OF THE RECEIVING WATER AND THE ECONOMY OF THE SEWER SYSTEM (DIE AUSWIRKUNG DER VERSCHIEDENEN BAUARTEN VON REGENUBERLAUFBECKEN AUF DIE SCHMUTZBELASTUNG DES VORFLUTERS UND DIE WIRTSCHAFTLICHKEIT DES KANALNETZES),
Stuttgart Univ. (West Germany). Institut fuer Siedlungswasserbau und Wasserguetewirtschaft.
K. Krauth.
Berichte der Abwassertechnischen Vereinigung e.V., No. 28, p 583-591, 1976. 6 fig, 1 tab, 4 ref.

Descriptors: *Basins, *Rain water, *Combined sewers, *Runoff, Bypasses, Watersheds(Basins), Rainfall, Design, Retention.

General considerations on the influence of rain catching basins on the pollution of recipients and on the economy of the mixed sewer system are presented. The efficiency of rainwater retention basins is apparent from the fact that the pollutant loads occurring during the initial phase of the rainwater runoff are multiples of the average load. Several basins should be linked in a by-pass system to prevent the discharge of runoff once retained in one basin into the recipient from the next one. Catchment basins are unable to retain the runoff during the later phase of many prolonged rain events. Basins of up to 500 cu m should be self-scavenging, and scavengers are necessary for larger units. For economic reasons, large areas should be subdivided into homogeneous zones of 20-40 ha each, with separate runoff retention basins in by-pass. (Takacs-FIRL)

APPARATUS AND METHOD FOR REMOVING POLLUTANTS FROM WASTEWATER,
Swift and Co., Chicago, Ill. (Assignee).
E. R. Ramirez, and D. L. Johnson.
United States Patent 3,959,131. Issued May 25, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 4, p 1738, May, 1976. 1 fig.

Descriptors: *Patents, *Waste water treatment, Treatment facilities, *Flotation, *Aggregates, Treatment, Equipment, Wastes, Separation techniques, Bubbles.

A patent for a raw waste water treatment system is described. The system includes a tank into which the waste water is introduced and a bubble introduction means located below and in communication with the tank for supplying a dense zone of fine bubbles to the tank. The pollutants in the waste water combine with the bubbles to form aggregates which remain unseparated from the waste water flow. The aggregates and treated waste water flow are removed through a transfer conduit to a flotation basin for separation of the pollutants and bubbles from the clarified waste water. (Kreager-FIRL)

WASTE WATER TREATMENT.
Westinghouse Electric Corp., Melbourne (Australia).
Australian Patent 470,038. Issued March 4, 1976. Official Journal of Patents, Trade Marks and Designs, Vol. 46, No. 7, p 663, March, 1976.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Treatment facilities, *Patents, Separation techniques, Incineration, Disposal, Solid wastes, Liquid wastes, Filtration, Absorption, Colloids, Granules.

A waste water treatment system was patented. It includes an enclosure with an inlet adapted for receiving sewage influent for conditioning, separate liquid and solids outlets, and a liquid-solids separator in the enclosure receiving the influent to separate the solid and the liquid and to deliver the solids to the solids outlet. An incinerator which is associated with the outlet burns the solids delivered to it. A surge conditioning tank associated with the liquid outlet receives the liquid that has been separated. Chemical feed means connect with the tank to introduce chemical substances to condition the liquid. Filtration-absorption means connect with a tank outlet to remove colloidal material not removed by the separator. The filtration-absorption means include at least a stripper column with a mixture of various kinds of granules. One kind is chosen from materials having positive electrode potentials compared to hydrogen and another from materials having negative electrode potentials compared to hydrogen. (Snyder-FIRL)

PROCESS FOR DECONTAMINATING SEWAGE CONTAINING CYANIDE,
Heinrich Koppers Gesellschaft mit Beschrankter Haftung, Essen (West Germany) (Assignee).
H. Kloster, G. Preusser, and P. Radusch.
United States Patent 3,959,130. Issued May 25, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 4, p 1738, May, 1976.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, Chemical wastes, *Fly ash, *Patents, Hydrogen ion concentration, Separation techniques, Particle size.
Identifiers: *Cyanide.

A process for decontaminating sewage containing cyanide was patented. The cyanide is removed from sewage by maintaining the sewage in contact with a fly ash product produced during the gasification or combustion of coal dust, lignite, or coal at pH 7 or greater for 10 minutes or more. The fly ash product particles are smaller than approximately 25 microns. The sewage and the fly ash product are then separated. (Snyder-FIRL)

TREATMENT AND DISPOSAL OF SEWAGE SLUDGE,
Sterling Drug Inc., New York. (Assignee).
G. H. Teletzke.
United States Patent 3,959,125. Issued May 25, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 4, p 1737, May, 1976.

Descriptors: *Biological treatment, *Heat treatment, *Sludge treatment, *Patents, *Landfills, *Sewage sludge, Sludge disposal, Microorganisms, Seeds.

A process was patented to condition sewage sludge for land disposal. The sludge is rendered free of viable plant seeds and disease-producing microorganisms by heating it to between approximately 65 C and 150 C for between about 30 seconds and 60 minutes. The time and the temperature vary inversely. Without separating liquid and solid phases, the resulting fluid sterilized sewage sludge is biologically digested at a temperature between about 32 C and 60 C. (Snyder-FIRL)
W76-10204

SEWAGE HANDLING AND DISPOSAL PROCESS FOR CHLORIDE (NACL) CONTAMINATED SLUDGES,
Dorr-Oliver Inc., Stamford, Conn. (Assignee).
R. S. Millward.
United States Patent 3,959,126. Issued May 25, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 4, p 1737, May, 1976.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Sewerage, *Treatment facilities, *Sewage sludge, Biological treatment, *Sodium chloride, Centrifugation, Chlorides, Saline water, Desalination.

A method was patented to treat sewage that contains sodium chloride from infiltration by salt water. It is suitable for sodium chloride concentrations that become corrosive at temperatures used to sterilize sludge. The sewage is treated to produce biologically treated sludge. This biologically treated sludge is centrifugally separated and concentrated in a nozzle type centrifuge. An underflow fraction with a controllable concentration and a overflow separated liquid fraction are delivered through the machine's nozzles. Wash water is fed into the separating chamber at a rate effectively blocking sodium chloride from discharging with the underflow fraction by displacing the sodium chloride by the wash water toward overflow, delivering underflow sludge substantially free of sodium chloride and an overflow that contains the displaced sodium chloride. This underflow sludge is heated by passing through heating apparatus which could otherwise be corroded by the sodium chloride at sterilizing temperatures. (Snyder-FIRL)
W76-10205

TRACTION-DRIVEN COMPOSITE SLUDGE RAKING MECHANISM FOR SEDIMENTATION TANKS,
Dorr-Oliver, Inc., Stamford, Conn. (Assignee).
J. A. Seifert, D. R. Hill, and M. Smith.
United States Patent 3,959,152. Issued May 25, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 4, p 1746, May, 1976. 1 fig.

Descriptors: *Patents, *Sludge treatment, *Sediment discharge, *Settling basins, *Sediment control, *Waste water treatment, Treatment facilities, Sedimentation, Treatment, Equipment, Sediments, Wastes.

A patent for a sludge raking mechanism for sedimentation tanks is described. A bladed rake arm extends from the lower end of a vertical cage structure surrounding a center pier near the discharge means of a settling tank and swings from a predetermined lowermost normal raking position to move the sludge toward the discharge means. The rake arm yields upwardly along the predetermined path when excessive sediment accumulation in the inner zone of the settling tank occurs. An outer complementary raking means functions to move light sedimentation sludge loads from an outer annular zone to the inner zone of sedimentation sludge accumulation. (Kreager-FIRL)
W76-10206

WASTE TREATMENT PROCESS,
Alar Engineering Corp., Chicago, Ill. (Assignee).
H. R. White, and A. J. Doncer.
United States Patent 3,959,129. Issued May 25, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 4, p 1737-1738, May, 1976. 1 fig, 1 tab.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Chemical reactions, *Solubility, *Filtration, Treatment, Wastes, Adhesives.
Identifiers: Printing wastes, Paper board wastes.

A patent involving a process for treating waste waters derived from the clean-up of at least one water-based flexographic printing ink and from the clean-up of at least one starch based adhesive used in corrugated paper board manufacturing is described. The process involves the addition to the waste water of 500-5000 ppm of dissolved, water-soluble iron salt (selected from ferrous sulfate, ferric sulfate, or ferric chloride); agitation of the resulting mixture for a period of 20 min to 4 hr; mixing the agitated mixture with 500-5000 ppm of calcium hydroxide (composed of particles less than 250 micron); agitation of the resulting mixture for a period of 20 min to 4 hr; and the continuous passage of the resulting mixture over the surface of a rotating drum vacuum filter assembly which is coated with a layer of water-insoluble, inert particulate material having a particle size less than about 250 microns. The aqueous portion of the mixture is simultaneously withdrawn through the surface portion of the rotating drum, while the filter cake deposited on the outer surface portion of the drum is moved along a longitudinal path of the drum. The waste water treated should contain a 4000-60,000 ppm of suspended solids with an average diameter below about 200 milli-micron and 1-6 weight % non-aqueous matter. (Kreager-FIRL)
W76-10207

METHOD AND APPARATUS FOR THE ACTIVATED SLUDGE TREATMENT OF WASTEWATER,
Sweco, Inc., Los Angeles, Calif. (Assignee).
G. Tchobanoglous.
United States Patent 3,959,124. Issued May 25, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 4, p 1736-1737, May, 1976. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Activated sludge, *Aeration, *Screens, Treatment facilities, Equipment, Wastes, Treatment, *Sludge treatment.

A patent for an activated sludge waste water treatment method and apparatus is described. The apparatus includes an aeration basin and a secondary clarifier along with a screening means arranged for receiving at least a portion of the flow from the aeration basin for solids removal. The screening means includes at least one screen and a distribution means for directing the flow with a substantial relative movement itself and the screen so that the screen is maintained unclogged. The screening means divides the flow into a screened effluent and a concentrate. The former is directed to the secondary clarifier and the latter to the aeration basin for control of the mean cell residence time in the aeration basin. (Kreager-FIRL)
W76-10208

RECIRCULATING SEWERAGE SYSTEM,
Koehler-Dayton, Inc., New Britain, Conn. (Assignee).
F. J. Bogusz.
United States Patent 3,958,279. Issued May 25, 1976. Official Gazette of the United States Patent Office, Vol. 946, No. 4, p 1460, May, 1976. 1 fig.

Descriptors: *Sewage treatment, *Waste water treatment, *Sewerage, *Recycling, *Patents, *Treatment facilities, Equipment, Treatment, Sewage disposal, Waste disposal, Wastes, Sewage effluents.

A patent for a recirculating sewerage system is described. The sewage system consists of a toilet, a recirculating tank, a drain conduit which communicates with the bottom of the recirculating tank, a valve for controlling the gravitational flow of sewage from the recirculating tank through the drain conduit, and a means for directing the effluent from the toilet into the recirculating tank. When the system is operated in the flushing mode, a means for energizing a pump communicating with the recirculating tank is provided along with a means for recirculating the effluent discharged by the pump to the toilet for flushing purposes. Means are also provided for operating the system in a drain mode whenever the recirculating tank is to be drained. (Kreager-FIRL)
W76-10209

WHAT TO DO WITH SEWAGE SLUDGE.
Mosaic, Vol. 7, No. 3, p 20-28, May-June, 1976. 1 fig.

Descriptors: *Sewage sludge, *Sewage disposal, *Waste water treatment, *Land use, Odor, Heavy metals, Groundwater, Water pollution sources, Microorganisms, Irradiation.
Identifiers: Land application.

Higher degrees of purification of waste water are producing larger amounts of sludge, at the same time that it is becoming more difficult to dispose of. Application to land is considered more practical than burning or disposal at sea. Problems with application to land include the heavy metal content of the sludge, odor, and objections from local residents. Most existing sludge disposal options seem to have serious drawbacks. Research is underway on the economic and health problems of land disposal. One system being studied involves injection of sludge under the soil surface. Potential

problems with the method include nitrate pollution of groundwater, contamination of crops with heavy metals, and infection of soil and groundwater with microorganisms. The extent of these problems varies with sludge, soil, and moisture conditions. Microorganisms pose the most serious problem. Irradiation of sludge is being studied as a means of inactivating pathogenic agents. (Snyder-FIRL)
W76-10210

HYDROGEN PEROXIDE SOLVES SLUDGE ODOR PROBLEM,
Appleton Public Works, Wis.
R. G. Miller.
Water and Sewage Works, Vol. 123, No. 5, p 74-76, May, 1976. 1 fig.

Descriptors: *Waste water treatment, *Activated sludge, *Treatment facilities, *Sludge treatment, *Dewatering, Odor, Hydrogen sulfide, Industrial wastes, Domestic wastes.
Identifiers: Hydrogen peroxide, *Odor control.

An extreme problem with hydrogen sulfide odor from sludge dewatering at a waste treatment plant was solved using hydrogen peroxide treatment. The activated sludge plant serves Appleton, Wisconsin, treating both residential and industrial waste. A classical pattern of primary and secondary treatment is used. The filter room odor problem had existed ever since the secondary treatment facility began operation. The dewatered sludge disposed of on land also emitted a sulfide odor. Hydrogen peroxide, which controls hydrogen sulfide odors by breaking down hydrogen sulfide into elemental sulfur and water, was tested for effectiveness. The hydrogen peroxide was injected into a main between the storage tanks and the vacuum filters, to remove the sulfide producing slimes that populated the mains. Injection at 50 ppm resulted in no sulfides or odor in the sludge and no hydrogen sulfide in the atmosphere. The sulfide odor in the filter room also disappeared, and the hydrogen peroxide was easy to store and inject. This method of odor control was instituted immediately after it was proved effective. (Snyder-FIRL)
W76-10211

TREATMENT OF WASTE WITH OXYGEN OR OZONE.
Commonwealth Industrial Gases, Ltd., Sydney (Australia).
Australian Patent 470,115. Issued March 4, 1976. Official Journal of Patents, Trade Marks and Designs, Vol. 46, No. 7, p 683, March, 1976.

Descriptors: *Liquid wastes, Waste treatment, *Patents, *Ozone, *Oxygen, *Waste water treatment, Recycling, Chemical oxygen demand.

A process for treating liquid wastes with oxygen or ozone has been patented. Such wastes have an oxygen demand sufficient that when the liquor is contacted with a treatment gas having an oxygen content in the range 70 to 95% by volume, at least a part of the effluent gas produced is subjected to an enrichment step. This will restore its oxygen content to the treatment level. The oxygen is then recycled. (Kramer-FIRL)
W76-10212

FOUR-MODE TREATMENT PLANT WILL GENERATE SODIUM HYPOCHLORITE ONSITE.
The American City and County, Vol. 91, No. 5, p 22, May, 1976.

Descriptors: *Waste water treatment, *Activated sludge, *Biochemical oxygen demand, *Treatment facilities, *Sodium compounds, Sea water, Disinfection, Aeration, Suspended solids, Sludge disposal, Dewatering, Incineration, Connecticut.
Identifiers: *Sodium hypochlorite.

Seawater will be used for generating sodium hypochlorite for use as a disinfectant in a waste water treatment plant being constructed in New Haven, Connecticut. Volume and strength of the waste water and Connecticut State requirements dictated design of a flexible aeration system. The aeration process includes four modes: conventional activated sludge to treat low-strength domestic wastes, a complete-mix process to protect against shock loads, step aeration for better oxygen utilization which periodically may be required, and contact stabilization because land for later staged expansion is unavailable. Adjustable outlet weirs, either automatically or manually operated, will control the water levels of the aeration basins to provide the required extent of oxygen transfer. Warm, screened seawater, previously used for condenser cooling, will be obtained from an electric generating station outfall near the treatment plant. After degritting, gravity thickeners and centrifuges will thicken the primary sludge, and primary and thickened waste activated sludge will be mixed. A reactor will oxidize volatile sludge solids; insoluble volatile matter in the sludge is reduced by 30%, and the oxidized sludge is then thickened. The dewatered sludge will be disposed of in a multiple hearth incinerator. The facility, which is scheduled for completion in 1979, will be able to handle 100 mgd peak flow and will reduce biochemical oxygen demand (BOD) and suspended solids by 90%. (Snyder-FIRL)
W76-10213

WHAT'S NEW IN OZONATION, OXYGENATION, REVERSE OSMOSIS AND ULTRAFILTRATION.
Modern Power and Engineering, Vol. 70, No. 4, p 44, April, 1976.

Descriptors: *Ozone, *Reverse osmosis, *Waste water treatment, *Sewage treatment, *Recycling, Sewage treatment, Effluents, Industrial wastes, *Oxygenation, Filtration.
Identifiers: *Ultrafiltration, Ozonation.

Ozonation techniques for both industrial and municipal waste treatment have increased in recent years and wider applications of ozone to sewage treatment plant effluents have been developed. Since ozone treatment removes contaminants without producing known toxic materials and simultaneously increases the dissolved oxygen levels of the treated waters, emphasis on recycling and reuse of process waters has encouraged renewed interest in the study of ozonation processes. The performance of ozone equipment has improved significantly and costs of producing ozone have been greatly reduced. One United States ozone manufacturer even promises ozone disinfection of water at the same prices as chlorination. Other growing technologies for treating municipal and combined municipal-industrial waste waters are detailed. These include oxygenation, reverse osmosis, and ultrafiltration. (Kramer-FIRL)
W76-10214

EXPERIMENTS ON RAPID SAND FILTRATION OF BIOLOGICAL SEWAGE TREATMENT-PLANT EFFLUENTS (UNTERSUCHUNGEN UEBER DAS VERHALTEN VON SCHNELL-SANDFILTERN BEI DER FILTRATION EINES BIOLOGISCH GEREINIGTEN KLAERANLAGENABLAUFS),
B. Hanisch, V. Mayer, and B. Zacher.
Wasserwirtschaft, Vol. 66, No. 5, p 144-147, 1976. 5 fig, 4 tab, 3 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, *Filtration, Sands, *Biological treatment, Filters, Biochemical oxygen demand, Pilot plants, Activated sludge.
Identifiers: Upflow filters, *Sand filtration.

Part of the residual biochemical oxygen demand (BOD) in the effluent of biological sewage treatment plants is produced by small floc particles, which are not retained in the final sedimentation tanks. According to experiences in Great Britain, rapid filtration in sand filters can effectively remove these suspended solids. Downflow filters of the kind used for water treatment were used earlier; more recently, upflow filters have also been used. Some results of experiments with filters at The Institut fuer Siedlungwasserbau und Wassergutewirtschaft in Stuttgart-Busnau are reported. These experiments are directed toward correlating the most important parameters of the process. Activated sludge plant effluent, treated in pilot rapid sand filters of both types, is less highly nitrified than was reported for the plants in Britain. (Snyder-FIRL)
W76-10215

USE OF THE EARTH'S CRUST FOR TREATMENT OR STORAGE OF SEWAGE EFFLUENT AND OTHER WASTE FLUIDS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
H. Bouwer.
CRC Critical Reviews in Environmental Control, Vol. 6, No. 2, p 111-130, March, 1976. 1 fig, 2 tab, 97 ref.

Descriptors: *Waste water treatment, *Underground storage, *Waste storage, *Sewage effluents, *Liquid wastes, Land use, Irrigation, Organic wastes, Nitrogen.
Identifiers: Land application.

Land application or underground storage of liquid wastes may be most feasible in a number of situations. Surface application usually is restricted to wastes with mostly organic pollutants. Low-rate systems involve using secondary or equivalent treated effluent to irrigate crops. The amount of nitrogen applied to the soil by sewage sludge is not much more than the crop can remove, but the system must stimulate denitrification for animal waste slurries. Damaging effects of metals can be minimized by lime addition and by growing relatively insensitive crops. Boron is adsorbed by components in some soils. Due to the amount of land needed, low-rate systems are generally used only for small capacity. Overland flow systems, in which waste water flows over sloping fields, can significantly improve quality if the loading rates are relatively low. High rate systems require less land, but the renovated water is usually intercepted to prevent spreading into the aquifer. It can be intercepted by choosing a location where it drains naturally into surface water, or by drains or wells. The water table should not rise high enough below the infiltration area to restrict infiltration. Infiltration and drying periods are generally alternated. Because land treatment is so dependent on local conditions, use of a pilot system for at least one year is desirable. Land treatment costs depend on the cost of the land needed, its distance from the treatment plant, and the cost of wells or drains to collect the renovated water. (Snyder-FIRL)
W76-10216

OPTIMIZING CENTRIFUGE DECANTATION FOR SLUDGE THICKENING (OPTIMISATION DES DECANTEUSES CENTRIFUGES POUR LA CONCENTRATION DES BOUS),
Alfa-Laval A. B., Tumba (Sweden).
L. Kallstrom.
Techniques et Sciences Municipales – L'Eau, No. 3, p 141-143, March, 1976. 4 fig.

Descriptors: *Treatment facilities, *Centrifugation, *Sludge treatment, *Industrial wastes, Sludge, Flocculation, Effluents, Optimization, On-site tests, *Waste water treatment.
Identifiers: *Centrifuge decantation.

Optimizing a decantation centrifugation installation consists in establishing an equilibrium between yield and economy, and achieving max-

imum capacity, sludge dryness, and clarity of effluent with minimum energy and chemical expenditure. Adjustment of the installation involves a number of parameters such as rotor and conveyer speeds, and volume of liquid in the rotor. Rate and dosage of the flocculant are then adjusted together by one of two methods or a combination of both; with the first, a feeding rate is chosen significantly lower than the theoretical maximum, thereby increasing transit time and the quantity of fine particles on the rotor. With the second method, more flocculant is used to gather the fine particles into larger flocs which will be deposited more quickly in the force field of the centrifuge. A combination of both is frequently chosen in view of economic considerations. (Waltner-FIRL)
W76-10217

BUFFERING AIDS DIGESTION OF WASTE.
Chemical Week, Vol. 118, No. 23, p 51, June 9, 1976. 1 fig.

Descriptors: *Waste water treatment, *Biological treatment, *Biochemical oxygen demand, Treatment facilities, *Sodium compounds, Bicarbonates, Digestion, Hydrogen ion concentration, Trickling filters.
Identifiers: *Sodium bicarbonate, Buffering, Waste digestion.

Municipal waste treatment plants work better when buffered with sodium bicarbonate. Sodium bicarbonate use enabled the 37-yr old Hightstown plant, which was once slated for replacement because it could not meet Environmental Protection Agency standards, to operate well within EPA limits. Septic tank users have also reported that sodium bicarbonate additions increased tank life. Some municipal waste treatment plants use sodium bicarbonate on a spot basis to improve alkalinity. It was considered the 'best alkaline chemical' to adjust pH without danger of overdosage. Sodium bicarbonate also reduces biochemical oxygen demand (BOD), sulfide odors, corrosion, and sludge-handling costs; increases solids settling, toxic-pollutant removal, and methane production; and controls nitrification. Rejuvenating the one million-gal/day trickling-filter, biological waste treatment plant in Highstown was the first major project using sodium bicarbonate. Adding sodium bicarbonate to the waste influent and digester produced a return of bacterial activity to the trickling filter and reduced BOD from 36 to 7. Sodium bicarbonate can also significantly reduce sludge volume. Sodium bicarbonate costs more per ton than other waste treatment chemicals, but usually only half the volume of sodium bicarbonate is needed. Sodium bicarbonate is also easier and less hazardous to handle than many chemicals. Although some large plants use sodium bicarbonate for functions such as neutralization and methane production, most users are expected to be small plants where sophisticated equipment is unaffordable. (Snyder-FIRL)
W76-10218

WASTEWATER RENOVATION AND REUSE: VIRUS REMOVAL BY SOIL FILTRATION,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
R. G. Gilbert, R. C. Rice, H. Bouwer, C. P. Gerba, and C. Wallis.
Science, Vol. 192, No. 4243, p 1004-1005, June 4, 1976. 1 tab, 10 ref.

Descriptors: *Waste water treatment, *Sewage treatment, Treatment facilities, *Filtration, Sewage effluents, *Reclaimed water, Groundwater, Viruses, *Water reuse, Soils.
Identifiers: *Soil filtration, *Virus removal.

Renovated water and secondary sewage effluent from four wells at the Flushing Meadows Wastewater Renovation Project, a land disposal project near Phoenix, Arizona, operating since 1967, were sampled about every 2 months in 1974 during flooding periods. The samples were assayed for viruses by bottle culture and the overlay method, using primary kidney cells from immature baboons. The number of viruses detected in the sewage effluents averaged 2118 per 100 liters with a minimum of 158 per 100 liters and a maximum of 7475 per 100 liters. Seven types of viruses were identified, whose occurrence varied seasonally. No viruses were detected in renovated water samples. Apparently human viral pathogens do not move through soil into groundwater, but are absorbed and degraded by the soil, their numbers being reduced by a factor of at least 10,000. (Snyder-FIRL)
W76-10219

GENERAL CONSIDERATIONS IN WASTEWATER DISINFECTION,
Ontario Ministry of the Environment, Toronto. Wastewater Treatment Section.
F. A. Tonelli.
Water and Pollution Control, Vol. 114, No. 5, p 23-24, 28, 30, 46-47, May, 1976. 1 fig, 9 tab.

Descriptors: *Waste water treatment, *Disinfection, *Chlorination, *Gamma rays, *Pathogenic bacteria, Coliforms, Aquatic microorganisms, Resistance.
Identifiers: *Gamma irradiation.

The objective of waste water disinfection is to destroy pathogens before discharging the waste water. Because of the varied resistance of microorganisms to any disinfectant, more than one organism should be used to assess efficiency. Total coliforms or fecal coliforms are usually used. Chemical conditions in the waste water determine the chemical reactions undergone by added chlorine; the effectiveness as a disinfectant varies for different chlorine compounds. Efficiency of disinfection can be seriously impaired at lowered temperatures. Contact time and residual are equally important in determining coliform kill. Thorough initial mixing of concentrated chlorine solution and bulk waste water is necessary for optimum disinfection. A contact chamber with highly developed plug flow characteristics is desirable, so that detention time can be known with some certainty and back mixing can be avoided as much as possible. Process control for chlorination involves maintaining a specified residual at the end of the chlorine contact chamber detention period; methods include manually setting the chlorine addition rate, flow-paced chlorine application, and compound loop control, in order of increasing complexity. Reaction with sulfur dioxide is currently the best developed dechlorination process, but excess sulfur dioxide can increase the oxygen demand of the effluent and depress the pH of the waste water. (Snyder-FIRL)

APPLICATION OF ACTIVATED SLUDGE DESIGN AND OPERATION,
Oklahoma State Univ., Stillwater.
T. L. Bentley, and D. F. Kincannon.
Water and Sewage Works, Reference number, p R10-R-13, April 30, 1976. 9 fig, 1 tab, 14 ref.

Descriptors: *Trickling filters, *Biological treatment, *Aerobic treatment, *Activated sludge, *Biodegradation, Treatment, Equipment, Chemical oxygen demand, Microorganisms, Evaluation, Performance, *Waste water treatment.

Parameters affecting the operation and performance of laboratory-scale biological towers (trickling filters) were investigated and compared with those commonly used to describe activated sludge processes. Sucrose was used as the carbon source and growth-limiting nutrient for a prepared synthetic waste used in the investigation. The parameter food to microorganism ratio and mean cell residence time which are used for designing activated sludge systems were also found suitable for describing the operation of trickling filters. A comparison of both treatment processes with the same loading parameters resulted in similar treatment efficiencies being obtained. Treatment efficiencies of 95% were obtained in each case for food to microorganism ratios of 0.5. Variation in the percent of chemical oxygen demand removal as a function of mean cell residence time for the experimental trickling towers was also similar to curves obtained for activated sludge systems. BIOLOGICAL TREATMENT PROCESS IN COLD CLIMATES,
CH2M/Hill, Corvallis, Oreg. Wastewater Reclamation.
J. D. Boyle.
Water and Sewage Works, Reference number, p R-28, R-30, R-32-R-34, R-37-R-38, R-43-R-44, R-46, R-48, R-50, April 30, 1976. 16 fig, 2 tab, 9 ref.

Descriptors: *Biological treatment, *Aeration, *Activated sludge, *Trickling filters, *Temperature, *Kinetics, *Waste water treatment, Equipment, Treatment facilities, Performance, Biochemical oxygen demand, Heat transfer, Cold regions, Climates.

The effects of cold climates on three aerobic biological treatment processes are examined. The treatment processes considered are: extended aeration and conventional activated sludge systems utilizing air as an oxygen source, oxygen-activated sludge systems (covered and uncovered), and activated biological filtration systems (activated sludge and trickling filter combination). Temperature-sensitive parameters discussed include: effluent biochemical oxygen demand, solids production, aeration requirements, horsepower requirements, and heat loss. Housing the biota within a process that is able to resist the adverse effects of low temperature on the processes' kinetics can significantly improve the cold weather performance of biological treatment systems. W76-10222

VERTICAL STATIC TUBE AERATORS: EVALUATING THEIR PERFORMANCE,
Associated Engineering Services, Ltd., Vancouver (British Columbia).
M. J. Stewart, and T. R. Lidkea.
Water and Sewage Works, Reference number, p R80-R84, April 30, 1976. 5 fig, 2 tab, 10 ref.

Descriptors: *Aeration, *Oxygen, *Transfer, *Rates, *Waste water treatment, Equipment, Evaluation, Performance, Testing procedures.
Identifiers: *Aeration, Vertical static tube.

A procedure for finding the oxygen transfer rate of vertical static tube aerators based on the oxygen concentration versus lapsed time of aeration values obtained during a given test run is described. The procedure consists of the following steps: an evaluation of the oxygen saturation concentration which has been corrected for site barometric pressure, mid-depth, water pressure, and water vapor pressure; calculation of the oxygen transfer coefficient by plotting the difference between the oxygen saturation concentration and the oxygen concentration in a water sample collected at a given time versus the time on semilog paper; correction of the oxygen transfer coefficient to 20 C; calculation of the true (mid-depth) oxygen transfer rate under standard conditions using the oxygen transfer coefficient at 20C; and calculation of the transfer rate at the waste water treatment plant site under operating conditions. (Kreager-FIRL)
W76-10223

THE DISPOSAL OF SEWAGE FROM COASTAL TOWNS: THE CASE FOR TREATMENT,
E. C. Whitaker.

Water Pollution Control, Vol. 75, No. 2, p 146-152, 1976. 3 fig.

Descriptors: *Oceans, *Sewage treatment, *Sewage effluents, *Sewage disposal, *Sewage, Beaches, Decision making, Treatment facilities, Public health, *Outfall sewers, *Waste water treatment.

Factors leading to the decision to install an inland sewage treatment plant at a British coastal town are reviewed. Prior to the treatment plant installation, direct outfall discharge to the sea was observed up to 600 m offshore, and sewage was often observed on high water marks. More than 10,000 kg of litter was removed daily over a 3-kilometer stretch of the coastal beach area. Factors other than pollution of the beaches which contributed to a decision to install an inland treatment plant included: the potential health hazard associated with direct sewage discharge, a rapid increase in housing development with no drainage except cesspools, and flooding as a result of overloaded sewers. (Kreager-FIRL)
W76-10225

DIFFUSED AIR IN DEEP TANK AERATION,
Water Pollution Control Corp., Milwaukee, Wis.
F. L. Schmit, P. M. Thayer, and D. T. Redmon.
Water and Sewage Works, Reference number, p R-86-88, R-90, R-92-R-93, April 30, 1976. 9 fig, 3 tab, 16 ref.

Descriptors: *Aeration, *Efficiencies, Oxygen, *Oxygenation, Waste treatment, Equipment, Evaluation, Performance, *Waste water treatment, Tanks.
Identifiers: *Oxygen transfer, Tank geometry, *Aeration tanks.

Factors affecting oxygen transfer efficiencies and power requirements of deep tank aeration systems were investigated using a steel tank 34 ft in. wide by 6 ft long by 24 ft deep. Temporary baffles were used to permit the evaluation of two tank widths. For a given oxygen transfer capability, a tank width of 34 ft 4 in was more efficient than a tank width of 19 ft 3 in with the same water depths and submergences. Increased air rates showed an increase in percent oxygen absorption and transfer capability of the diffusers for all tank geometries, depths, and air rates tested at a fixed water depth and submergence. Adiabatic power requirements of transferring a given amount of oxygen were reduced as tank depths increased, regardless of the tank width. An extrapolation of the data obtained over tank depths of 13-23 ft revealed that advantages of deep tank construction apply to depths significantly greater than 23 ft. The extrapolation also indicated that at some depth beyond 23 ft narrower tanks may require less power for a given oxygen transfer. (Kreager-FIRL)
W76-10226

IMPORTANT CONSIDERATIONS IN DESIGNING ACTIVATED SLUDGE PROCESSES,
Peabody Welles Inc., Roscoe, Ill. Research and Development Div.
J. D. Walker.
Water and Sewage Works, Reference number, p R-54, R-55-R-58, R-60-R-62, April 30, 1976. 5 fig, 1 tab, 1 ref.

Descriptors: *Activated sludge, *Waste water treatment, *Reaeration, Biological treatment, Equipment, Performance, Biochemical oxygen demand, Chemical oxygen demand, Mixing, Design criteria.

Design considerations for air-operated activated sludge processes are discussed. Topics covered include: reaeration, rapid blending of the activated seed sludge with the substrate, air diffuser spacing and placement, clumping tendencies in activated sludge floc, rotary positive blowers, and centrifugal blowers (single stage and multistage). A modification to plug flow activated sludge systems known as complete mixing offers the advantage of blending out high strength, highly soluble biochemical oxygen demand-chemical oxygen demand within the reactor; however, the return seed sludge often requires substantial reaeration to avoid a sludge bulking problem and consequent solids loss to the effluent. The extent of the reaeration should be substantial, for example, at least one-fourth to one-fifth of the detention period, even in plants with high space loadings. Contact stabilization and step feed (both with substantial return activated sludge reaeration) are examples of the application of meaningful reaeration. (Kreager-FIRL)

SMALL SEWAGE WORKS THAT FUNCTION SATISFACTORILY,
Southern Water Authority, East Sussex, (England). East Sussex Water and Drainage Div.
D. H. Banks.
Water Pollution Control, Vol. 75, No. 75, No. 2, p 162-175, 1976. 14 ref.

Descriptors: *Sewage treatment, *Rural areas, *Treatment facilities, *Administration, *Project planning, *Scheduling, Decision making, Economics, *Waste water treatment.
Identifiers: Great Britain, England, Wales.

The status of small rural sewage works throughout England and Wales is reviewed along with options for future design. Over 80% of the more than 5000 sewage treatment plants in England and Wales are administered by rural district councils, indicating the number of smaller sewage treatment plants that have been inherited by 10 newly established water authorities. No radical policy of treatment centralization is expected in view of potential problems associated with constraints in the shape of costly outfall sewers, the possible need for pumping, and the questionable desirability of concentrating effluent discharges into one receiving watercourse. Options available for future sewage works design and construction include: sewage works designed for construction in stages, the design and construction of works with capacities for an ultimate population, and the design of works capable of further expansion. The construction of sewage works which have a life of 30 years or more is considered to be undesirable due to the rate of technological development and change in the sewage treatment field. THAMES WATER OPENS STANFORD RIVERS SEWAGE TREATMENT WORKS,
Water Services, Vol. 80, No. 962, p 248, April, 1976.

Descriptors: *Treatment facilities, *Sewage treatment, *Municipal wastes, *Waste water treatment, Treatment, Equipment, Sludge treatment, Sedimentation, Sewage lagoons, Lagoons.
Identifiers: Great Britain, England.

The opening of the Stanford Rivers Sewage Treatment Works by the Thames Water Authority is described. The new works serve a population of about 12,000 and have a daily inflow of 2500 cu m/day. The sewage treatment works were built in two stages. The first stage involved the provision of a central collection point for sludge treatment and pressing from outlying works and included the construction of sludge holding tanks, mixing tanks, a pumping station, and press house. The second stage called for the rebuilding of treatment facilities to increase capacity and improve the effluent standard and involved the installation of new inlet works, sedimentation tanks, effluent lagoons, a screw pumping house, and ancillary facilities. VIRUS REMOVAL IN AN ACTIVATED SLUDGE PLANT,
Hamilton County Community Development, Tenn.
J. D. Naparstek, K. Kawata, V. P. Olivieri, and V. R. Sherman.
Water and Sewage Works, Reference number, p R-16, R-20, April 30, 1976. 1 fig, 2 tab, 3 ref.

Descriptors: *Activated sludge, *Viruses, *Municipal wastes, *Domestic wastes, *Waste water treatment, Treatment facilities, Evaluation, Performance, Microorganisms, Efficiencies, Wastes, Treatment, Sludge, Chlorination, Chlorine.
Identifiers: f2 virus, *Virus removal.

Virus removal studies at a step aeration activated sludge plant in Maryland City, Maryland were conducted. The plant has a design capacity of 750,000 gallons/day and treats primarily domestic waste from residences along with some commercial waste. An f2 model virus was used to seed the influent of the plant, with the resulting seed virus concentration being 1 million plaque forming units/ml as compared with a background virus concentration of between 100 and 10,000 plaque forming units. The average cumulative virus removal throughout the plant was 80.5%. The most significant virus removals occurred in the plant's chlorine contact basin and averaged 72.0%. Virus reductions in the preliminary units, the primary basin, the aeration tank and secondary basin, and sand filters used throughout the process averaged 7.5, 46.8, 11.1, and 22.2%, respectively. BIOLOGICAL TREATMENT OF WASTE WITH HIGH ASH CONTENT USING A HYDROLYTICALLY ASSISTED EXTENDED AERATION PROCESS,
Oklahoma State Univ., Stillwater. School of Civil Engineering.
A. E. Gaudy, Jr., T. S. Manickam, H. Saidi, and M. P. Reddy.
Biotechnology and Bioengineering, Vol. 18, No. 5, p 701-721, May, 1976. 7 fig, 3 tab, 10 ref.

Descriptors: *Waste water treatment, *Biological treatment, *Activated sludge, *Biochemical oxygen demand, *Chemical oxygen demand, *Suspended solids, Aeration, Digestion.
Identifiers: Ash content, Extended aeration.

A modified extended aeration process for biological treatment of wastes, in which autodigestion was aided and controlled by periodic partial hydrolysis of small portions of the recycle sludge, was previously demonstrated to be feasible using an artificial waste containing little suspended organic solids. To test the process for wastes with high organic feed content and ash content, a 1.5 year pilot study was made using hydrolyzed trickling filter sludge. Analyses were performed for chemical oxygen demand (COD), biochemical oxygen demand (BOD), TOC, suspended solids, ammonia nitrogen, organic-nitrogen, and nitrite-nitrogen. Ash contents in the activated sludge were higher, but did not continually increase or adversely affect the efficiency of organic matter removal. They may have enhanced separation in the final clarifier, since there was little trouble in separating mixed liquor at concentrations over 20,000 mg/liter. COD and suspended solids removal and BOD samples indicated that the system provided waste water purification comparable to other activated sludge processes operating on wastes of much lower ash content. The high dissolved inorganic solids concentration in the effluent is apparently amenable to further physical-chemical treatment. Several further treatment processes were investigated. Ion exchange appears to favorably reduce solids, and, while activated carbon adsorption was relatively ineffective in solids removal, it was extremely effective in removing color. (Snyder-FIRL)

DESIGN CRITERIA FOR MICROSCREENING BIOLOGICAL WASTEWATER PLANT EFFLUENTS,
Ewing Engineering Co., Milwaukee, Wis.
L. Ewing.
Water and Sewage Works, Reference number, p R-94-R-96, R-98-R-101, April 30, 1976. 3 fig, 3 tab, 6 ref.

Descriptors: *Screens, *Biological treatment, *Waste water treatment, *Activated sludge, *Tertiary treatment, Physical properties, On-site investigations, Treatment facilities, Equipment, Performance, Evaluation, Solid wastes, Waste treatment, Treatment, Biochemical oxygen demand, *Design criteria.
Identifiers: Microscreens.

Factors affecting the performance of horizontal rotary drum type microscreens used in biological waste water plants are reviewed along with operating and performance data obtained at two activated sludge plants using microscreens. Major variables affecting the removal efficiency of microscreens and/or effluent quality include: biological loading of the upstream process, final clarifier hydraulic loading, flocculation procedures, hydraulic head across screen media, upstream hydraulics, effectiveness of the solids collection system, media aperture, screen peripheral speed, and raw waste water characteristics. Variables affecting screen capacity expressed as gallons/min/ft of width include: type of biological process and loading, screen influent suspended solids concentration, media effective open area, peripheral speed, effectiveness of cleaning system and solids removal system, head across screen media, media aperture, temperature, and diameter or length of submerged arc. Data obtained from an activated sludge facility using a microscreen for tertiary treatment revealed effluent suspended solids and biochemical oxygen demand concentrations of less than 5 mg/liter under normal operating conditions. The screen successfully handled plant effluents with suspended solid concentrations up to 80 mg/liter. (Kreager-FIRL)

SODIUM BICARBONATE DOSES UPGRADE PLANT TO '77 STANDARDS.
Water and Sewage Works, Reference number, p R-64-R65, April 30, 1976.

Descriptors: *Sewage treatment, *Sodium compounds, *Neutralization, *Alkalinity, *Bicarbonates, Evaluation, On-site investigations, Trickling filters, Performance, *Treatment facilities, Biochemical oxygen demand, Chemical properties, Efficiencies, Sludge, Sludge digestion, Methane, Water quality standards.
Identifiers: *Sodium bicarbonate.

Field tests at a gravity flow trickling filter sewage treatment plant were conducted to assess the effect of sodium bicarbonate addition to the process on the level of biochemical oxygen demand. The addition of 4 lb/hr of sodium bicarbonate to the waste stream as it passed through the bar screen reduced the biochemical oxygen demand from 15-25 mg/liter to less than 10 mg/liter, the latter figure being in compliance with the 1977 Environmental Protection Agency standards. This reduction was the result of the buffering capacity of sodium bicarbonate to neutralize the fatty acids in the waste. Tests involving the addition of 100 lb of sodium bicarbonate to the plant's sludge digester each day were also conducted. This addition resulted in the alkalinity being increased from about 1400-1500 mg/liter to as high as 2500 mg/liter, with the pH being maintained between 6.6 and 6.7. This in turn resulted in better solids/liquid separation, a finer particle cake, less odor, and an increase in methane production from 800-900 cu ft/day to 4000 cu ft/day. (Kreager-FIRL)

EFFECT OF WASTEWATER COMPOSITION AND CELL RESIDENCE TIME ON PHOSPHORUS REMOVAL IN ACTIVATED SLUDGE,
Phillips Petroleum Co., Bartlesville, Okla.
T. R. Stall, and J. H. Sherrard.
Journal Water Pollution Control Federation, Vol. 48, No. 2, p 307-322, February, 1976. 8 fig, 4 tab, 23 ref.

Descriptors: *Waste water treatment, *Biological treatment, *Activated sludge, *Chemical oxygen demand, *Phosphorus, Phosphates, Hydrogen ion concentration, Suspended solids, Microorganisms, Temperature, Analytical techniques.
Identifiers: Cell residence time.

A bench-scale activated sludge unit was operated under closely controlled conditions to study the influence of mean cell residence time and stoichiometric relationships on phosphorus removal. It was operated on a batch basis until the solids concentration reached approximately 1,500 mg/liter, then switched to continuous flow operating conditions. The initial seed of microorganisms was taken from a well-operating experimental activated sludge system. The raw feed solution was tested for chemical oxygen demand, total phosphate phosphorus and pH; the unfiltered effluent for total phosphate-phosphorus, pH, and suspended solids; filtered effluent for COD and soluble phosphate-phosphorus; and the biological reactor for aeration basin ss, total system microorganisms concentration, temperature, and pH. Phosphorus removal efficiencies were higher when mean cell residence time was lower. At any given mean cell residence time, larger COD: phosphorus ratios produced higher phosphorus removal efficiencies. The phosphorus content of the sludge varied between 2.21% and 3.63% on a dry weight basis. Phosphorus removal efficiency and sludge production are directly related. The effective phosphorus removal efficiency is significantly reduced by solids carry-over in the effluent. Biological phosphorus removal may be predicted closely if the cellular phosphorus content and the sludge production are estimated reasonably. Phosphorus may become a limiting nutrient at high COD: phosphorus ratios and low sludge ages, whereas COD is limiting at a high sludge age. (Snyder-FIRL)

FLUCTUATIONS OF THE RUNOFF OF TWO ACTIVATED SLUDGE PLANTS AND ITS CONSEQUENCES FOR THE OBSERVANCE OF LIMIT VALUES (SCHWANKUNGEN DER ABLAEUFE ZWEIER SCHLAMMBELEBUNSANLAGEN UND INRE KONSEQUENZEN FUER DIE EINHALTBARKEIT VON GRENZWERTEN),
H-J. Frenzel, and F. Sarfert.
Gas-und Wasserfach-Wasser/Abwasser, Vol. 117, No. 3, p 123-128, 1976. 10 fig, 6 ref.

Descriptors: *Waste water treatment, *Biological treatment, *Activated sludge, *Biochemical oxygen demand, *Treatment facilities, Potassium compounds, Nitrogen, Phosphates, Runoff.
Identifiers: Dry matter content.

The BOD5 value, the KMnO4 consumption, the total nitrogen content and the phosphate content were measured in the purified effluent from a low-loaded biological waste water treatment plant and from a normally loaded pilot plant in a study on the possibility of observing the limiting values according to Poepel's concept. The BOD5 level, the KMnO4 consumption and the dry matter content were lower in the effluent from the low-leaded treatment plant, while the phosphate content was higher due to the limited mineralization of the activated sludge at the low sludge BOD5 level of about 0.1 kg/kg x day. It was impossible to adopt a limit value which is never exceeded. The compliance with the limit value can be determined by a limited random sampling rather than daily checks. (Takacs-FIRL)

EVALUATION OF THE CIRIA PROTOTYPE MODEL FOR THE DESIGN OF SEWAGE-TREATMENT WORKS,
K. Bowden, R. S. Gale, and D. E. Wright.
Water Pollution Control, Vol. 75, No. 2, p 192-205, 1976. 3 fig, 3 tab, 17 ref.

Descriptors: *Sewage treatment, *Optimization, *Computer programs, *Model studies, *Cost analysis, Waste water treatment, Evaluation, Design criteria, *Treatment facilities.

A prototype computer model for the cost optimization of sewage treatment plant design is presented. Performance relationships for each of the unit processes involved are built into the model; cost data are not incorporated into the model since these vary considerably from site to site and with the degree of inflation. Parameters used for characterizing the process are those used in conventional sewage treatment practice (biochemical oxygen demand, suspended solids, ammonia for liquors, and total solids content and volatile content for sludge). Application of the model is illustrated by an example involving a series of sewage works having different flows but the same series of processes and the same influent and effluent concentrations. (Kreager-FIRL)

CONTRIBUTION TO OPTIMIZING CHEMICAL PRECIPITATION IN UNTREATED WASTE WATER THROUGH CONTROL OF THE ADDED FLOCCULANT QUANTITY (BEITRAG ZUR OPTIMIERUNG CHEMISCHER FAELLUNG IM ROHABWASSER DURCH DIE STEUERUNG DER FAELLMITTELZUGABEMENGE),
H. Overath, and G. Marr.
Gas-und Wasserfach-Wasser/Abwasser, Vol. 117, No. 3, p 109-122, 1976. 15 fig, 5 tab, 42 ref.

Descriptors: *Waste water treatment, *Chemical precipitation, *Flocculation, *Optimization, *Phosphorus, Hydrogen ion concentration, Alkalinity, Electrical conductance, Turbidity.

The influence of different chemical and physical characteristics of untreated municipal waste water on the optimal dosage of flocculant (a by-product from bleaching earth production, a highly acid liquid with A1, Fe, Ca, Mg and C1 ions) was studied in model experiments. The optimal quantity of the flocculant was determined primarily by the phosphorus concentration in the raw waste water. A correlation factor of 0.963 was found for the relationship between phosphorus concentration and the optimal flocculant dose. The correlation factor expressing the relationship between the optimal flocculant dose and the pH value before the flocculant addition is -0.455. A correlation factor of 0.670 was found for the alkalinity. A correlation with the electric conductivity was found to be 0.818. The findings indicate that the electrical conductivity, the standardized alkalinity and turbidity can be used as parameters for the control of the flocculant dosage. (Takacs-FIRL)

VERIFICATION STUDIES OF THE BIOFILM MODEL FOR BACTERIAL SUBSTRATE UTILIZATION,
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
K. Williamson, and P. L. McCarty.
Journal Water Pollution Control Federation, Vol. 48, No. 2, p 281-296, February, 1976. 19 fig, 5 tab, 8 ref.

Descriptors: *Biological treatment, *Waste water treatment, *Model studies, *Kinetics, *Aerobic bacteria, Membranes, Diffusion, *Films.
Identifiers: *Biofilm models.

A verification study was performed for a model describing the kinetics of substrate utilization by biofilms. Aerobic, autotrophic, nitrifying bacteria were used as test organisms. Biofilms were made before each experiment by filtering dispersed bacteria onto membrane filters. The biofilm thickness was determined by examining a side view of the biofilm and the support filter with a microscope and a calibrated ocular micrometer. The diffusion reactor consisted of an enclosed Plexiglas cylinder immersed in an outer vessel. The biofilm model accurately predicted the biofilm substrate utilization rate for deep biofilms that are flux and substrate limited by either an electron donor or an electron acceptor. It was also modified to predict accurately the substrate utilization rate for thin biofilms that were flux and substrate limited by the electron donor and for which the substrate concentrations throughout the biofilm were greater than the half-velocity coefficient. A mathematical relationship was determined indicating whether the biofilm will be flux limited by the electron acceptor or the electron donor. Diffusion coefficients for ammonia, nitrate, nitrite, and oxygen through biofilms of nitrifying bacteria of about 80 to 100% of their corresponding values in water were obtained. (Snyder-FIRL)

PERCOLATION TESTS FOR SEPTIC TANK SUITABILITY IN SOUTHERN ARIZONA SOILS,
Arizona Univ., Tuscon. Dept of Soils, Water, and Engineering.
K. A. Barbarick, A. W. Warrick, and D. F. Post.
Journal of Soil and Water Conservation, Vol. 31, No. 3, p 110-112, May-June, 1976. 2 fig, 4 tab, 20 ref.

Descriptors: *Percolation, *Soil tests, *Septic tanks, Testing procedures, *On-site tests, Soil properties, Subsoil, Sands, Clays, Silts, Gravels, Soil types, Soil chemistry, Hydrogen ion concentration, Electrical conductance, *Arizona, Path of pollutants.

Percolation tests for septic tank suitability were conducted in nine southern Arizona soils to determine relationships between the percolation rate and test-hole diameter and to correlate the rates with selected soil parameters. Both a mathematical relationship and a regression analysis were used to relate percolation rate to test-hole geometry. Percent carbonates varied from 1.6% to 7.4%, pH from 7.7 to 8.1, electrical conductivity from 0.1 to 0.4, and EDTA required for the saturation extract from 0.2 ml to 0.7 ml. The theoretically predicted percolation rate of a 10 cm diameter test-hole was 2.5 times that of a 30 cm hole, an estimate which approximated the experimental results. Variability coefficients for percolation rates at each site ranged between 7% and 48%. Percent sand, clay, and silt in the subsoil correlated significantly with percolation rate. Multiple regression analysis showed that percentages of clay, silt, sand, gravel, and carbonates in subsoil; subsoil pH and electrical conductivity; and amount of EDTA required accounted for 62% of the variation in percolation rates. A variance analysis of soil parameters indicated significant differences among the sites for every parameter. (Snyder-FIRL)

TECHNIQUES FOR POWER MEASUREMENT FOR SURFACE AERATOR,
National Environmental Engineering Research Inst., Nagpur (India).
S. N. Kaul, and V. Raman.
Indian Journal of Environmental Health, Vol. 17, No. 3, p 232-237, 1975. 3 fig, 14 ref.

Descriptors: *Aeration, *Electrical properties, *Efficiencies, *Electrical design, Evaluation, Performance, *Waste water treatment, Equipment, Measurement.
Identifiers: *Surface aerator.

A review of techniques used for measuring the power output from surface aerators is presented along with a comparison of two laboratory methods used for power measurements on full scale aerators. Configurations using an induction motor connected to an alternating current source versus those using a direct current generator as the power source were compared, and the latter type was found more suitable for power input/output and efficiency calculations since it was not affected by frequency changes and skin effects associated with the alternating current configuration. The net power consumed by full-scale aerators was calculated by multiplying the output power by the gear efficiency. (Kreager-FIRL)

TREATMENT OF SYNTHETIC URINOUS WASTEWATER USING COMBINED REVERSE OSMOSIS, IMMOBILIZED UREASE, AND ION EXCHANGE SYSTEMS,
Rutgers - The State Univ., New Brunswick, N. J. Coll. of Engineering.
B. Davidson, W. Vieth, S. Wang, and R. Gilmore, Jr.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A008 947, $6.75 in paper copy, $2.25 in microfiche. 1974, 134 p, 29 fig, 6 tab, 126 ref, 5 append. Prepared for Army Mobility Equipment Research and Development Center, Fort Belvoir, Virginia.

Descriptors: *Waste water treatment, *Sewage treatment, Treatment facilities, *Urine, *Sewage, *Reverse osmosis, *Ion exchange, Membranes, Enzymes, Model studies.
Identifiers: *Urease, Biocatalytic reactors.

A collagen-urease membrane complex of relatively stable enzymatic activity was successfully produced and evaluated for the treatment of urinous waste water. It was evaluated in a spiral wound biocatalytic reactor module integrated into a prototype system containing reverse osmosis and ion exchange processes. A synthetic urinous feed solution containing sodium chloride and urea was used for the evaluation. A transport model based on the assumptions of steady-state, plug-flow, and Michaelis-Menten kinetics and accounting for simultaneous mass transfer and biochemical reaction simulated the performance of the biocatalytic reactor module. The system produced overall urea removals of 75 to 80%. These results are better than can be achieved with a single component system of practical size. Sixty to 80% of the tryptophan was still intact within the matrix in the biocatalytic reactor after intermittent storage and use. An irreversible denaturation of the enzyme must also be occurring in order to account for the decline in enzymatic activity of the collagen-urease membrane complex. The effects of mass transfer were of the same order of magnitude throughout the flow regimes investigated. (Snyder-FIRL)

A PRESENT VALUE-UNIT COST METHODOLOGY FOR EVALUATING WASTEWATER RECLAMATION AND DIRECT REUSE AT A MILITARY BASE OF OPERATIONS,
Army Mobility Equipment Research and Development Center, Fort Belvoir, Va. Sanitary Sciences Div.
V. J. Ciccone.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-A012 175, $3.50 in paper copy, $2.25 in microfiche. December, 1974, 24 p, Report No. 2123, 1 fig, 16 ref.

Descriptors: *Waste water treatment, Analytical techniques, *Water reuse, *Reclamation, *Unit costs, *Cost comparisons, Mathematical models, Computer models, Costs.
Identifiers: Present value-unit cost.

A present value-unit cost (PVUC) methodology was applied to a water supply problem typical for a military base, considering reclamation and direct reuse of treated waste waters. A hierarchy of water use was established, with the highest quality for potable purposes and a lesser quality for non-potable uses. The difference in the calculated unit costs for the alternatives was examined over selected planning horizons, indicating the practicality of a particular quality scheme in the comparison of alternatives. This difference was included in a FORTRAN mathematical model for use on a digital computer. The model selects an optimal water supply system for a military base. The ideas of a dual supply system are incorporated by the reclamation of treated waste waters and the direct reuse of these waters after specified advance treatment. The focus of the model is on the demand for water and alternative methods to satisfy it. The major emphasis is on the role of cost as a determinant. The model essentially consists of a difference equation between the calculated PVUC for each alternative taken over selected planning horizons. A dual water supply system was concluded to be a practical alternative for consideration. The PVUC was a usable measure for evaluating alternatives, and the calculated difference between the PVUC's of two alternatives yielded a worthwhile decision variable, easily calculated with a computer program. The methodology may be applied to existing systems in conjunction with expansion plans or to formulating plans for new military bases. (Snyder-FIRL)

THE DEVELOPMENT OF A SIMPLE WASTE TREATMENT SYSTEM FOR U.S. NAVAL VESSELS,
Denver Research Inst., Denver, Colo.
B. D. Church, L. Griffin, D. Mack, and R. Espinosa.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-A010 233 $4.00 in paper copy, $2.25 in microfiche. Final Report, Office of Naval Research, 1975, 43 p, 11 fig, 6 tab, 14 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Biological treatment, *Treatment facilities, *Chemical oxygen demand, *Sewage, Fermentation, Sludge, Sludge digestion, Organic wastes.

An apparatus was developed in which shipboard wastes containing garbage, sanitary waste, and small amounts of crankcase oil was successfully digested by continuous fermentation. An initial chemical oxygen demand (COD) over 1000 mg/liter decreased to under 100 mg/liter in 6 hr.

LIBRARY U. OF L. ENGINEERING & SCIENCE

The process has potential advantages for scale-up for shipboard waste treatment. A limiting nitrogen level in the raw waste seriously restricted sludge development and waste material oxidation. Adding 0.05% heavy corn steep liquor overcame this problem. The best microbial sludge mass with regard to waste digestion treatment time and floc settling time, a natural enriched mass, developed from the wastes themselves. (Snyder-FIRL)
W76-10256

SYSTEM FOR TOTAL DIRECT RECYCLE OF SECONDARY MUNICIPAL WASTEWATER, VOL I -- DESIGN CONCEPTS,
Houston Research, Inc., Tex.
C. E. Mauk, S. L. Gandhi, and R. W. Legan.
Available from the National Technical Information Service, Springfield, Va 22161, as AD/A-011 938, $6.75 in paper copy, $2.25 in microfiche. Report AFWL-TR-7 4-235, Vol. I June 1975, 157 p, 17 tab, 28 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, Effluents, *Recycling, *Water reuse, Design, Potable water, Tertiary treatment, Reclaimed water, Recirculated water.

The conversion of secondary municipal effluent from an existing conventional waste water treatment facility to a quality suitable for potable use was studied. Over 800 papers and reports on all advanced waste water treatment processes were acquired in a comprehensive literature survey. The important processes were summarized and evaluated. A set of potable water quality criteria parameters was defined for closed loop water reuse. Mathematical performance and cost models were compiled for the individual processes. Both microscreening and multimedia filtration were included for suspended solids removal. Air stripping of ammonia ion exchange by clinoptilolite, and nitrification/denitrification were included for nitrogen removal. Although many municipal plants may already have a lime treatment step or no phosphate problem, phosphate removal by lime treatment was included. Regeneration and nonregeneration of carbon were both considered for the removal of dissolved organic material with activated carbon. Reverse osmosis and ion exchange were included, but not electrodialysis, due to operational problems and the lack of large scale, long term data. While ozone is expected to be more effective and economical for disinfection than chlorine, adding ozone to drinking water is not currently practiced in the United States, and authorities favor chlorine because of its long term residual. Evaporation was used for brine disposal because nonevaporative processes are not generally applicable and may not be allowed in the future. Incineration and nonincineration options were included for sludge disposal. The 14 processes were included in a FORTRAN computer program for performing design calculations of optimal combinations of the processes. (Snyder-FIRL)

WATER REUSE IN THE UNITED STATES,
Aerospace Medical Research Lab., Wright-Patterson AFB, Ohio.
B. H. Pringle.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-A011-856, $3.50 in paper copy, $2.25 in microfiche. EPA Report, December 1974, 89 p 7 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Water reuse, *Sewerage, *Treatment facilities, *Recycling, Pathology, Toxicity, Public health, Water pollution effects, Waste water disposal, United States.
Identifiers: Environmental toxicology.

The demand for water and the level of indirect water reuse in the United States have been increasing. There is also increased interest in direct reuse of treated water for domestic supply. Direct reuse is accomplished by recycling waste treatment plant effluents directly to the water treatment plant; indirect reuse involves the discharge of effluents to bodies or watersheds where it becomes available for use again. Neither the Environmental Protection Agency nor the American Water Works Association approved direct reuse in the early 1970's. Current drinking water standards do not consider the possible toxic elements and compounds likely to be found in waste water. Some of the key health factors to be considered include viruses, bacteria, other microorganisms, chemicals, and the reliability of plant operation. The kind of supply many advocate for reuse with no additional treatment could produce a 30% viral infection rate, and the infected individuals could then infect others. Bacteria, protozoa, and helminthes could also be spread by direct reuse. Most sewage treatment processes remove little of the chemicals disposed of in sewers. Waste water and water treatment plants are not sufficiently reliable. Failsafe treatment operations with monitoring and control should be provided. (Snyder-FIRL)

THIURAM POLYSULFIDE HEAVY METAL REMOVER,
Sagami Chemical Research Center, Tokyo (Japan). (Assignee).
T. Fujisawa, M. Ambe, N. Kobayashi, A. Osawa, and K. Shimizu.
U.S. Patent No. 3,951,790, 7 p, 13 tab, 13 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1342, April 20, 1976.

Descriptors: *Patents, *Water pollution, *Mercury, *Heavy metals, *Waste water treatment, Water pollution treatment, Water quality control, Water pollution sources, Separation techniques, Chemical reactions, Selectivity.

A polymeric compound having thiuram mono- or poly-sulfide linkage shows noteworthy property for removing and collecting heavy metals, especially mercury in any form, from the environment. The compound shows ability to selectively recover some kinds of heavy metals by the selection of appropriate conditions. The heavy metal removers can be used effectively to remove heavy metals in wide pH conditions. The affinities of heavy metals with the compound can vary with the change of conditions and selective removal of specified heavy metals can be achieved by selection of appropriate conditions. However, the removers cannot react with an alkali metal contained in the solution. The reaction products of the heavy metal removers and the heavy metals are, in general, insoluble or sparingly soluble in an aqueous solution, and therefore, the removers can easily be separated and recovered from the treated solution by a conventional procedure, such as filtration, settling, centrifuge and the like. The adoption of a closed system known in the art, such as column system, fixed bed system or fluidized bed system, is preferred. (Sinha - OEIS)

J. L. Azorlosa, and E. P. Williams.
U.S. Patent No. 3,951,792, 4 p, 1 fig, 3 tab, 5 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1343, April 20, 1976.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Industrial wastes, *Chemical wastes, Water pollution treatment, Water pollution control, Water quality control, Flocculation, Suspended solids, Separation techniques, Mineral industry.
Identifiers: Synergistic effect.

The flocculation of solids suspended in an aqueous phase is enhanced by the addition of a flocculation amount of a novel flocculating composition consisting essentially of a blend of from about 2 to about 3 parts by weight of polyvinyl pyrrolidone having a K-value of from about 80 to about 140 and about 1 part by weight of polyethylene imine having a viscosity in 5% aqueous solution at 25 deg C of from about 20 to about 5,000 centipoises. The blend can be added to the aqueous phase either in dry form or as an aqueous solution. The flocculating agents prepared in accordance with this invention may be employed in the flocculation or anionic colloidal dispersions in aqueous systems. They are excellent for precipitating anionic dispersed latices natural and synthetic, sewage for separating sewer sludges, for separating sludges from industrial operations, and in its precipitation of colloidal dispersions of all types having an anionic charge. They are of particular interest in many areas of mineral ore recovery. (Sinha - OEIS)
W76-10468

PROCESS AND APPARATUS FOR TREATING FATTY WASTE WATER,
Alar Engineering Corp., Chicago, Ill. (Assignee).
A. J. Doncer, and H. R. White.
U.S. Patent No. 3,951,795, 12 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1343, April 20, 1976.

Descriptors: *Patents, *Waste water treatment, *Water purification, *Water pollution treatment, Water pollution control, Water quality control, *Lipids, Food-processing industry, Filtration, Sludge disposal, Settling basins, Calcium hydroxide, Chemical reactions.
Identifiers: Grease pits.

The invention relates to a system for treatment of fat containing waste waters produced during normal industrial and commercial scale food-processing operations, including equipment cleanup of processing operations. The system requires no modifications to present plant operations and procedures. The waste water cleanup system may be housed in an integral building structure and placed on top of a grease pit and settling basin, minimizing space requirements and installation costs. The chemical addition system, controls and other components may also be housed in this structure. After filtration, the dry

sludge is conveniently conveyed outside the structure into commercial dry waste disposal containers. Waste water is first mixed with a ferric salt aqueous solution until a pH in the range from about 3 to 5 is achieved. The resulting mixture is then mixed with calcium hydroxide until a pH in the range from about 7 to 8 is achieved. After calcium hydroxide treatment, the resulting so-chemically treated waste waters are maintained in a hold zone which serves multiple functions. Finally the so-chemically treated system is subjected to filtration using a rotary vacuum filter. The product filtered water is characteristically at least sufficiently high in its quality to meet all known governmental standards for water-sewering purposes. (Sinha-OEIS)
W76-10471

PHOTOOXIDATIVE DESTRUCTION OF ORGANIC WASTES,
Charles F. Kettering Foundation, Dayton, Ohio. (Assignee).
G. R. Seely.
U.S. Patent No. 3,951,797, 7 p, 3 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1344, April 20, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Chemical wastes, *Water pollution treatment, Water pollution control, Water quality control, *Oxidation, Dyes, Organic compounds, Phenols, Catalysts.
Identifiers: *Photooxidation, Alginates.

A feasible method of promoting photooxidation of organic waste materials, including phenolic compounds is provided. The method involves the use of gelled metal alginate particles. The particles are stained with an appropriate sensitizing dye which will photocatalytically generate singlet oxygen in the presence of sunlight or artificial light for effective destruction of the oxidizable pollutants contained in the organic wastes. Most organic waste molecules are not destroyed by direct absorption of visible light, but when oxygen is excited to a singlet state, it becomes a strong oxidizing agent capable of oxidizing many ordinarily refractory organic compounds. This invention utilizes those known principles in providing a means to effectively oxidize polluting organic compounds. In addition to providing the known sensitizing function of homogeneous dye systems, the dyestained alginate particles present a heterogeneous phase in which there is no need to separate the dye from the water treated as occurs when a homogeneous dye systems is used. In addition, the particles do not introduce a new toxic material into the environment since alginate is known to be both non-toxic and biodegradable. Likewise, the dyes used are not notably toxic, and are slowly degraded under conditions of use. (Sinha-OEIS)

FILTRATION PROCESS,
Commonwealth Scientific and Industrial Research Organization, Campbell (Australia); and Imperial Chemical Industries of Australia, Campbell; and New Zealand Ltd., Campbell (Australia). (Assignees).
D. E. Weiss, and H. A. J. Battaerd.
U.S. Patent No. 3,951,799, 12 p, 1 fig, 7 tab, 10 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1345, April 20, 1976.

Descriptors: *Patents, *Separation techniques, Oil spills, *Oil pollution, *Wettability, Absorption, *Waste water treatment, Polymers, Magnetic studies, Cooling water, Filtration.
Identifiers: *Phase separation, *Ferromagnetic polymers, Oil slicks.

A process of phase separation comprises the treatment of a mixture of phases with ferromagnetic material in particulate or granular form whereby at least part of one phase of the mixture is absorbed or collected into or onto the particulate or granular material and the separation by magnetic means of the particulate material together with the absorbed or collected portion of the mixture, from the remainder of the mixture. It is preferred to use a synthetic polymer comprising ferromagnetic material. One class of suitable polymers for use in a given multi-phase mixture in which at least one of the phases is a liquid are those which are preferentially wetted by a liquid phase of the mixture. The chemical constitution of the polymers is not critical except insofar as the polymer should have adequate insolubility as well as mechanical and chemical stability in the mixture; the main criterion for selection is wettability. A second class of suitable polymers are those which will preferentially absorb one of the phases of the mixture. Suitable polymers are those which will swell in good solvents for the polymer and will not do so in non-solvents. The efficiency of the process also depends on the size, size distribution and shape of the polymer particles. Relatively coarse particles are best for certain applications such as removing oil slicks from the surface of the sea especially in windy weather. For use as filter aids smaller particles are preferred. The invention is also of use in a liquid/gas phase separation problem encountered in cooling towers. (Sinha-OEIS)
W76-10473

METHOD OF STORING SLUDGE RECOVERED FROM THE HOT WATER EXTRACTION OF BITUMEN FROM TAR SANDS,
Great Canadian Oil Sands Limited, Toronto (Ontario). (Assignee).
J. E. Ashton, and J. Davitt.
U.S. Patent No. 3,951,800, 5 p, 1 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1345, April 20, 1976.

Descriptors: *Patents, *Sludge treatment, *Sludge disposal, *Waste storage, Water pollution control, Water quality control, Bituminous materials, Flocculation, Storage, Settling basins, *Waste water treatment.
Identifiers: Tar sands.

A method for storing bitumen-containing sludge formed in a retention pond used to store effluent discharge recovered from the hot water extraction of bitumen from tar sands also provides for outdoor open storage of sludge in a manner which does not negatively affect the local environment. Sludge which has formed in a quiescent retention pond used for storing effluent discharge is transferred to a storage area comprised of a receiving zone and a storage zone. The receiving zone can be described as a receiving well or tank in which the sludge is first deposited. This receiving zone communicates with the generally larger open storage zone via subsurface openings in a barrier which separates the closed receiving zone from the general storage zone. The open storage zone contains a surface layer of substantially unpolluted water. When entering the storage zone from the receiving well, the sludge displaces the freshwater layer in the storage zone upwardly because of the higher density of the sludge. Thus the sludge storage zone is composed of two layers, an upper surface layer of uncontaminated water and a lower subsurface layer of sludge. By treating the unpolluted surface water layer with a flocculating agent, the intrusion of sludge contamination can be substantially suppressed or diminished. The flocculating agents can be added to the surface water before, during, or after the sludge layer has been introduced into the storage zone. (Sinha-OEIS)

FILTER PRESS,
Gebrueder Bellmer K.G. Maschinenfabrik, Niefern (West Germany). (Assignee).
U. Kollmar.
U. S. Patent No. 3,951,809, 5 p, 2 fig, 13 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1348, April 20, 1976.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Water pollution treatment, Water pollution control, Water quality control, Sludge, Sludge treatment, Filtration, Filters.
Identifiers: Filter presses.

A web filter press is described in which the endless filter webs, after leaving the tapered filtering space, are guided around a so-called dandy roll or pulp roller, whereupon the two webs are guided through several S-shaped runs in which the webs may be deflected over an angle of 90 deg or more. One or both of the endless filter webs include run portions in which they pass over suction boxes so that the suspension is subjected to the suction effect of a negative pressure. Continuously operating web filter presses for the removal of the liquid component from suspensions, such as fiber-containing slurries or sludge are also particularly suitable for the removal of the water from the settling sludge obtained in sewage treatment facilities. (Sinha - OEIS)
W76-10481

MODULAR CONTAINER,
Almag Pollution Control Corp., Baltimore, Md. (Assignee).
A. J. Casolo, and H. Handler.
U. S. Patent No. 3,951,811, 5 p, 4 fig, 17 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1349, April 20, 1976.

Descriptors: *Patents, *Water purification, *Water treatment, *Water pollution treatment, Water pollution control, Water quality control, Filtration, Ion exchange, Resins, *Waste water treatment.
Identifiers: Modular containers, Particulate material.

A modular container includes a housing frame containing particulate material through which contaminated liquid is passed for purposes of purification. The container provides a mechanism whereby contaminated liquid may be introduced, passed through the particulate material and transported out of the container in a somewhat more purified state. The modular container can be utilized to hold particulate material in filtration process systems. In such cases particulate material may be sand, anthracite, or an adsorbing material such as activated carbon. Also the container can be used to maintain particulate material in ion exchange reactions where a number of containers may be arranged in some continuous flow path to provide purification of liquids as a function of ion exchange resinous materials through which the contaminated liquid passes. The invention permits insertion and removal of particulate material without requiring removal of the container from its location in an operating system, or it can be removed from a system and easily replaced to provide decreased ion-exchange system non-operating time. (Sinha - OEIS)

U.S. Patent No. 3,951,816, 4 p, 5 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1350-1351, April 20, 1976.

LIBRARY U. OF I. URBANA-CHAMP.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Oil industry, *Oil pollution, *Water purification, Flotation, Water pollution treatment, Water pollution control, Water quality contrl, Weirs.

In oilfield water flooding operations, which are commonly used as secondary recovery method for crude oil production, oil is produced by injection of water into an oil bearing sand formation to displace the oil and water in the sand formation towards adjacent wells where it is brought to the surface. The oil thus produced is an oil-water mixture containing about 60 to 70% water, and the oil in such production mixtures is normally separated from the water by physical separation means such as settling tanks. The water separated from this mixture still contains on the order of 50 to 500 ppm oil. Consequently, this waste water is subjected to further clan-up operations to remove the residual oil prior to final disposal of the waste water or reusing it in an industrial application. According to the present clarification tank design, water is removed from the cell or tank adjacent the bottom, through a series of pick-up tubes which are connected to a central collection column or plenum chamber which is connected to an external vertical riser through which the clarified water is removed from the central collection tubes. The upper end of the vertical riser is provided with a weir assembly which is vertically adjustable so that the liquid level in the clarification tank can be accurately controlled by adjustment of a single weir. The weir device at the upper end of the riser is a four-sided enclosure positioned over the top of the riser tube to discharge water on all four sides into a weir box which is connected to an outlet tube. Sand and other solid particles settle to the bottom and are withdrawn. (Sinha - OEIS)
W76-10486

CHEVRON CLARIFIER,
M. Bosnjak.
U.S. Patent No. 3,951,818, 7 p, 6 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1351, April 20, 1976.

Descriptors: *Patents, *Water purification, *Waste water treatment, *Separation techniques, Industrial wastes, Food processing industry, Water pollution treatment, Water pollution control, Water quality control, Equipment.
Identifiers: Gravity separation, Sugar beet refineries.

The clarifier provides a vessel having a separation portion within which a number of separation elements are retained in at least one pair of vertical columns. Each separation element has a uniform cross section in the direction of fluid flow which is achieved by the construction of the separation element. Each element generally has a vertically downward extending portion or wing and a downward and outward wing joined at an apex at a predetermined angle. Both wings are generally rectangular in shape. A predetermined number of separation apertures are provided near the apex. Each pair of vertical columns of separation elements is arranged such that the downward wings provide a vertically extending collecting channel through which the clarified liquid will flow. As the substance of heavier density settles toward the bottom of the vessel, a gradient of specific gravity is established between the top and bottom of the vessel, with the top having a lesser specific gravity. As the substance of heavier density settles the specific gravity gradient causes a buoyant or generally upward flow of the liquid as its specific gravity decreases. The upward-flowing liquid encounters the downward and outward wings of the separation filter elements and the buoyancy forces the liquid toward the separation apertures to the collecting channel. The separation apertures restrict the flow into the collecting channel to a slow laminar flow to insure that the particles of heavier density will settle downward against the similar outward and downward jutting wings of the separation element. (Sinha-OEIS)

PHOSPHORUS REMOVAL DEMONSTRATION STUDIES AT C.F.B. TRENTON, PHASE II,
Department of the Environment, Ottawa (Ontario). Wastewater Technology Centre.
W. E. Stepko.
Technology Development Report EPS 4-WP-76-4, Environmental Protection Service April, 1976, 33 p, 9 fig, 8 tab, 11 ref, append.

Descriptors: *Sludge treatment, *Treatment facilities, Sludge, *Waste water treatment, Sewers, Sewage treatment, Sediments, Phosphorus, *Canada.
Identifiers: *Phosphorus removal, Soluble phosphorus, Alum addition.

Full scale phosphorus removal studies, employing alum addition to an activated sludge treatment plant, were conducted at C.F.B. Trenton. Treatment plant performance with respect to total phosphorus removals was closely monitored under a number of alum addition levels and several different alum addition schemes. The optimum alum dosage for phosphorus removal was 1.3 mg/l as Al and the most effective addition scheme was a continuous 24 hour addition to the exit end of the aeration basins. This procedure resulted in a 57% reduction in the alum requirement for phosphorus removal (effluent phosphorus level less than 1 mg/l) and lowered the annual chemical costs from $5,800 to $2,500. Removal of soluble phosphorus above stoichiometric amounts of aluminum was observed during periods of reduced alum dosages. This additional removal is thought to be caused by the strong phosphate binding properties of the recycled alum sludge. The comparison of jar test predictions with plant scale results revealed that the jar test overestimated the optimum alum dosage for phosphorus removal by 500 percent. The choice of a prime precipitant and the determination of the optimum precipitant dosage should be based on plant scale studies rather than jar test predictions. EFFLUENT POLISHING BY FILTRATION THROUGH ACTIVATED ALUMINA, VOLUME I.
Pollutech Pollution Advisory Services Ltd., Oakville, (Ontario).
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 39, Training and Technology Transfer Division (Water), Environmental Protection Service, Environment Canada, Ottawa, Canada, April, 1976, 60 p, 13 fig, 14 tab, 10 ref, append. 73-5-4.

Descriptors: *Filtration, *Waste water treatment, Effluents, Phosphorus, *Efficiencies, Water pollution, Great Lakes, Water quality, Sewage, Nutrients, Economics, *Treatment facilities, Canada.
Identifiers: *Effluent polishing, *Activated alumina columns, Oakville Water Pollution Control Plant(Ontario), Alum treatment, *Phosphorus removal.

The effluent from the Oakville Water Pollution Control Plant was treated with alum to reduce the phosphorus concentration to 1 or 2 mg/l. This pretreated effluent was further polished in activated alumina columns. The phosphorus concentration in the polished effluent depended on the flowrate and the feed phosphorus concentration. Levels of 0.1 mg P/l or less were obtained by this process for appreciable periods. The performance of activated alumina was restored by regeneration with sodium hydroxide after the alumina had been exhausted. This process was estimated to be more economical than alum treatment alone if the desired concentration of phosphorus in the polished effluent was less than 0.5 mg/l. (Environment Canada)

ASSESSMENT OF POLYELECTROLYTES FOR PHOSPHORUS REMOVAL,
McMaster University, Hamilton (Ontario). Dept. of Chemical Engineering.
A. Benedek, A. E. Hameilec, J. J. Bancsi, and T. Ishige.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 37, Training. Technology Transfer Division (Water), Environmental Protection Service, March, 1976, 227 p, 196 fig, 12 tab, 50 ref, 3 append. 72-5-6.

Descriptors: *Polyelectrolytes, Water quality, Great Lakes, *Waste water treatment, Domestic wastes, Surface waters, Effluents, Flocculation, Sediments, Phosphorus, *Chemical precipitation, *Coagulation.
Identifiers: *Phosphorus removal.

A simple batch settling test has been developed to examine the process effectiveness of polyelectrolytes. The conditions for polyelectrolyte testing have been optimized and a theoretical data interpretation technique has been developed to permit the extrapolation of batch data to continuous clarifiers. The shear and chemical degradation of solid polyelectrolyte during dissolution in water has been studied. Serious degradation and loss of effectiveness were noted under high shear, in the presence of ferrous ion, and with long term storage. Polyelectrolyte application in phosphorus removal is expected to occur in conjunction with 'coagulant precipitants' such as alum, ferric chloride and lime. Thus, before assessing the effect of polyelectrolytes, the residual settled phosphorus concentration and the settling rate resulting from the addition of these three coagulant precipitants were studied by themselves in model phosphate solutions as a function of phosphate type, pH and coagulant precipitant dosage. The addition of polyelectrolytes slightly increased the removal of residual phosphorus and dramatically increased settling rates in the model solution systems. With polyelectrolytes, satisfactory performance is anticipated over a much wider pH range. The results of a full scale study indicated agreement within 40% between laboratory predictions and full scale removals in the alum domestic wastewater polyelectrolyte system. (Environment Canada)

DISPOSAL OF SEWAGE FROM COASTAL TOWNS: THE CASE FOR SEA OUTFALLS,
Taylor (John) and Sons, London (England).
J. T. Calvert.
Water Pollution Control, Vol. 75, No. 2, p 153-161, 1976. 6 ref.

Descriptors: *Sewage effluents, *Sewage disposal, *Sewage, *Outlets, *Oceans, Biological properties, Biochemical oxygen demand, Chemical properties, *Outfall sewers.

A case is made for the disposal of sewage from coastal towns via sea outfalls. The case for direct sewage discharge is based on observations of natural purification. When sewage is diluted 100 times with clean seawater, it is indistinguishable from fully treated secondary effluent in terms of bacteriological properties and is superior in quality in terms of suspended solids and biochemical oxygen demand. Subsequent to the dilution, the natural chemical and biological processes of purification occur such that no change in the character and composition of the sea can be detected. Other reasons for favoring direct discharge involve land use requirements for treatment facilities and the costs involved. Direct sewage discharge to the sea also eliminates sludge treatment problems. Exceptions to the above approach which might favor some form of treatment include cases where toxic materials are being discharged, problems involving visible solids, and coastal areas where currents are unfavorable. IMPROVING THE FUEL VALUE OF SEWAGE SLUDGE,
Municipal Environmental Research Lab., Cincinnati, Ohio.
S. W. Hathaway, and R. A. Olexsey.
News of Environmental Research in Cincinnati, October 31, 1975. 4 p, 3 fig, 2 tab, 8 ref.

Descriptors: *Sewage sludge, *Fuels, *Costs, *Incineration, *Sludge disposal, Ultimate disposal, Dewatering, Sludge treatment.

The cost of auxiliary fuel is an increasingly crucial component of the cost of incinerating municipal sewage sludge. Auxiliary fuel is needed because, even after dewatering, more heat is required to evaporate the entrained water than the sludge solids can provide. Sludge volatility also affects the combustibility of the sludge cake. Less expensive alternative auxiliary fuels are being considered, including coal, municipal refuse, wood chips, and paper products. The use of incinerator ash for sludge conditioning does not remove the need for auxiliary fuels, because the ash must be heated and has no beneficial heat value. Sewage sludge is very compressible, and the compressed floc particles hinder dewatering by making the filter medium less porous. Sludge treatment with an incompressible substance is beneficial because it reduces this effect. Granulated coal with a maximum particle size of 9.5 mm, was added to liquid sludge in dosages ranging from 0.2 to 1.0 kg coal/kg dry sludge solids. When coal dosage was above 0.3 kg coal/kg sludge solids, the combustion of the sludge cake provided sufficient energy to supply the heat needed for incineration. The addition of coal in this particle size range did not produce a startling increase in filter yield. Results from a pilot plant show that without polymer, coal addition does not affect the net yield of sludge solids, but that the addition of polymer significantly increases yield. The cost for coal addition is estimated at $10/metric ton dry sludge solids. The cost of oil as a supplementary fuel is estimated at $17.50/metric ton of dry solids. Coal cannot, in itself, serve as a complete conditioning agent. (Snyder-FIRL)

RECLAMATION OF A BURNED ANTHRACITE REFUSE BANK WITH MUNICIPAL SLUDGE,
Pennsylvania State Univ., University Park. School of Forest Resources.
W. E. Sopper, L. T. Kardos, and B. R. Edgerton.
Compost Science, Vol. 17, No. 2, p 12-19, March-April, 1976. 7 tab.

Descriptors: *Sludge disposal, *Land reclamation, *Fertilization, *Application methods, *Sewage effluents, Irrigation, Vegetation establishment, Trees, Grasses, Legumes, Crops, *Municipal wastes.
Identifiers: Land application.

The use of municipal effluent and sludge to fertilize a burned anthracite refuse bank was studied. A burned anthracite refuse bank was divided into three plots, one of which was not irrigated, one irrigated with effluent, and one irrigated with fresh water. Different sludge application rates were used on different parts of each plot. Ten species of trees, five species of grasses, and five species of legumes were planted in the plots. It was shown that heat-dried sludge, municipal sewage effluent, or a combination may successfully revegetate burned anthracite refuse banks. Irrigation with only fresh water was helpful in establishing seeded legumes, but grasses responded more strongly when sludge was also applied. More tree seedlings survived at the lower rates of sludge application. However, the seedlings that survived showed greater height growth at higher application rates. The hardwood trees, especially hybrid poplar and black locust, had greater potential to revegetate burned refuse banks than the conifers. All of the hardwoods had better survival rates than the best conifers. The species with the highest survival rate was black locust. After one season, black locust and hybrid poplar had the greatest height growth. Hardwoods also grow best with a herbaceous cover. The fast growing legumes and grasses quickly overtop and suppress the slowly growing conifers. The best overall sludge application rate was 34 tons/acre in terms of growth of herbaceous vegetation. Eighteen tons/acre was second best for establishing herbaceous vegetation. Grasses were better suited for revegetation than legumes, which responded poorly under competition. (Snyder-FIRL)

LIBRARY U. OF L. ENGINEERING

lentifiers: *Fluidized bed incineration, Orange erbicide.

hermal degradation of liquid wastes in a fluidized ed incineration system was investigated. The astes studied included aircraft washrack waste; aint stripping waste; herbicide orange; petrole-n, oil, and lubricant waste (POL); municipal gar-ge; and sewage sludge. Of these, POL wastes, erbicide orange, a portion of the paint stripping aste, and municipal garbage were identified as els, with enough heat energy to maintain the uidized bed at operating temperature. Use of the uidized bed incinerator to dispose of selected astes was successful. POL and municipal wastes an be used without additional fuel to dispose of rcraft washrack waste, paint stripping wastes, id sewage sludge. Liquid waste fuels were in-cted in the lower 6 inches of the fluidized bed sing the existing oil guns. Other liquid wastes ere injected using the existing feed locations just ove and below the secondary bed. Non-fuel quid wastes could be disposed of at a rate of 148 l/hr in the test system. Existing exhaust emis-on standards were met in all areas except par-culate matter loading. A dry scrubber is recom-ended for use with such systems. Herbicide range can be satisfactorily disposed of providing nission control can be maintained. (Snyder-IRL)

he International Water Quality Symposium is an ducational forum, held on alternate years, which brings together the world's foremost scientists, researches, conservationists, industrialists, government leaders, and others concerned with water quality. The Symposium is designed to translate the technical language of experts into layman's terms and bring to the public the lastest findings on the importance of water quality in such areas as health, environmental protection, sanitation, food processing, as well as various commercial and industrial applications. SOFTENING AND COAGULATION SLUDGE-DISPOSAL FOR A SURFACE WATER SUPPLY,
Stilson (Alden E.) and Associates, Columbus, Ohio.
M. A. Burris, K. W. Cosens, and D. M. Mair.
American Water Works Association Journal, Vol. 68, No. 5, p 247-257, May 1976. 13 fig, 8 tab.

Descriptors: *Water quality control, *Sludge treatment, *Water softening, Surface waters, *Sludge disposal, *Byproducts, Treatment facilities, Calcium carbonate, Lagoons, Magnesium, Recycling, *Water supply, *Water treatment.

Results from pilot plant studies at two surface water treatment plants in Columbus, Ohio, dealing with the feasibility of recovering quicklime from the calcium carbonate in softening sludge as well as methods of sludge disposal are presented. The studies indicate that quicklime which is suitable for reuse can be recovered with an 86% calcium oxide content. Waste streams from centrifugation and sludge concentration processes which contain large quantities of dissolved magnesium require stabilization in lagoons, with the supernatant being returned to the surface stream below the intake dam. Recarbonation, concentration, and centrifuging of softening sludge are required to reduce impurities in the product quicklime in order to ensure continuous high quality for recycling. These steps, together with an efficient first stage clarification process, are essential when a turbid surface water supply is the source. Coagulation sludges must be removed ahead of the softening operation and kept separate. Alum sludges can be concentrated and dewatered by centrifuges or filter presses; the latter produce a more satisfactory cake and a better filtrate for return to the process. (Kreager-FIRL)

CLARIFIER APPARATUS,
Ecodyne Corp., Lincolnshire, Ill. (Assignee).
D. A. Young.
U.S. Patent No. 3,951,806, 4 p, 2 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1347-1348, April 20, 1976.

Descriptors: *Patents, Effluents, *Water purification, *Water treatment, *Water pollution treatment, Water pollution control, Water quality control, Sludge, Coagulation, Suspended solids, Chemicals, Equipment, Chemical precipitation.
Identifiers: Center post clarifier, Chemial treatment.

In water treating and clarification suspended solid particles act as 'seed' or nuclei to which newly formed precipitates adhere, creating a smaller number of larger, more dense and easily settled particles. Previously formed precipitates act as the 'seed' to speed the reactions between the incoming raw water and treatment chemicals. A primary object of the invention is to provide a center post clarifier which hydraulically recirculates solid precipitates or sludge upward into contact with the incoming raw water and added chemical agents. The clarifier has an uptake zone defined around the center support post forming an eductor tube having an upper and lower end which connect with an upper and lower portion of the mixing and recirculation chamber. A first set of openings is provided intermediate the center post for directing the flow of raw water upward into an intermediate portion of the uptake zone. A second set of openings positioned above the first set is provided for directing the remaining flow of raw water from the center post into the upper portion of the uptake zone. The relative flow rates of raw water causes sludge which has accumulated adjacent the lower end of the uptake zone to be lifted and recirculated with the raw water. (Sinh - OEIS)

WATER CONDITIONING APPARATUS,
C. H. Sanderson.
U.S. Patent No. 3,951,807, 5 p, 4 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1348, April 20, 1976.

Descriptors: *Patents, *Water treatment, *Water softening, *Demineralization, Scaling, Water quality, Water quality control, Magnetic studies, Equipment, Desalination.
Identifiers: Magnetic materials, Magnetic field.

An apparatus is described for treating water to reduce the buildup of scale in water systems. The device includes a cylindrical, multipoled magnetic core and an outer casing of magnetic material placed in radially spaced-apart relationship and includes ports for causing the water to pass through the magnetic field between the magnet and the magnetic casing. The passage of water through the apparatus causes materials that ordinarily form scale to form, instead, a loose slurry or mud-like substance which can be easily removed from the system by a simple blowdown or flushing. COMPILATION AND ANALYSIS OF WATER QUALITY RIGHTS AND RESPONSIBILITIES IN HAWAII,
Hawaii Univ., Honolulu. Water Resources Research Center.
H. Yamauchi, and G. M. Hudes.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-254 835, $4.00 in paper copy, $2.25 in microfiche. Technical Memorandum No. 46, February 1976. 33 p., 298 ref. OWRT A-052-HI(1) 14-31-0001-5011.

Descriptors: *Water rights, *Water quality, *Regulation, *Institutions, *Hawaii, Legal aspects, Management, Administration, State jurisdiction, Evaluation, Bibliographies.
Identifiers: *Property rights, *Ahupua'a.

The ahupua'a of ancient Hawaii was a watershed-based institutional community. Water was of cardinal importance as a basis for, and object of the organization and administration of these largely self-sufficient communities. The concepts and doctrines of ahupua'a management, have recently been given reinvigorated legal standing by the 1973 Hanapepe decision of the Hawaii Supreme Court. This initial phase of the project consists of a general description of objectives and a bibliography compiled from library research in the concepts, rights, and responsibilities of the ahupua'a. The Hawaiian Collection of the University of Hawaii, the Bishop Museum, and the State Supreme Court libraries will provide the major information sources. Also maps and boundaries which may indicate additional geopolitical aspects of the ahupua'a will be reviewed.

OPERATION AND IMPACT OF NPDES IN REGION II, PART I,
Environmental Protection Agency, New York. Caribbean Construction Grants Branch.
W. J. Muszynski, and T. J. Olenik.
Water and Sewage Works, Vol. 123, No. 5, p 62-65, May, 1976. 2 tab, 7 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Permits, *Legislation, *Federal Water Pollution Control Act, Standards, Grants, Effluents, New Jersey, New York, Puerto Rico, Virgin Islands, *Water quality standards.
Identifiers: *National Pollutant Discharge Elimination System, Discharge permits.

The Federal Water Pollution Control Act Amendments provide Federal grants for construction of public waste water treatment works and establish interim effluent standards and the National Pollutant Discharge Elimination System (NPDES) permit program. Requirements are provided which systems must meet in order to receive permits. Region II includes Puerto Rico, the United States Virgin Islands, and the states of New York and New Jersey. The initial problems regarding permits for publicly owned discharges involved funding, pre-treatment of industrial wastes, combined flow, and the lack of discharge information. The last is the most serious problem, and it is complicated by the lack of understanding of the permit program by the municipalities. Several reviews of an application are necessary before a permit is issued. The steps in processing a permit include developing a preliminary draft of conditions for the treatment plant, certification by the state, public notice, and issuance of the permit. Attempts are made to verify the information provided on application forms. Where secondary treatment facilities do not currently exist, interim effluent requirements are aligned with the construction schedule for the secondary facilities. Secondary plants capable of achieving the required treatment level would be required to study what could be done to raise their treatment levels. In some instances existing secondary treatment plants would receive two compliance schedules, one related to the permit and the other related to construction grants for plant improvement. (Snyder-FIRL)

FLOATING STRUCTURAL PLASTIC TRUSS SYSTEM PROTECTS WASTE LAGOON LINING,
FMC Corp., San Jose, Calif.
R. K. Andrews.
Water and Sewage Works, Vol. 123, No. 1, p 55, January, 1976.

Descriptors: *Waste treatment, *Corrosion control, *Plastics, Construction Materials, Pipes, Joints(Connections), West Virginia.

A lagoon lining at a facility for waste treatment for a plant in Nitro, West Virginia, had to be designed to protect it from damage. The lagoon was planned to contain acidic wastes in variable depths. Supports and piping were to be designed for corrosion resistance and minimum outdoor maintenance. Structural plastic was designated for outlet and inlet piping supports for this reason. A pivoted truss system and floating platforms were designed and fabricated. A minimum lagoon water level prevents platform floats from resting on the lining. Fiberglass reinforced plastic piping having flexible joints at its truss pivot points was installed. The floating platform gave rise to some stability problems, but these have been corrected. The structural components have not noticeably deteriorated after approximately 2 years' operation. A long useful life is predicted for the system. (nyder-FIRL)

SHORT-TERM REGULATION OF BOD UPSETS IN AN ESTUARY,
Delaware Univ., Newark, Dept. of Chemical Engineering.
R. K. Jain, and M. M. Denn.
Transactions of the ASME: Journal of Dynamic Systems, Measurement, and Control, Vol. 98, No. 1, p 30-31, March, 1976. 1 fig, 5 ref.

Descriptors: *Water quality control, *Mathematical models, *Biochemical oxygen demand, Estuaries, Waste disposal, *Regulation, Water pollution control, Pollution abatement.

Local dynamic regulation at discharge points of effluent biochemical oxygen demand (BOD) upsets in an estuary was studied to determine its feasibility. The study was carried out with a mathematical model for an estuary of constant cross-sectional area, using parameters characteristic of the Delaware estuary. The solution requires the major response to be within the first tidal cycle, but it would be impossible for response to be so rapid in practice. Disturbances die out within approximately 3 days without controls, but averaging extends the period of disturbances to 6 days or more. Thus the spread of poor quality water is increased, although the peak disturbance is considerably reduced. This method of regulation does not appear to be a feasible means of maintaining water quality. (Snyder-FIRL)

ALFALFA SAFEGUARDS GROUND WATER.
Ground Water Age, Vol. 10, No. 9, p 31, May, 1976. 4 fig.

Descriptors: *Water pollution sources, *Nitrogen, *Nitrates, Groundwater, *Decomposing organic matter, *Alfalfa, Corn(Field), Feedlots.
Identifiers: *Abandoned feedlots.

Planting unused feedlots to alfalfa after abandonment will prevent nitrate pollution of ground water that otherwise might occur. It was found that corn is less efficient than alfalfa in removing accumulated nitrogen in the soil. Nitrogen normally builds

p in the top five to six feet of soil in a relatively nmobile form. However, when feedlots are aban-oned, organic nitrogen may be converted to itrate which will infiltrate the soil with moisture nce the impermeable surface seal breaks down. lanting of alfalfa will preclude free nitrogen con-ersion to nitrate by fixing the nitrogen in the root ystem in high concentration. WATER QUALITY IMPLICATIONS OF CAT-TLE GRAZING ON A SEMIARID WATERSHED IN SOUTHEASTERN UTAH,
Oregon State Univ., Corvallis. Rangeland Resources Program.
J. C. Buckhouse, and G. F. Gifford.
Journal of Range Management, Vol. 29, No. 2, p 109-113, March, 1976. 1 fig, 1 tab, 28 ref.

Descriptors: *Public health, *Water quality, *Water pollution control, Watershed management, *Grazing, Coliforms, Cattle, *Range management, Rainfall-runoff relationships, Pine trees, Juniper trees, Land clearing, Human diseases, Recreation facilities, *Utah.
Identifiers: *Fecal pollution.

No adverse effects from fecal contamination were detected after cattle grazing was introduced in a semiarid watershed near Coyote Flat in Southeast-ern Utah. The area was seeded to crested wheat-grass in 1967 after pinyon-juniper chaining and windrowing of debris, and it was protected from grazing until 1974 when it was cattle stocked at 2 ha/AUM. There were no significant changes in fecal and total coliform production, indicating that potential health hazards from fecal pollution dur-ing such grazing are minimal. Most dry rangelands such as those covering the southwestern U.S. have few, if any, permanent streams. Cattle are main-tained by hauling water to troughs or by creating water catchment ponds at local springs. Thus, there is little or no effective stream bank area from which bacteria can be flushed into a water course. On most chainings, especially those with debris in place, runoff water cannot flow any distance over-land and very little rainfall runs off. (Jahns-Arizona)

Descriptors: *Aquiculture, *Waste water treat-ment, *Aquatic productivity, *Nutrient removal, Aquatic animals, Aquatic plants, Nitrogen, Phosphorus, Water quality control, Nutrients, Shellfish, Absorption.
Identifiers: Nutrient recovery.

Aquiculture is evaluated as a means of controlling nitrogen and phosphorus discharges in waste-water. Nutrient recovery provides potential food stuffs return as well as fuel sources and fertilizer compounds. Basic systems are described and cur-rent research outlined, especially with filter-feed-ing shellfish and macroscopic plant forms. Aquiculture system size depends on the area required for plant growth, which is determined by incident solar radiation, the plant species under culture and the efficiency of exposure to sunlight. In research on systems using unmixed basins, area requirements under favorable light conditions ranged from 6 to 60 acres/mgd (for summer opera-tion in the northern U.S. and all year at subtropical latitudes). Area requirements under northern winter conditions may be over 10 times greater. Such requirements may be reduced by culturing a species with higher growth and uptake rates, cul-turing at higher concentrations, and mixing or other methods for increasing light exposure. The use of filter-feeding shellfish requires a heated system; waste heat from power plants is one viable source. Wastewater N:P ratios must be between 10:1 and 15:1 for a species which will uptake both nutrients effectively. (Jahns-Arizona)

A REVIEW ON DECISION MODELS IN ECONOMICS OF REGIONAL WATER QUALI-TY MANAGEMENT,
Technical Univ., of Denmark, Lyngby. Instituttet for Kemundustri.
M. Bundgaard-Nielsen, and C. L. Hwang.
Water Resources Bulletin, Vol. 12, No. 3, p 461-479, June 1976. 5 fig, 94 ref.

Descriptors: *Water quality control, *Management, Economics, *Optimization, *Mathematical models, *Reviews, River basins, Waste water treatment, Decision making, Systems analysis, Linear programming, *Bibliographies, *Regional analysis.
Identifiers: Taxation, Effluent charges, Multiob-jective model, Nonlinear programming, Cen-tralization models, Decentralization models, At-source treatment.

Literature specifically on decision models in economics of regional water quality management is reviewed critically and classified systematically. The concept of a basin-wide firm introduced by Kneese in 1964 is equivalent to the centralization system. Linear programming models for at-source treatment in water pollution control are presented in the earlier studies while nonlinear programming models are in recent ones. Since the economies of scale favor installation of a few large treatment plants, centralized waste treatment systems are studied by many using a number of programming techniques, including integer programming, dynamic programming, a nonconvex quadratic minimization algorithm, and an enumeration method. A general model for the basinwide firm may have the possibility of at-source treatment, centralized waste treatment plants, and by-pass piping to achieve regional water quality standards at a minimum cost. One of the major arguments in support of the taxation approaches is that they can achieve economic efficiency with minimum infor-mation requirements. Finally, it has been increas-ingly recognized that most decision problems in-volve multiple objectives. (Bell-Cornell)

GREAT LAKES POLLUTION CLEANUP STAG-NATES AS PROBLEMS MOUNT,
Engineering News-Record, Vol. 196, No. 22, p 26-27, May 27, 1976. 1 tab.

Descriptors: *Sewage treatment, *Municipal wastes, *Industrial wastes, *Great Lakes, Great Lakes region, Lake Erie, Waste water treatment, Treatment facilities, Water quality, Water pollution effects, Legal aspects, Financing.

Municipal and industrial water pollution problems being experienced by cities on the shores of the Great Lakes are reviewed along with legal, financial, and bureaucratic difficulties impeding their solution. Lake Erie is generally considered to be the most severely polluted of the lakes, with water quality in Cleveland harbor being poor with respect to biochemical oxygen demand, phosphorus, nitrogen, total dissolved solids, and coliforms. A year-long holdup in the building of the city's 50 million gallon/day physical-chemical sewage treatment plant is the result of protests of potential contractors who were beaten out in the bidding. Other delays associated with environmental impact statements required by the Environmental Protection Agency are also a problem. Similar delays are being experienced by other cities on the Great Lakes in terms of deadlines set for both industry and the municipalities. In contrast to the Lake Erie situation, water quality for Lakes Michigan, Superior, and Huron is generally good. (Kreager-FIRL)

PLANNING IMPLICATIONS OF DISSOLVED OXYGEN DEPLETION IN THE WILLAMETTE RIVER, OREGON,
Geological Survey, Portland, Oreg.
D. A. Rickert, W. G. Hines, and S. W. McKenzie.
In: Urbanization and Water Quality Control: American Water Resources Association Proceedings Series No 20, p 70-84, June 1975. 8 fig, 2 tab, 7 ref.

Descriptors: *Water quality control, *Low-flow augmentation, *Rivers, *Oregon, Water analysis, *Dissolved oxygen, Oxygen demand, Nitrification, Summer, Water temperature, Biochemical oxygen demand, Streamflow, Water management(Applied).
Identifiers: *Willamette River(Oreg), River-quality planning, Dissolved oxygen standards.

Basinwide secondary treatment of municipal and industrial wastewaters has resulted in a dramatic increase of summertime dissolved-oxygen (DO) concentrations in the Willamette River in Oregon. Rates of carbonaceous decay are very low (0.03 to 0.06/day), and point-source BOD loading now accounts for less than one-third of the satisfied oxygen demand. Nitrification is now the dominant DO sink. DO concentrations met the state standards in all reaches of the Willamette during the low-flow period of 1974. Mathematical modeling shows that low-flow augmentation from storage reservoirs was largely responsible for the standards being met. Future achievement of DO standards will require continued low-flow augmentation in addition to pollution control. Summertime flows above 6000 cfs will be needed even with increased treatment removals of oxygen-depleting materials. The greatest immediare incremental improvement in DO can be made through reduction in point-source ammonia loading. The pros and cons of upgrading treatment efficiencies for BOD removal would best be determined after ammonia loadings have been reduced to reasonable levels and the possibility of controlling a benthal-oxygen demand in Portland Harbor has been fully assessed. (Woodard-USGS)

THE SYSTEMS CONCEPT AND POLLUTION CONTROL,
San Diego State Univ., Calif.
J. H. Mathewson.
In: Proceedings of the Conference on Marine Biology in Environmental Protection, held at San Clemente Island, California, on 13-15 November, 1973, December, 1974, p 39-44.

Descriptors: Ecosystems, *Monitoring, *Water quality control, *Systems analysis, Abatement, Water pollution, Forecasting, Dynamic programming, Hydrologic systems, Environment, Water pollution control, *Pollution abatement.

An aspect of pollution abatement that has not been adequately recognized is the integrated nature of the problems, the reactions of ecosystems to the problems; and the solutions required to solve the problems. Environments are dynamic systems consisting of complex interactions among many components, with a tendency to maintain themselves in response to outside perturbations. This self-regulating aspect requires the full natural complement of both living and non-living components -- water, light, minerals, plants, animals, microbes -- that interact to make up the whole system. Damage to a single component alters the integrity of the entire system because it reacts as a whole. (See also W76-10353) (Katz)

ANTIFOULING COATINGS AND THEIR INFLUENCE ON THE MARINE ENVIRONMENT,
Naval Postgraduate School, Monterey, Calif.
E. C. Haderlie.
In: Proceedings of the Conference on Marine Biology in Environmental Protection, held at San Clemente Island, California, on 13-15 November, 1973 December, 1974, p 139-145, 6 ref.

Descriptors: *Heavy metals, *Toxicity, *Periphyton, *Fouling, Ships, Aquatic algae, Nuisance algae, Ions, Crustaceans, Water pollution control.

Currently used antifouling coatings owe their effectiveness to the release of the ions of heavy metals into the sea water surrounding the surface protected by the coatings. These ions can contribute significantly to the concentration of heavy metals in the surrounding sea water and can pose a threat to the marine environment. New techniques that do not depend on toxic chemical formulations must be developed to prevent fouling on ships' hulls and other submerged structures. (See also W76-10353) (Katz)

OLLUTION-FREE WELL CUTTINGS ISPOSAL APPARATUS,
L Industries, Inc., New York. (Assignee).
. O. Stearns, and J. A. Gill.
.S. Patent No. 3,901,254, 4 p, 4 fig, 6 ref; Official azette of the United States Patent Office, Vol 7, No 4, p 1245, August 26, 1975.

escriptors: *Patents, *Offshore platforms, *Oil dustry, *Drilling, Exploration, Water pollution urces, Continental Shelf, Oil pollution, Water uality control, Environmental effects, Resources evelopment.
dentifiers: *Outer Continental Shelf, Offshore chnology, Oil slicks, Drilling cuttings.

his invention relates to the art of rotary well illing in offshore locations using oily drilling uids, and more particularly to an apparatus and rocess which permits the economical disposal of ttings without polluting the body of water where e drilling takes place. A partially submerged own pipe extends both above the surface and elow the surface of the water. A cuttings spraying evice receives cuttings which have been eparated from the drilling mud, sprays them with cleaning liquid and discharges them into a flume hich conveys them to the down pipe and scharges them interiorly of the down pipe and elow the surface of the water. The wash or cleang liquid is collected and pumped into a desilting eans such as a cyclone and returned to the ttings washer. A submersible pump within the own pipe at water level or adjacent the water vel serves to pump oil released from the cuttings d which has risen to the level of the top of the uid in the down pipe. An oil-water separator ceives the mixture of oil and water pumped out the down pipe. (Sinha - OEIS)

ALGAE HARVESTER,
J. C. Dodd.
U.S. Patent No. 3,951,805, 5 p, 4 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1347, April 20, 1976.

Descriptors: *Patents, *Algae, *Aquatic algae, Harvesting, Water harvesting, *Harvesting of algae, Water pollution, Water pollution sources, Water pollution control, Water pollution effects, Equipment.
Identifiers: Animal feed.

While the algae harvester can be used in a number of different ways, it has been successfully used in the way described. A main belt is provided of foraminous material preferably fine mesh for retaining or supporting a fibrous precoat but for permitting water or liquids to pass through. The main belt screen is trained over a number of rotary drums and guides. As the belt screen travels clockwise around the rotating forming drum and passes through the aqueous bath, fibrous material is deposited on the outer surface of the belt screen and forms in effect a precoat layer. The water discharges through an outlet line by siphon action or by connection to a low pressure source. Just as the belt screen leaves contact with the drum the belt screen passes over a suction tube within the drum. The precoat thus is subjected to a draining and compacting action through the belt screen and through the perforate drum wall by reason of the vacuum. A good deal of water is withdrawn from the deposited fibrous material which remains on the belt screen. From the idler drum the belt screen descends and advances clockwise in contact with the outer surface of a large filtering drum of foraminous nature and rotating within a tank. The tank is open at one end to a supply of water containing harvestable algae. There is a radially inward flow of water and contained algae, the latter depositing on and in the fiber layer. The separated water is removed from the interior of the drum. This water normally is discharged as treated effluent or filtrate. (Sinha - OEIS)
W76-10478

OIL SKIMMER MODULE WITH FREE FLOATING WEIR TROUGH,
A. J. Crisafulli.
U. S. Patent No. 3,951,810, 5 p, 7 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1349, April 20, 1976.

Descriptors: *Patents, *Oil spills, *Oil pollution, Water pollution treatment, *Water pollution control, Water quality control, *Skimming, Weirs, Flow, Equipment, *Separation techniques.
Identifiers: Gravity flow, Oil slicks, Skimmers.

A skimmer is provided by which floating pollutants such as oil along with a thin layer of water can be collected into a sump box or receptacle and then pumped to a storage tank or the like to enable separation of the pollutants and the water after which the water may be returned to the body of water. The sump box is provided with an opening below the water level to enable gravity flow of water and floating pollutants into the sump box. A weir placed in the opening in the sump box controls the quantity of water and pollutants discharged into the sump box. The weir is defined by an edge or edges of float supported members that can move in relation to the sump box to maintain a predetermined relationship to the surface of the body of water and includes flexible means between the sump box and weir to facilitate conveyance of the water and pollutants into the sump box. (Sinha - OEIS)
W76-10482

COALESCING UNIT FOR GRAVITY SEPARATOR,
Minnesota Mining and Mfg. Co., St. Paul. (Assignee).
D. L. Krueger.
U. S. Patent No. 3,951,814, 7 p, 7 fig, 1 ref; Official Gazette of the United States Patent Office, Vol 945, No 3, p 1350, April 30, 1976.

Descriptors: *Patents, *Oil spills, *Oil pollution, *Water pollution treatment, *Separation techniques, Water quality control, Water pollution control, Dispersion, Sorption, Coalescence.
Identifiers: Oil slicks, Dispersed liquid phase, Continuous liquid phase.

A separator removes a dispersed liquid phase from a continuous liquid phase. The separator is comprised of a housing having an inlet, an outlet, and a separation chamber between the inlet and outlet through which the liquid passes; and a separator element that tightly occupies the inside of the separation chamber. The separator element has discrete sections of two different kinds of media which are coalescing and sorbing media, interspersed in intimate contact with one another. The coalescing media has less resistance to liquid flow that the sorbing media, and extends through the separator element from the point at which the liquid enters to the point at which the liquid leaves the separator elements so as to establish substantially continuous, thin, minimal-pressure-drop channels through the element. The sorbing media is wetted by the dispersed liquid phase in preference to being wetted by the continuous liquid phase, so that the dispersed liquid phase is sorbed into the sorbing media. The most common liquid to be treated is oil-contaminated water, but coalescing and sorbing media are available for treating other liquids also. A separator element is typically used to treat a liquid containing small amounts of a dispersed liquid phase, but it may also be used to treat a more heavily contaminated liquid for a shorter period of time, as when bilge water is removed from a ship or when water carrying an oil slick is treated. (Sinha - OEIS)
W76-10484

HARVEST OF BIOLOGICAL PRODUCTION AS A MEANS OF IMPROVING EFFLUENTS FORM SEWAGE LAGOONS,
J. H. Neil.
Canada-Ontario Agreement on the Great Lakes Water Quality, Research Report No. 38, Training and Technology Transfer Division (Water), Environmental Protection Service, Environment Canada, Ottawa, Canada, 1976, 35 p, 38 ref, 9 tab.

Descriptors: *Sewage lagoons, Harvesting, *Harvesting of algae, Effluents, Great Lakes, *Phosphorus, *Nitrogen, *Organic matter, Algae, Zooplankton, Midges, Ponds, Lagoons, *Waste water treatment, Water pollution control, Daphnia, Midges.
Identifiers: Duckweed, *Biological harvesting, Raw sewage.

The feasibility of removing phosphorus, nitrogen and organic matter through the harvesting of algae, duckweek (Lemna sp.), daphnia (Cladocera) or midge larvae (Tendipedidae) has been examined using analytical information from five Ontario sewage lagoons and information on production and chemical composition of the biota derived from the literature. Effluent analyses showed that an average of 1.7 ppm more total phosphorus must be removed to meet a 1 ppm total phosphorus standard for effluents. Harvesting part of the algae or duckweed crop could provide this reduction. Production figures from the literature indicate daphnia culture would provide the necessary removal from two to five lagoons. One instance where midge larvae production for an Ontario lagoon could be calculated indicated that a three-fold increase in standing crop would be required. Daphnia and midge larvae would provide immediately useful products for fish culture, the value of which could be used to offset part of harvesting and sewage treatment costs. Possible means of increasing production and harvesting methods are discussed. The culture and harvest of aquatic organisms provide additional benefits through the removal of nitrogen and other sewage constituents, and their culture is proposed as a possible alternative to the chemical precipitation practices currently in use. (Environment Canada)

6. WATER RESOURCES PLANNING

6A. Techniques Of Planning

AN LP-10 MODEL FOR COORDINATING MULTI-GROUP INPUTS IN RESOURCE PLANNING,
Hawaii Univ., Honolulu.
T. Liang.
Water Resources Bulletin, Vol. 12, No. 3, p 601-624, June 1976. 14 fig, 6 tab, 9 ref.

Descriptors: *Water resources development, *Comprehensive planning, *Linear programming, Natural resources, Optimization, Regional analysis, Resource allocation, Water quality, Economics, Water supply, Water demand, Social aspects, Constraints, Equations, Systems analysis, Mathematical models, Alternative planning.
Identifiers: *Multiple-input planning, Hydrographic areas, Kauai County(Hawaii).

The need for a model to quickly assess the impact of one or many proposals has never been greater, since the planning process has become open to almost everyone. The great magnitude of inputs to a planning process in terms of number and the degree of difference requires a model to resolve the difference, evaluate their overall impact, and finally coordinate the inputs into a meaningful as well as acceptable plan to all. Resources planning, perhaps exceeding any other planning process with respect to the great number of divergent opinions from a wide spectrum of specialist and citizen groups, probably needs such a model the most. This paper reports on the development of a linear programming model for guiding public as well as multi-discipline inputs in the planning and management of water and related natural resources. Optimal location of economic activities can be achieved by iterative use of the model. Kauai County, Hawaii is used in an example which illustrates the model use. (Bell-Cornell)

URBAN SERVICE PRICING AND LAND USE: SOME PRELIMINARY RESULTS,
Virginia Univ., Charlottesville. Dept. of Environmental Sciences.
S. S. Skjei, and R. Freed.
Water Resources Bulletin, Vol. 12, No. 3, p 547-560, June 1976.

Descriptors: *Land use, *Pricing, Water resources, Control, Demand, Supply, Taxes, Economics, Regression analysis, Equations, Mathematical models, Urbanization, Cities, Municipal water.
Identifiers: *Economic analysis, Goods and services, *Public policy, Households, Utility function.

The use of public policy variables to control urban land use has been suggested or implied by a number of authors. This paper presents a conceptual foundation for doing so and the results of some empirical analyses based on this foundation. The conceptual analysis, based on a general equilibrium model of an urban economy, suggests functional forms which would appear to be of use and value in the developmental consequences brought about by changes in policy variables over which local units of government have control. Despite multicollinearity, regression analyses reveal that a statistically significant relationship does exist between characteristics of urban form and development and many local governmental policy variables. The method developed herein appears to constitute an alternative to more expensive approaches to the analysis of the relation between policy variables and land use. The empirical results tend to support earlier suggestions advanced by other researchers. (Bell-Cornell)

Descriptors: *Management, Lakes, *Lake shores, *Information exchange, *Massachusetts, *Research priorities, Legislation.
Identifiers: *Lake rehabilitation.

A seminar was conducted in a series of eight sessions during the spring of 1975. Its major objectives were the following: (1) Identify lake problems and possible components of a conjunctive university, state, regional and local program to prevent problems or provide timely control of problems. Such a program might include requirements for data systems, predictive modelling, governance mechanisms, and lake rehabilitation. (2) Provide a basis for effective, continuing exchange of information between university group and public agencies on lake-related problems and research programs. (3) Help formulate research priorities and mechanisms for joint university-public agency research undertakings. (4) Provide a proposal for legislation or other public action designated to protect Massachusetts lakes. The report provides a set of general as well as specific recommendations for strengthening lake-shoreland management in Mass.; also included is a Draft Lake-Shoreland Regulation Bill.

Identifiers: Ecosystem analysis, South Florida ecosystem, Snook, Ten Thousand Islands, Fahkahatchee Strand, *Big Cypress Swamp(Fla).

A two year study was conducted to obtain biological and hydrological information on south Florida's land, water, wildlife and fisheries resources. Field investigations during 1971-72 intensively examined the details of biotic community interactions with hydrologic conditions of disturbed and relatively unaffected regions of the Big Cypress Swamp and contiguous tidal wetlands and estuaries. Study results demonstrate the total dependence of the South Florida ecosystem on the hydroperiod. Canal drainage of upland wetlands which include cypress swamps and wet-prairies effected a 10 fold decrease in primary productivity. Drainage also effected a thinning of the forest canopy and induced a reduction in the rate of forest litter decomposition resulting in a buildup of litter as increased fuel for destructive wildfires. LIBRARY U. OF I. URBANA-CHAMPAIGN

sis, Precipitation(Atmospheric), *Data processing, Adaptation, Forecasting.
Identifiers: *HYDRO programming system.

The HYDRO programming system consists of a library of computer sub-programs which have been assembled and modified to process hydraulic and hydrologic data under a common format. A total of twenty-five sub-programs are presently included in the system, each of which falls under one of the following categories: precipitation analyses, frequency analyses, hydrograph analyses, or open channel hydraulics. The twenty-five sub-programs selected provide a broad look at many of the more common problems encountered in the field today. They are intended to introduce the basic system to the engineer, satisfy many of his present needs, and be flexible enough to enable the timely inclusion of future programs.

SELECTED STREAMFLOW EXPERIENCE GRAPHS FOR SOUTHWESTERN PENNSYLVANIA,
Geological Survey, Harrisburg, Pa.
R. M. Beall.
Open-file report, April 1976. 40 p, 37 fig, 1 tab, 5 ref.

Descriptors: *Streamflow forecasting, *Flow characteristics, *Flow rates, *Statistical methods, *Pennsylvania, Systems analysis, Regression analysis, Data collections, Gaging stations, Hydrologic data, Hydrographs, Duration curves.
Identifiers: *Streamflow experience graphs(PA).

Standard streamflow characteristics commonly derived from data sequences include means and standard deviations of annual or monthly flows, low flows or flood volumes of given durations and return periods, and annual flood peaks of given return periods. This report describes and illustrates another analytical/statistical technique, the probability analysis of daily flows recorded during a long period of record, graphically presented in the form of a duration hydrograph. Such hydrographs are given for 34 streamflow records for gaging stations within the upper Ohio River basin principally in southwestern Pennsylvania. Because this method of analysis summarizes and classifies many years of discharge records on a day-to-day basis, its results can be viewed as an experience graph. Some operations and management applications are suggested. (Woodard-USGS)

RECONNAISSANCE DATA ON LAKES IN WASHINGTON--VOLUME 6. ADAMS, BENTON, DOUGLAS, FRANKLIN, GRANT, LINCOLN, WALLA WALLA, AND WHITMAN COUNTIES,
Geological Survey, Tacoma, Wash.
N. P. Dion, G. C. Bortleson, J. B. McConnell, and L. M. Nelson.
Washington Department of Ecology Olympia, Water-supply Bulletin 43, Vol 6, 1976. 407 p, 1 fig, 15 ref.

Descriptors: *Lakes, *Lake morphology, *Lake morphometry, *Water quality, *Washington, *Data collections, Bathymetry, Aerial photography, Lake shores, *Mapping, Water analysis, Physical properties, Chemical analysis.
Identifiers: Southeastern Washington lakes.

A total of 178 lakes in eight counties (Adams, Benton, Douglas, Franklin, Grant, Lincoln, Walla Walla, and Whitman) of southeastern Washington was sampled using helicopter or boat to obtain information on lake physical, cultural, and water-quality conditions. Physical parameters were determined from topographic and bathymetric (bottom-contour) maps of the lakes. If bathymetric maps were not available, the lakes were sounded and charted using a continuous-recording fathometer. By use of aerial photographs and lake depths, the bathymetric data were digitized and transferred to computer cards which served as input to a computerized program that calculated lake morphometric parameters (for example, lake volume, surface area, and length of shoreline). Vertical profiles of temperature and dissolved oxygen were measured in the deepest part of each lake. Secchi-disc visibility was determined also. Water samples were collected for color, nutrient, and specific-conductance analyses at depths 3.0 feet below the water surface and 3-5 feet above the lake bottom. Samples for fecal-coliform bacteria were collected at selected nearshore sites, approximately 100 feet offshore at a depth of 1 foot below the water surface. (Woodard-USGS)
W76-10138

RECONNAISSANCE DATA ON LAKES IN WASHINGTON--VOLUME 7. PEND OREILLE, SPOKANE, AND STEVENS COUNTIES,
Geological Survey, Tacoma, Wash.
N. P. Dion, G. C. Bortleson, J. B. McConnell, and L. M. Nelson.
Washington Department of Ecology Olympia, Water-Supply Bulletin 43, Vol 7, 1976. 267 p, 1 fig, 16 ref.

Descriptors: *Lakes, *Lake morphology, *Lake morphometry, *Water quality, *Washington, *Data collections, Bathymetry, Aerial photography, Lake shores, *Mapping, Water analysis, Physical properties, Chemical analysis.
Identifiers: Northeastern Washington lakes.

A total of 90 lakes in three counties (Pend Oreille, Spokane, and Stevens) of northeastern Washington was sampled using helicopter or boat to obtain information on lake physical, cultural, and water-quality conditions. Physical parameters were determined from topographic and bathymetric (bottom-contour) maps of the lakes. If bathymetric maps were not available, the lakes were sounded and charted using a continuous-recording fathometer. By use of aerial photographs and lake depths, the bathymetric data were digitized and transferred to computer cards which served as input to a computerized program that calculated lake morphometric parameters (for example, lake volume, surface area, and length of shoreline). Vertical profiles of temperature and dissolved oxygen were measured in the deepest part of each lake. Secchi-disc visibility was determined also. Water samples were collected for color, nutrient, and specific-conductance analyses at depths 3.0 feet below the water surface and 3-5 feet above the lake bottom. Samples for fecal-coliform bacteria were collected at selected nearshore sites, approximately 100 feet offshore at a depth of 1 foot below the water surface. (Woodard-USGS)

HYDROLOGIC DATA FOR URBAN STUDIES IN THE FORT WORTH, TEXAS METROPOLITAN AREA, 1974,
Geological Survey, Austin, Tex.
R. M. Slade Jr., and J. M. Taylor.
Open-file report, May 1976. 100 p, 3 fig, 5 tab.

Descriptors: *Hydrologic data, *Storms, *Rainfall-runoff relationships, *Small watersheds, *Urban runoff, *Texas, Streamflow, Basic data collections, Gaging stations, Rain gages, Peak discharge, Hydrographs, Mass curves.
Identifiers: *Fort Worth(Tex).

This report, which is the sixth in a series of reports published annually for the Fort Worth, Texas, area, presents basic hydrologic data collected in four study areas during the 1974 water year (October 1, 1973 to September 30, 1974). The four study areas within the metropolitan area are Sycamore Creek, Sycamore Creek tributary, Dry Branch, and Little Fossil Creek. Each year, storm events are selected for detailed rainfall-runoff analysis. The event during which the annual maximum discharge occurs is usually included in the selection. During the 1974 water year, storms selected for analysis occurred on October 11, October 12-13, 1973, and June 12, 1974 in the Sycamore Creek basin; October 11, 1973, June 7, and August 10, 1974 in the Sycamore Creek tributary basin; October 12-13, 1973, August 26-27, and September 20-21, 1974 in the Dry Branch basin; October 12-13, 1973, August 26, and September 20-21, 1974 in the Little Fossil Creek basin. Summaries of storm rainfall-runoff data for selected individual storms at streamflow stations and crest-stage partial-record stations are given. Detailed storm rainfall and runoff records, hydrographs, and mass curves for each station are shown. (Woodard-USGS)
W76-10141

SALT-LOAD COMPUTATIONS--COLORADO RIVER; CAMEO, COLORADO TO CISCO, UTAH: PART 1. DATA SUMMARY,
Geological Survey, Denver, Colo.
R. Brennan, and R. U. Grozier.
Open-file report, 1976. 15 p, 3 fig, 6 tab.

Descriptors: *Salts, *Movement, *Water quality, *Colorado River, *Streamflow, Basic data collections, Discharge(Water), Chemical analysis, Correlation analysis, Gaging stations, Flow rates, Calcium, Magnesium, Harkness(Water), Sodium, Bicarbonates, Chloride, Dissolved solids, Specific conductivity.
Identifiers: *Salt-load computations.

Salt-load computations for inflow and outflow stations in the Grand Valley area of Colorado have been computed using five methods. The salt-load increase of the Colorado River from the Grand Valley has been computed for the Colorado-Utah State line station and the Colorado River near Cisco, Utah, station. Most of the salt loads give values about +30 percent of the average for all methods used, but differences of 70 percent do occur. Records presented in the basic-data report are regression curves of discharge versus specific conductance and of specific conductance versus calcium, magnesium, hardness, sodium, bicarbonate, chloride, dissolved solids, and sulfate; duration tables of daily discharge and of daily specific conductance for the period of record; and the daily specific-conductance data for the period of record for all stations in the study area. (See also W76-10143) (Woodard-USGS)
W76-10142

SALT-LOAD COMPUTATIONS--COLORADO RIVER; CAMEO, COLORADO, TO CISCO, UTAH: PART 2. BASIC DATA,
Geological Survey, Denver, Colo.
R. Brennan, and R. U. Grozier.
Open-file report, 1976. 222 p, 54 fig, 12 tab.

Descriptors: *Salts, Movement, *Water quality, *Colorado River, *Streamflow, Basic data collections, Discharge(Water), Chemical analysis, Correlation analysis, Gaging stations, Flow rates, Calcium, Magnesium, Hardness(Water), Sodium, Bicarbonates, Chloride, Dissolved solids, Specific conductivity, *Utah, *Colorado.
Identifiers: *Salt-load computations.

Basic data for the salt-load computations, Colorado River, Cameo, Colo., to Cisco, Utah, consists of regression curves of discharge versus specific conductance and specific conductance versus calcium, magnesium, hardness, sodium, bicarbonate, chloride, dissolved solids, and sulfate; duration tables of daily discharge and

daily specific conductance at six stream-gaging sites; and daily specific-conductance data for the period of record for all stations in the study area. Location of streamflow and water-quality stations are shown on a map. (See also W76-10142) (Woodard-USGS)
W76-10143

HYDROLOGIC DATA FOR LITTLE ELM CREEK, TRINITY RIVER BASIN, TEXAS, 1974,
Geological Survey, Austin, Tex.
R. M. Slade , Jr., and J. M. Taylor.
Open-file report, May 1976. 73 p, 2 fig, 3 tab.

Descriptors: *Hydrologic data, *Streamflow, *Flow rates, *Flood control, *Small watersheds, Texas, Basic data collections, Watershed management, Rainfall, Runoff, Storms, Gaging stations, Water storage, Flood protection.
Identifiers: *Elm Creek(Tex), *Trinity River basin(Tex).

This report, which is the fifteenth in a series of basic-data reports published annually for the Little Elm Creek study area, contains the rainfall, runoff, and storage data collected during the 1974 water year for the 75.5 sq mi area above the stream-gaging station Little Elm Creek near Aubrey, Texas. The locations of floodwater-retarding structures and hydrologic-instrument installations in the area are shown. The average rainfall above the stream-gaging station Little Elm Creek near Aubrey (study area) during the water year was 43.18 inches, or 115 percent of the 18-year (1957-74) average of 37.58 inches. Monthly rainfall totals ranged from 0.82 inch in March to 7.55 inches in June. The yearly mean discharge was 74.6 cfs. Three storm periods were selected for detailed computations. These computations include a time breakdown of rainfall and discharge with hydrographs and mass curves drawn for illustrations. (Woodard-USGS)
W76-10144

HYDROLOGIC DATA FOR URBAN STUDIES IN THE AUSTIN, TEXAS METROPOLITAN AREA, 1974,
Geological Survey, Austin, Tex.
R. N. Mitchell.
Open-file report, May 1976. 60 p, 3 fig, 1 tab.

Descriptors: *Hydrologic data, *Storms, *Rainfall-runoff relationships, *Small watersheds, *Urban runoff, *Texas, Basic data collections, Gaging stations, Rain gages, Streamflow, Peak discharge, Hydrographs, Mass curves.
Identifiers: *Austin(Tex).

Rainfall and runoff data are presented for Waller Creek and Wilbarger Creek, Texas, for the 1974 water year (October 1, 1973 to September 30, 1974). The Waller Creek drainage area lies entirely within the city of Austin, with the headwaters originating in the northern part of the city. The creek flows south for 6.6 miles to the Colorado River. Storm sewers and street gutters divert runoff both into and out of the natural drainage area. The headwaters of Wilbarger Creek originate in Travis County near the Williamson County line. The creek flows southeasterly about 40 miles to the Colorado River. The Wilbarger Creek study area is about 15 miles north of the city of Austin. The weighted-mean rainfall in the Waller Creek area upstream from 23d Street was 38.40 in., or 18 percent above the mean annual rainfall for Austin of 32.49 in. Mean daily discharge was 4.12 cfs; annual runoff was 13.54 in., or 35 percent of rainfall. Four storm periods for the Waller Creek area, October 11, 1973; October 12-13, 1973; May 9, 1974; and August 28-29, 1974 were selected for analysis. Weighted-mean rainfall in the Wilbarger Creek area was 31.63 in., or 3 percent below the mean annual rainfall for Austin. Mean daily discharge was 1.72 cfs; annual runoff was 5.05 in., or 16 percent of rainfall. Two storm periods for the Wilbarger Creek area, October 11, 1973 and October 13, 1973 were selected for analysis. A summary of rainfall-runoff data for each storm is shown. Computations with hydrograph and mass curves for each storm are included. (Woodard-USGS)
W76-10145

HYDROLOGIC DATA FOR COW BAYOU, BRAZOS RIVER BASIN, TEXAS, 1974,
Geological Survey, Austin, Tex.
J. K. VanZandt.
Open-file report, May 1976. 63 p, 3 fig, 3 tab.

Descriptors: *Hydrologic data, *Streamflow, *Basic data collections, *Flood control, *Small watersheds, *Texas, Watershed management, Rainfall, Runoff, Gaging stations, Storms, Water storage, Flood protection.
Identifiers: *Cow Bayou watershed(Tex), Brazos River basin(Tex).

This report, which is the fourteenth in a series of basic-data reports published annually for the Cow Bayou study area, contains the rainfall, runoff, and storage data collected during the 1974 water year for the 85.0 sq mi area above the stream-gaging station Cow Bayou at Mooreville, Texas. The location of floodwater-retarding structures and hydrologic instruments in the area are shown. The weighted-mean rainfall over the study area during the water year was 31.61 inches, or 95 percent of the 16-year (1959-74) average of 33.13 inches. Monthly rainfall ranged from 0.58 inch in December to 7.93 inches in October. Yearly mean discharge at the stream-gaging station was 18.4 cfs, compared with the 16-year average of 35.0 cfs. Annual runoff at the stream-gaging station was 13,330 acre-ft. For the water year, one storm (Oct. 11, 1973) was selected for detailed computation. (Woodard-USGS)
W76-10146

HYDROLOGIC DATA FOR NORTH CREEK TRINITY RIVER BASIN, TEXAS, 1974,
Geological Survey, Austin, Tex.
C. C. Kidwell.
